Assembly Bill No. 1739

CHAPTER 347

An act to amend Sections 65352 and 65352.5 of, and to add Section 65350.5 to, the Government Code, and to amend Sections 348, 1120, 1552, 1831, 10721, 10726.4, and 10726.8 of, to add Sections 1529.5 and 10726.9 to, to add Part 5.2 (commencing with Section 5200) to Division 2 of, and to add Chapter 7 (commencing with Section 10729), Chapter 8 (commencing with Section 10730), Chapter 9 (commencing with Section 10732), Chapter 10 (commencing with Section 10733), and Chapter 11 (commencing with Section 10735) to Part 2.74 of Division 6 of, the Water Code, relating to groundwater.

[Approved by Governor September 16, 2014. Filed with Secretary of State September 16, 2014.]

LEGISLATIVE COUNSEL'S DIGEST

AB 1739, Dickinson. Groundwater management.

(1) Existing law authorizes local agencies to adopt and implement a groundwater management plan. Existing law requires a groundwater management plan to contain specified components and requires a local agency seeking state funds administered by the Department of Water Resources for groundwater projects or groundwater quality projects to do certain things, including, but not limited to, preparing and implementing a groundwater management plan that includes basin management objectives for the groundwater basin.

This bill would provide specific authority to a groundwater sustainability agency, as defined in SB 1168 of the 2013–14 Regular Session, to impose certain fees. The bill would authorize the department or a groundwater sustainability agency to provide technical assistance to entities that extract or use groundwater to promote water conservation and protect groundwater resources. This bill would require the department, by January 1, 2017, to publish on its Internet Web site best management practices for the sustainable management of groundwater, and would require the department to prepare and release a report by December 31, 2016, on the department’s best estimate of water available for replenishment of groundwater in the state.

This bill would require a groundwater sustainability agency to submit a groundwater sustainability plan to the department for review upon adoption. This bill would require the department to periodically review groundwater sustainability plans, and by June 1, 2016, would require the department to adopt certain regulations. This bill would authorize a local agency to submit to the department for evaluation and assessment an alternative that the local agency believes satisfies the objectives of these provisions. This bill would require the department to review any of the above-described submissions at least every 5 years after initial submission to the department.

This bill would authorize the board to conduct inspections and would authorize the board to obtain an inspection warrant. Because the willful refusal of an inspection lawfully authorized by an inspection warrant is a misdemeanor, this bill would impose a state-mandated local program by expanding the application of a crime.

This bill would authorize the board to designate a basin as a probationary basin if the board makes a certain determination. This bill would authorize the board to develop an interim plan for a probationary basin if the board, in consultation with the department, determines that a local agency has not remedied a deficiency that resulted in designating the basin as a probationary basin within a certain timeframe. This bill would authorize the board to adopt an interim plan for a probationary basin after notice and a public hearing and would require state entities to comply with an interim plan. This bill would specifically authorize the board to rescind all or a portion of an interim plan if the board determines at the request of specified petitioners that a groundwater sustainability plan or adjudication action is adequate to eliminate the condition of long-term overdraft or condition where groundwater extractions result in significant depletions of interconnected surface waters. This bill would provide that the board has authority to stay its proceedings relating to an interim plan or to rescind or amend an interim plan based on the progress made by a groundwater sustainability agency or in an adjudication action.

(2) Existing law establishes the Water Rights Fund, which consists of various fees and penalties. The moneys in the Water Rights Fund are available, upon appropriation by the Legislature, for, among other things, the administration of the State Water Resource Control Board's water rights program.

This bill would provide that the moneys in the Water Rights Fund are available for expenditure, upon appropriation by the Legislature, for the purpose of state board enforcement of the provisions of this bill. This bill would require the board to adopt a schedule of fees in an amount sufficient to recover all costs incurred and expended from the Water Rights Fund by the board for this bill.

Under existing law, a person who violates a cease and desist order of the board may be liable in an amount not to exceed $1,000 for each day in which the violation occurs. Revenue generated from these penalties is deposited in the Water Rights Fund.

This bill would authorize the board to issue a cease and desist order in response to a violation or threatened violation of any decision or order of the board or any extraction restriction, limitation, order, or regulation adopted or issued under the provisions of this bill.

(3) Existing law, with certain exceptions, requires each person who diverts water after December 31, 1965, to file with the State Water Resources Control Board a prescribed statement of diversion and use. Existing law subjects a person to civil liability if that person fails to file, as required, a diversion and use statement for a diversion or use that occurs after January 1, 2009, tampers with any measuring device, or makes a material misstatement in connection with the filing of a diversion or use statement. Existing law provides that the making of any willful misstatement in connection with these provisions is a misdemeanor punishable as prescribed.

This bill would establish groundwater reporting requirements for a person extracting groundwater in an area within a basin that is not within the management area of a groundwater sustainability agency or a probationary basin. The bill would require the reports to be submitted to the board or, in certain areas, to an entity designated as a local agency by the board, as specified. This bill would require each report to be accompanied by a specified fee. This bill would apply the above-described criminal and civil liability provisions to a report or measuring device required by this reporting requirement. By expanding the definition of a crime, this bill would impose a state-mandated local program.

Existing law authorizes the board or the Department of Water Resources to adopt emergency regulations providing for the filing of reports of water diversion or use that are required to be filed.

This bill would authorize the board or the department to adopt emergency regulations providing for the filing of reports of water extraction.

(4) Existing law requires the legislative body of each county and city to adopt a comprehensive, long-term general plan for the physical development of the county or city with specified elements, including, among others, land use and conservation elements. Existing law requires a city or county, upon the adoption or revision of its general plan, on or after January 1, 1996, to utilize as a source document any urban water management plan submitted to the city or county by a water agency.

This bill would require, prior to the adoption or any substantial amendment of a general plan, the planning agency to review and consider a groundwater sustainability plan, groundwater management plan, groundwater management court order, judgment, or decree, adjudication of water rights, or a certain order or interim plan by the State Water Resources Control Board. This bill would require the planning agency to refer a proposed action to adopt or substantially amend a general plan to any groundwater sustainability agency that has adopted a groundwater sustainability plan or local agency that otherwise manages groundwater and to the State Water Resources Control Board if it has adopted an interim plan that includes territory within the planning area.

Existing law requires a public water system to provide a planning agency with certain information upon receiving notification of a city's or a county's proposed action to adopt or substantially amend a general plan.

This bill would also require a groundwater sustainability agency or an entity that submits an alternative to provide the planning agency with certain information as is appropriate and relevant, including a report on the anticipated effect of the proposed action on implementation of a groundwater sustainability plan.

By imposing new duties on a city or county, this bill would impose a state-mandated local program.

(5) Senate Bill 1168 of the 2013–14 Regular Session, if enacted, would enact the Sustainable Groundwater Management Act, and would define “undesirable result” for purposes of those provisions. The act would grant specified authority to a groundwater sustainability agency relating to controlling groundwater extractions, and would specify that various provisions do not supersede the land use authority of cities and counties, as specified.

This bill would revise the definition of “undesirable result,” and would specify that certain authority granted to a groundwater sustainability agency to control groundwater extractions shall be consistent with applicable elements of a city or county general plan, except as specified. The bill would provide that the provisions against superseding the land use authority of cities and counties apply to that authority within the overlying basin, including the city or county general plan, and would require a groundwater sustainability plan to take into account the most recent planning assumptions stated in local general plans overlying the basin.

(6) The California Constitution requires the state to reimburse local agencies and school districts for certain costs mandated by the state. Statutory provisions establish procedures for making that reimbursement.

This bill would provide that with regard to certain mandates no reimbursement is required by this act for a specified reason.

With regard to any other mandates, this bill would provide that, if the Commission on State Mandates determines that the bill contains costs so mandated by the state, reimbursement for those costs shall be made pursuant to the statutory provisions noted above.

(7) Existing constitutional provisions require that a statute that limits the right of access to the meetings of public bodies or the writings of public officials and agencies be adopted with findings demonstrating the interest protected by the limitation and the need for protecting that interest.

This bill would make legislative findings to that effect.

(8) This bill would make its operation contingent on the enactment of SB 1168 of the 2013–14 Regular Session.

DIGEST KEY

Vote: MAJORITY   Appropriation: NO   Fiscal Committee: YES   Local Program: YES

BILL TEXT

THE PEOPLE OF THE STATE OF CALIFORNIA DO ENACT AS FOLLOWS:

SECTION 1.

(a) The Legislature finds and declares as follows:

(1) The people of the state have a primary interest in the protection, management, and reasonable beneficial use of the water resources of the state, both surface and underground, and that the integrated management of the state’s water resources is essential to meeting its water management goals.

(2) Groundwater provides a significant portion of California’s water supply. Groundwater accounts for more than one-third of the water used by Californians in an average year and more than one-half of the water used by Californians in a drought year when other sources are unavailable.

(3) Excessive groundwater extraction can cause overdraft, failed wells, deteriorated water quality, environmental damage, and irreversible land subsidence that damages infrastructure and diminishes the capacity of aquifers to store water for the future.

(4) When properly managed, groundwater resources will help protect communities, farms, and the environment against prolonged dry periods and climate change, preserving water supplies for existing and potential beneficial use.

(5) Failure to manage groundwater to prevent long-term overdraft infringes on groundwater rights.

(6) Groundwater resources are most effectively managed at the local or regional level.

(7) Groundwater management will not be effective unless local actions to sustainably manage groundwater basins and subbasins are taken.

(8) Local and regional agencies need to have the necessary support and authority to manage groundwater sustainably.

(9) In those circumstances where a local groundwater management agency is not managing its groundwater sustainably, the state needs to protect the resource until it is determined that a local groundwater management agency can sustainably manage the groundwater basin or subbasin.

(10) Information on the amount of groundwater extraction, natural and artificial recharge, and groundwater evaluations are critical for effective management of groundwater.

(11) Sustainable groundwater management in California depends upon creating more opportunities for robust conjunctive management of surface water and groundwater resources. Climate change will intensify the need to recalibrate and reconcile surface water and groundwater management strategies.

(12) Sustainability groundwater management is part of implementation of the California Water Action Plan.

(b) It is, therefore, the intent of the Legislature to do all of the following:

(1) To provide local and regional agencies the authority to sustainably manage groundwater.

(2) To provide that if no local groundwater agency or agencies provide sustainable groundwater management for a groundwater basin or subbasin, the state has the authority to develop and implement an interim plan until the time the local groundwater sustainability agency or agencies can assume management of the basin or subbasin.

(3) To require the development and reporting of those data necessary to support sustainable groundwater management, including those data that help describe the basin's geology, the short- and long-term trends of the basin's water balance, and other measures of sustainability, and those data necessary to resolve disputes regarding sustainable yield, beneficial uses, and water rights.

(4) To respect overlying and other proprietary rights to groundwater, consistent with Section 1200 of the Water Code.

(5) To recognize and preserve the authority of cities and counties to manage groundwater pursuant to their police powers.

SEC. 2.

Section 65350.5 is added to the Government Code, to read:

65350.5.

Before the adoption or any substantial amendment of a city's or county's general plan, the planning agency shall review and consider all of the following:

(a) An adoption of, or update to, a groundwater sustainability plan or groundwater management plan pursuant to Part 2.74 (commencing with Section 10720) or Part 2.75 (commencing with Section 10750) of Division 6 of the Water Code or groundwater management court order, judgment, or decree.

(b) An adjudication of water rights.

(c) An order or interim plan by the State Water Resources Control Board pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code.

SEC. 3.

Section 65352 of the Government Code is amended to read:

65352.

(a) Before a legislative body takes action to adopt or substantially amend a general plan, the planning agency shall refer the proposed action to all of the following entities:

(1) A city or county, within or abutting the area covered by the proposal, and any special district that may be significantly affected by the proposed action, as determined by the planning agency.

(2) An elementary, high school, or unified school district within the area covered by the proposed action.

(3) The local agency formation commission.

(4) An areawide planning agency whose operations may be significantly affected by the proposed action, as determined by the planning agency.

(5) A federal agency, if its operations or lands within its jurisdiction may be significantly affected by the proposed action, as determined by the planning agency.

(6) (A) The branches of the United States Armed Forces that have provided the Office of Planning and Research with a California mailing address pursuant to subdivision (d) of Section 65944, if the proposed action is within 1,000 feet of a military installation, or lies within special use airspace, or beneath a low-level flight path, as defined in Section 21098 of the Public Resources Code, and if the United States Department of Defense provides electronic maps of low-level flight paths, special use airspace, and military installations at a scale and in an electronic format that is acceptable to the Office of Planning and Research.

(B) Within 30 days of a determination by the Office of Planning and Research that the information provided by the Department of Defense is sufficient and in an acceptable scale and format, the office shall notify cities, counties, and cities and counties of the availability of the information on the Internet. Cities, counties, and cities and counties shall comply with subparagraph (A) within 30 days of receiving this notice from the office.

(7) A public water system, as defined in Section 116275 of the Health and Safety Code, with 3,000 or more service connections, that serves water to customers within the area covered by the proposal. The public water system shall have at least 45 days to comment on the proposed plan, in accordance with subdivision (b), and to provide the planning agency with the information set forth in Section 65352.5.

(8) Any groundwater sustainability agency that has adopted a groundwater sustainability plan pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code or local agency that otherwise manages groundwater pursuant to other provisions of law or a court order, judgment, or decree within the planning area of the proposed general plan.

(9) The State Water Resources Control Board, if it has adopted an interim plan pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code that includes territory within the planning area of the proposed general plan.

(10) The Bay Area Air Quality Management District for a proposed action within the boundaries of the district.

(11) A California Native American tribe that is on the contact list maintained by the Native American Heritage Commission and that has traditional lands located within the city's or county's jurisdiction.

(12) The Central Valley Flood Protection Board for a proposed action within the boundaries of the Sacramento and San Joaquin Drainage District, as set forth in Section 8501 of the Water Code.

(b) An entity receiving a proposed general plan or amendment of a general plan pursuant to this section shall have 45 days from the date the referring agency mails it or delivers it to comment unless a longer period is specified by the planning agency.

(c) (1) This section is directory, not mandatory, and the failure to refer a proposed action to the entities specified in this section does not affect the validity of the action, if adopted.

(2) To the extent that the requirements of this section conflict with the requirements of Chapter 4.4 (commencing with Section 65919), the requirements of Chapter 4.4 shall prevail.

SEC. 4.

Section 65352.5 of the Government Code is amended to read:

65352.5.

(a) The Legislature finds and declares that it is vital that there be close coordination and consultation between California's water supply or management agencies and California's land use approval agencies to ensure that proper water supply and management planning occurs to accommodate projects that will result in increased demands on water supplies or impact water resource management.

(b) It is, therefore, the intent of the Legislature to provide a standardized process for determining the adequacy of existing and planned future water supplies to meet existing and planned future demands on these water supplies and the impact of land use decisions on the management of California's water supply resources.

(c) Upon receiving, pursuant to Section 65352, notification of a city's or a county's proposed action to adopt or substantially amend a general plan, a public water system, as defined in Section 116275 of the Health and Safety Code, with 3,000 or more service connections, shall provide the planning agency with the following information, as is appropriate and relevant:

(1) The current version of its urban water management plan, adopted pursuant to Part 2.6 (commencing with Section 10610) of Division 6 of the Water Code.

(2) The current version of its capital improvement program or plan, as reported pursuant to Section 31144.73 of the Water Code.

(3) A description of the source or sources of the total water supply currently available to the water supplier by water right or contract, taking into account historical data concerning wet, normal, and dry runoff years.

(4) A description of the quantity of surface water that was purveyed by the water supplier in each of the previous five years.

(5) A description of the quantity of groundwater that was purveyed by the water supplier in each of the previous five years.

(6) A description of all proposed additional sources of water supplies for the water supplier, including the estimated dates by which these additional sources should be available and the quantities of additional water supplies that are being proposed.

(7) A description of the total number of customers currently served by the water supplier, as identified by the following categories and by the amount of water served to each category:

(A) Agricultural users.

(B) Commercial users.

(C) Industrial users.

(D) Residential users.

(8) Quantification of the expected reduction in total water demand, identified by each customer category set forth in paragraph (7), associated with future implementation of water use reduction measures identified in the water supplier’s urban water management plan.

(9) Any additional information that is relevant to determining the adequacy of existing and planned future water supplies to meet existing and planned future demands on these water supplies.

(d) Upon receiving, pursuant to Section 65352, notification of a city’s or a county’s proposed action to adopt or substantially amend a general plan, a groundwater sustainability agency, as defined in Section 10721 of the Water Code, or an entity that submits an alternative under Section 10733.6 shall provide the planning agency with the following information, as is appropriate and relevant:

(1) The current version of its groundwater sustainability plan or alternative adopted pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code.

(2) If the groundwater sustainability agency manages groundwater pursuant to a court order, judgment, decree, or agreement among affected water rights holders, or if the State Water Resources Control Board has adopted an interim plan pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code, the groundwater sustainability agency shall provide the planning agency with maps of recharge basins and percolation ponds, extraction limitations, and other relevant information, or the court order, judgment, or decree.

(3) A report on the anticipated effect of proposed action to adopt or substantially amend a general plan on implementation of a groundwater sustainability plan pursuant to Part 2.74 (commencing with Section 10720) of Division 6 of the Water Code.

SEC. 5.

Section 348 of the Water Code is amended to read:

348.

(a) The department or the board may adopt emergency regulations providing for the electronic filing of reports of water extraction or water diversion or use required to be filed with the department or board under this code, including, but not limited to, any report required to be filed under Part 5.1 (commencing with Section 5100) or Part 5.2 (commencing with Section 5200) of Division 2 and any report required to be filed by a water right permittee or licensee.

(b) Emergency regulations adopted pursuant to this section, or any amendments thereto, shall be adopted by the department or the board in accordance with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code. The adoption of these regulations is an emergency and shall be considered by the Office of Administrative Law as necessary for the immediate preservation of the public peace, health, safety, and general welfare. Notwithstanding Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code, any emergency regulations or amendments to those regulations adopted under this section shall remain in effect until revised by the department or the board that adopted the regulations or amendments.

SEC. 6.

Section 1120 of the Water Code is amended to read:

1120.

This chapter applies to any decision or order issued under this part or Section 275, Part 2 (commencing with Section 1200), Part 2 (commencing with Section 10500) of Division 6, Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6, Article 7 (commencing with Section 13550) of Chapter 7 of Division 7, or the public trust doctrine.

SEC. 7.

Section 1529.5 is added to the Water Code, to read:

1529.5.

(a) The board shall adopt a schedule of fees pursuant to Section 1530 to recover costs incurred in administering Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6. Recoverable costs include, but are not limited to, costs incurred in connection with investigations, facilitation, monitoring, hearings, enforcement, and administrative costs in carrying out these actions.

(b) The fee schedule adopted under this section may include, but is not limited to, the following:

(1) A fee for participation as a petitioner or party to an adjudicative proceeding.

(2) A fee for the filing of a report pursuant to Part 5.2 (commencing with Section 5200) of Division 2.

(c) Consistent with Section 3 of Article XIII A of the California Constitution, the board shall set the fees under this section in an amount sufficient to cover all costs incurred and expended from the Water Rights Fund for the purposes of Part 5.2 (commencing with Section 5200) and Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6. In setting these fees, the board is not required to fully recover these costs in the year or the year immediately after the costs are incurred, but the board may provide for recovery of these costs over a period of years.

SEC. 8.

Section 1552 of the Water Code is amended to read:

1552.

The money in the Water Rights Fund is available for expenditure, upon appropriation by the Legislature, for the following purposes:

(a) For expenditure by the State Board of Equalization in the administration of this chapter and the Fee Collection Procedures Law (Part 30 (commencing with Section 55001) of Division 2 of the Revenue and Taxation Code) in connection with any fee or expense subject to this chapter.

(b) For the payment of refunds, pursuant to Part 30 (commencing with Section 55001) of Division 2 of the Revenue and Taxation Code, of fees or expenses collected pursuant to this chapter.

(c) For expenditure by the board for the purposes of carrying out this division, Division 1 (commencing with Section 100), Part 2 (commencing with Section 10500) and Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6, and Article 7 (commencing with Section 13550) of Chapter 7 of Division 7.

(d) For expenditures by the board for the purposes of carrying out Sections 13160 and 13160.1 in connection with activities involving hydroelectric power projects subject to licensing by the Federal Energy Regulatory Commission.

(e) For expenditures by the board for the purposes of carrying out Sections 13140 and 13170 in connection with plans and policies that address the diversion or use of water.

SEC. 9.

Section 1831 of the Water Code is amended to read:

1831.

(a) When the board determines that any person is violating, or threatening to violate, any requirement described in subdivision (d), the board may issue an order to that person to cease and desist from that violation.

(b) The cease and desist order shall require that person to comply forthwith or in accordance with a time schedule set by the board.

(c) The board may issue a cease and desist order only after notice and an opportunity for hearing pursuant to Section 1834.

(d) The board may issue a cease and desist order in response to a violation or threatened violation of any of the following:

(1) The prohibition set forth in Section 1052 against the unauthorized diversion or use of water subject to this division.

(2) Any term or condition of a permit, license, certification, or registration issued under this division.

(3) Any decision or order of the board issued under this part, Section 275, Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6, or Article 7 (commencing with Section 13550) of Chapter 7 of Division 7, in which decision or order the person to whom the cease and desist order will be issued, or a predecessor in interest to that person, was named as a party directly affected by the decision or order.

(4) A regulation adopted under Section 1058.5.

(5) Any extraction restriction, limitation, order, or regulation adopted or issued under Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6.

(e) This article does not authorize the board to regulate in any manner, the diversion or use of water not otherwise subject to regulation of the board under this part.

SEC. 10.

Part 5.2 (commencing with Section 5200) is added to Division 2 of the Water Code, to read:

PART 5.2. Groundwater Extraction Reporting for Probationary Basins and Basins Without a Groundwater Sustainability Agency

5200.

The Legislature finds and declares that this part establishes groundwater reporting requirements for the purposes of subdivision (b) of Section 10724 and Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6.

5201.

As used in this part:

(a) “Basin” has the same meaning as defined in Section 10721.

(b) “Board-designated local area” has the same meaning as defined in Section 5009.

(c) “De minimis extractor” has the same meaning as defined in Section 10721.

(d) “Groundwater” has the same meaning as defined in Section 10721.

(e) “Groundwater extraction facility” has the same meaning as defined in Section 10721.

(f) “Groundwater sustainability agency” has the same meaning as defined in Section 10721.

(g) “Person” has the same meaning as defined in Section 10735.

(h) “Personal information” has the same meaning as defined in Section 1798.3 of the Civil Code.

(i) “Probationary basin” has the same meaning as defined in Section 10735.

(j) “Water year” has the same meaning as defined in Section 10721.

5202.

(a) This section applies to a person who does either of the following:

(1) Extracts groundwater from a probationary basin 90 days or more after the board designates the basin as a probationary basin pursuant to Section 10735.2.

(2) Extracts groundwater on or after July 1, 2017, in an area within a basin that is not within the management area of a groundwater sustainability agency and where the county does not assume responsibility to be the groundwater sustainability agency, as provided in subdivision (b) of Section 10724.

(b) Except as provided in subdivision (c), a person subject to this section shall file a report of groundwater extraction by December 15 of each year for extractions made in the preceding water year.

(c) Unless reporting is required pursuant to paragraph (2) of subdivision (c) of Section 10735.2, this section does not apply to any of the following:

(1) An extraction by a de minimis extractor.

(2) An extraction excluded from reporting pursuant to paragraph (1) of subdivision (c) of Section 10735.2.

(3) An extraction reported pursuant to Part 5 (commencing with Section 4999).

(4) An extraction that is included in annual reports filed with a court or the board by a watermaster appointed by a court or pursuant to statute to administer a final judgment determining rights to water. The reports shall identify the persons who have extracted water and give the general place of use and the quantity of water that has been extracted from each source.

(d) Except as provided in Section 5209, the report shall be filed with the board.

(e) The report may be filed by the person extracting water or on that person’s behalf by an agency that person designates and that maintains a record of the water extracted.

(f) Each report shall be accompanied by the fee imposed pursuant to Section 1529.5.

5203.

Each report shall be prepared on a form provided by the board. The report shall include all of the following information:

(a) The name and address of the person who extracted groundwater and of the person filing the report.

(b) The name of the basin from which groundwater was extracted.

(c) The place of groundwater extraction. The location of the groundwater extraction facilities shall be depicted on a specific United States Geological Survey topographic map or shall be identified using the California Coordinate System or a latitude and longitude measurement. If assigned, the public land description to the nearest 40-acre subdivision and the assessor’s parcel number shall be provided.

(d) The capacity of the groundwater extraction facilities.

(e) Monthly records of groundwater extractions. The measurements of the extractions shall be made by a methodology, water-measuring device, or combination thereof satisfactory to the board.

(f) The purpose of use.

(g) A general description of the area in which the water was used. The location of the place of use shall be depicted on a specific United States Geological Survey topographic map or on any other maps with identifiable landmarks. If assigned, the public land description to the nearest 40-acre subdivision and the assessor’s parcel number shall also be provided.

(h) As near as is known, the year in which the groundwater extraction was commenced.

(i) Any information required pursuant to paragraph (3) of subdivision (c) of Section 10735.2.

(j) Any other information that the board may require by regulation and that is reasonably necessary for purposes of this division or Part 2.74 (commencing with Section 10720) of Division 6.

5204.

(a) If a person fails to file a report as required by this part, the board may, at the expense of that person, investigate and determine the information required to be reported pursuant to this part.

(b) The board shall give a person described in subdivision (a) notice of its intention to investigate and determine the information required to be reported pursuant to this part and 60 days in which to file a required report without penalty.

5205.

A report submitted under this part or a determination of facts by the board pursuant to Section 5104 shall not establish or constitute evidence of a right to divert or use water.

5206.

Personal information included in a report of groundwater extraction shall have the same protection from disclosure as is provided for information concerning utility customers of local agencies pursuant to Section 6254.16 of the Government Code.

5207.

A right to extract groundwater that may otherwise occur shall not arise or accrue to, and a statute of limitations shall not operate in favor of, a person required to file a report pursuant to this part until the person files the report.

5208.

Section 5107 applies to a report or measuring device required pursuant to this part. For purposes of Section 5107, a report of groundwater extraction, measuring device, or misstatement required, used, or made pursuant to this part shall be considered the equivalent of a statement, measuring device, or misstatement required, used, or made pursuant to Part 5.1 (commencing with Section 5100).

5209.

For groundwater extractions in a board-designated local area, reports required pursuant to this part shall be submitted to the entity designated pursuant to subdivision (e) of Section 5009 if both of the following occur:

(a) The board determines that the requirements of subdivision (e) of Section 5009 have been satisfied with respect to extractions subject to reporting pursuant to this part, in addition to any groundwater extractions subject to Part 5 (commencing with Section 4999).

(b) The designated entity has made satisfactory arrangements to collect and transmit to the board any fees imposed pursuant to paragraph (2) of subdivision (b) of Section 1529.5.

SEC. 11.

Section 10721 of the Water Code, as added by Senate Bill 1168 of the 2013–14 Regular Session, is amended to read:

10721.

Unless the context otherwise requires, the following definitions govern the construction of this part:

(a) “Adjudication action” means an action filed in the superior or federal district court to determine the rights to extract groundwater from a basin or store water within a basin, including, but not limited to, actions to quiet title respecting rights to extract or store groundwater or an action brought to impose a physical solution on a basin.

(b) “Basin” means a groundwater basin or subbasin identified and defined in Bulletin 118 or as modified pursuant to Chapter 3 (commencing with Section 10722).

(c) “Bulletin 118” means the department’s report entitled “California’s Groundwater: Bulletin 118” updated in 2003, as it may be subsequently updated or revised in accordance with Section 12924.

(d) “Coordination agreement” means a legal agreement adopted between two or more groundwater sustainability agencies that provides the basis for coordinating multiple agencies or groundwater sustainability plans within a basin pursuant to this part.

(e) “De minimis extractor” means a person who extracts, for domestic purposes, two acre-feet or less per year.

(f) “Governing body” means the legislative body of a groundwater sustainability agency.

(g) “Groundwater” means water beneath the surface of the earth within the zone below the water table in which the soil is completely saturated with water, but does not include water that flows in known and definite channels.

(h) “Groundwater extraction facility” means a device or method for extracting groundwater from within a basin.

(i) “Groundwater recharge” means the augmentation of groundwater, by natural or artificial means.

(j) “Groundwater sustainability agency” means one or more local agencies that implement the provisions of this part. For purposes of imposing fees pursuant to Chapter 8 (commencing with Section 10730) or taking action to enforce a groundwater sustainability plan, “groundwater sustainability agency” also means each local agency comprising the groundwater sustainability agency if the plan authorizes separate agency action.

(k) “Groundwater sustainability plan” or “plan” means a plan of a groundwater sustainability agency proposed or adopted pursuant to this part.

(l) “Groundwater sustainability program” means a coordinated and ongoing activity undertaken to benefit a basin, pursuant to a groundwater sustainability plan.

(m) “Local agency” means a local public agency that has water supply, water management, or land use responsibilities within a groundwater basin.

(n) “Operator” means a person operating a groundwater extraction facility. The owner of a groundwater extraction facility shall be conclusively presumed to be the operator unless a satisfactory showing is made to the governing body of the groundwater sustainability agency that the groundwater extraction facility actually is operated by some other person.

(o) “Owner” means a person owning a groundwater extraction facility or an interest in a groundwater extraction facility other than a lien to secure the payment of a debt or other obligation.

(p) “Personal information” has the same meaning as defined in Section 1798.3 of the Civil Code.

(q) “Planning and implementation horizon” means a 50-year time period over which a groundwater sustainability agency determines that plans and measures will be implemented in a basin to ensure that the basin is operated within its sustainable yield.

(r) “Public water system” has the same meaning as defined in Section 116275 of the Health and Safety Code.

(s) “Recharge area” means the area that supplies water to an aquifer in a groundwater basin.

(t) “Sustainability goal” means the existence and implementation of one or more groundwater sustainability plans that achieve sustainable groundwater management by identifying and causing the implementation of measures targeted to ensure that the applicable basin is operated within its sustainable yield.

(u) “Sustainable groundwater management” means the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results.

(v) “Sustainable yield” means the maximum quantity of water, calculated over a base period representative of long-term conditions in the basin and including any temporary surplus, that can be withdrawn annually from a groundwater supply without causing an undesirable result.

(w) “Undesirable result” means one or more of the following effects caused by groundwater conditions occurring throughout the basin:

(1) Chronic lowering of groundwater levels indicating a significant and unreasonable depletion of supply if continued over the planning and implementation horizon. Overdraft during a period of drought is not sufficient to establish a chronic lowering of groundwater levels if extractions and recharge are managed as necessary to ensure that reductions in groundwater levels or storage during a period of drought are offset by increases in groundwater levels or storage during other periods.

(2) Significant and unreasonable reduction of groundwater storage.

(3) Significant and unreasonable seawater intrusion.

(4) Significant and unreasonable degraded water quality, including the migration of contaminant plumes that impair water supplies.

(5) Significant and unreasonable land subsidence that substantially interferes with surface land uses.

(6) Depletions of interconnected surface water that have significant and unreasonable adverse impacts on beneficial uses of the surface water.

(x) “Water budget” means an accounting of the total groundwater and surface water entering and leaving a basin including the changes in the amount of water stored.

(y) “Watermaster” means a watermaster appointed by a court or pursuant to other law.

(z) “Water year” means the period from October 1 through the following September 30, inclusive.

(aa) “Wellhead protection area” means the surface and subsurface area surrounding a water well or well field that supplies a public water system through which contaminants are reasonably likely to migrate toward the water well or well field.

SEC. 12.

Section 10726.4 of the Water Code, as added by Senate Bill 1168 of the 2013–14 Regular Session, is amended to read:

10726.4.

(a) A groundwater sustainability agency shall have the following additional authority and may regulate groundwater extraction using that authority:

(1) To impose spacing requirements on new groundwater well construction to minimize well interference and impose reasonable operating regulations on existing groundwater wells to minimize well interference, including requiring extractors to operate on a rotation basis.

(2) To control groundwater extractions by regulating, limiting, or suspending extractions from individual groundwater wells or extractions from groundwater wells in the aggregate, construction of new groundwater wells, enlargement of existing groundwater wells, or reactivation of abandoned groundwater wells, or otherwise establishing groundwater extraction allocations. Those actions shall be consistent with the applicable elements of the city or county general plan, unless there is insufficient sustainable yield in the basin to serve a land use designated in the city or county general plan. A limitation on extractions by a groundwater sustainability agency shall not be construed to be a final determination of rights to extract groundwater from the basin or any portion of the basin.

(3) To authorize temporary and permanent transfers of groundwater extraction allocations within the agency’s boundaries, if the total quantity of groundwater extracted in any water year is consistent with the provisions of the groundwater sustainability plan. The transfer is subject to applicable city and county ordinances.

(4) To establish accounting rules to allow unused groundwater extraction allocations issued by the agency to be carried over from one year to another and voluntarily transferred, if the total quantity of groundwater extracted in any five-year period is consistent with the provisions of the groundwater sustainability plan.

(b) This section does not authorize a groundwater sustainability agency to issue permits for the construction, modification, or abandonment of groundwater wells, except as authorized by a county with authority to issue those permits. A groundwater sustainability agency may request of the county, and the county shall consider, that the county forward permit requests for the construction of new groundwater wells, the enlarging of existing groundwater wells, and the reactivation of abandoned groundwater wells to the groundwater sustainability agency before permit approval.

SEC. 13.

Section 10726.8 of the Water Code, as added by Senate Bill 1168 of the 2013–14 Regular Session, is amended to read:

10726.8.

(a) This part is in addition to, and not a limitation on, the authority granted to a local agency under any other law. The local agency may use the local agency’s authority under any other law to apply and enforce any requirements of this part, including, but not limited to, the collection of fees.

(b) Nothing in this part shall be construed as authorizing a local agency to make a binding determination of the water rights of any person or entity.

(c) Nothing in this part is a limitation on the authority of the board, the department, or the State Department of Public Health.

(d) Notwithstanding Section 6103 of the Government Code, a state or local agency that extracts groundwater shall be subject to a fee imposed under this part to the same extent as any nongovernmental entity.

(e) Except as provided in subdivision (d), this part does not authorize a local agency to impose any requirement on the state or any agency, department, or officer of the state. State agencies and departments shall work cooperatively with a local agency on a voluntary basis.

(f) Nothing in this chapter or a groundwater sustainability plan shall be interpreted as superseding the land use authority of cities and counties, including the city or county general plan, within the overlying basin.

SEC. 14.

Section 10726.9 is added to the Water Code, to read:

10726.9.

A groundwater sustainability plan shall take into account the most recent planning assumptions stated in local general plans of jurisdictions overlying the basin.

SEC. 15.

Chapter 7 (commencing with Section 10729) is added to Part 2.74 of Division 6 of the Water Code, to read:

CHAPTER 7. Technical Assistance

10729.

(a) The department or a groundwater sustainability agency may provide technical assistance to entities that extract or use groundwater to promote water conservation and protect groundwater resources.

(b) The department may provide technical assistance to any groundwater sustainability agency in response to that agency's request for assistance in the development and implementation of a groundwater sustainability plan. The department shall use its best efforts to provide the requested assistance.

(c) The department shall prepare and publish a report by December 31, 2016, on its Internet Web site that presents the department's best estimate, based on available information, of water available for replenishment of groundwater in the state.

(d) (1) By January 1, 2017, the department shall publish on its Internet Web site best management practices for the sustainable management of groundwater.

(2) The department shall develop the best management practices through a public process involving one public meeting conducted at a location in northern California, one public meeting conducted at a location in the San Joaquin Valley, one public meeting conducted at a location in southern California, and one public meeting of the California Water Commission.

SEC. 16.

Chapter 8 (commencing with Section 10730) is added to Part 2.74 of Division 6 of the Water Code, to read:

CHAPTER 8. Financial Authority

10730.

(a) A groundwater sustainability agency may impose fees, including, but not limited to, permit fees and fees on groundwater extraction or other regulated activity, to fund the costs of a groundwater sustainability program, including, but not limited to, preparation, adoption, and amendment of a groundwater sustainability plan, and investigations, inspections, compliance assistance, enforcement, and program administration, including a prudent reserve. A groundwater sustainability agency shall not impose a fee pursuant to this subdivision on a de minimis extractor unless the agency has regulated the users pursuant to this part.

(b) (1) Prior to imposing or increasing a fee, a groundwater sustainability agency shall hold at least one public meeting, at which oral or written presentations may be made as part of the meeting.

(2) Notice of the time and place of the meeting shall include a general explanation of the matter to be considered and a statement that the data required by this section is available. The notice shall be provided by publication pursuant to Section 6066 of the Government Code, by posting notice on the Internet Web site of the groundwater sustainability agency, and by mail to any interested party who files a written request with the agency for mailed notice of the meeting on new or increased fees. A written request for mailed notices shall be valid for one year from the date that the request is made and may be renewed by making a written request on or before April 1 of each year.

(3) At least 10 days prior to the meeting, the groundwater sustainability agency shall make available to the public data upon which the proposed fee is based.

(c) Any action by a groundwater sustainability agency to impose or increase a fee shall be taken only by ordinance or resolution.

(d) (1) As an alternative method for the collection of fees imposed pursuant to this section, a groundwater sustainability agency may adopt a resolution requesting collection of the fees in the same manner as ordinary municipal ad valorem taxes.

(2) A resolution described in paragraph (1) shall be adopted and furnished to the county auditor-controller and board of supervisors on or before August 1 of each year that the alternative collection of the fees is being requested. The resolution shall include a list of parcels and the amount to be collected for each parcel.

(e) The power granted by this section is in addition to any powers a groundwater sustainability agency has under any other law.

10730.2.

(a) A groundwater sustainability agency that adopts a groundwater sustainability plan pursuant to this part may impose fees on the extraction of groundwater from the basin to fund costs of groundwater management, including, but not limited to, the costs of the following:

(1) Administration, operation, and maintenance, including a prudent reserve.

(2) Acquisition of lands or other property, facilities, and services.

(3) Supply, production, treatment, or distribution of water.

(4) Other activities necessary or convenient to implement the plan.

(b) Until a groundwater sustainability plan is adopted pursuant to this part, a local agency may impose fees in accordance with the procedures provided in this section for the purposes of Part 2.75 (commencing with Section 10750) as long as a groundwater management plan adopted before January 1, 2015, is in effect for the basin.

(c) Fees imposed pursuant to this section shall be adopted in accordance with subdivisions (a) and (b) of Section 6 of Article XIII D of the California Constitution.

(d) Fees imposed pursuant to this section may include fixed fees and fees charged on a volumetric basis, including, but not limited to, fees that increase based on the quantity of groundwater produced annually, the year in which the production of groundwater commenced from a groundwater extraction facility, and impacts to the basin.

(e) The power granted by this section is in addition to any powers a groundwater sustainability agency has under any other law.

10730.4.

A groundwater sustainability agency may fund activities pursuant to Part 2.75 (commencing with Section 10750) and may impose fees pursuant to Section 10730.2 to fund activities undertaken by the agency pursuant to Part 2.75 (commencing with Section 10750).

10730.6.

(a) A groundwater fee levied pursuant to this chapter shall be due and payable to the groundwater sustainability agency by each owner or operator on a day established by the groundwater sustainability agency.

(b) If an owner or operator knowingly fails to pay a groundwater fee within 30 days of it becoming due, the owner or operator shall be liable to the groundwater sustainability agency for interest at the rate of 1 percent per month on the delinquent amount of the groundwater fee and a 10-percent penalty.

(c) The groundwater sustainability agency may bring a suit in the court having jurisdiction against any owner or operator of a groundwater extraction facility within the area covered by the plan for the collection of any delinquent groundwater fees, interest, or penalties imposed under this chapter. If the groundwater sustainability agency seeks an attachment against the property of any named defendant in the suit, the groundwater sustainability agency shall not be required to furnish a bond or other undertaking as provided in Title 6.5 (commencing with Section 481.010) of Part 2 of the Code of Civil Procedure.

(d) In the alternative to bringing a suit pursuant to subdivision (c), a groundwater sustainability agency may collect any delinquent groundwater charge and any civil penalties and interest on the delinquent groundwater charge pursuant to the laws applicable to the local agency or, if a joint powers authority, to the entity designated pursuant to Section 6509 of the Government Code. The collection shall be in the same manner as it would be applicable to the collection of delinquent assessments, water charges, or tolls.

(e) As an additional remedy, a groundwater sustainability agency, after a public hearing, may order an owner or operator to cease extraction of groundwater until all delinquent fees are paid. The groundwater sustainability agency shall give notice to the owner or operator by certified mail not less than 15 days in advance of the public hearing.

(f) The remedies specified in this section for collecting and enforcing fees are cumulative and may be pursued alternatively or may be used consecutively as determined by the governing body.

10730.8.

(a) Nothing in this chapter shall affect or interfere with the authority of a groundwater sustainability agency to levy and collect taxes, assessments, charges, and tolls as otherwise provided by law.

(b) Personal information included in a report or record pursuant to this chapter has the same protection from disclosure as is provided for information concerning utility customers of local agencies pursuant to Section 6254.16 of the Government Code.

10731.

(a) Following an investigation pursuant to Section 10725.4, the governing body may make a determination fixing the amount of groundwater production from the groundwater extraction facility at an amount not to exceed the maximum production capacity of the facility for purposes of levying a groundwater charge. If a water-measuring device is permanently attached to the groundwater extraction facility, the record of production as disclosed by the water-measuring device shall be presumed to be accurate unless the contrary is established by the groundwater sustainability agency after investigation.

(b) After the governing body makes a determination fixing the amount of groundwater production pursuant to subdivision (a), a written notice of the determination shall be mailed to the owner or operator of the groundwater extraction facility at the address as shown by the groundwater sustainability agency's records. A determination made by the governing body shall be conclusive on the owner or operator and the groundwater charges, based on the determination together with any interest and penalties, shall be payable immediately unless within 20 days after the mailing of the notice the owner or operator files with the governing body a written protest setting forth the ground for protesting the amount of production or the groundwater charges, interest, and penalties. If a protest is filed pursuant to this subdivision, the governing body shall hold a hearing to determine the total amount of the groundwater production and the groundwater charges, interest, and penalties. Notice of the hearing shall be mailed to each protestant at least 20 days before the date fixed for the hearing. Notice of the determination of the governing body hearing shall be mailed to each protestant. The owner or operator shall have 20 days from the date of mailing of the determination to pay the groundwater charges, interest, and penalties determined by the governing body.

SEC. 17.

Chapter 9 (commencing with Section 10732) is added to Part 2.74 of Division 6 of the Water Code, to read:

CHAPTER 9. Groundwater Sustainability Agency Enforcement Powers

10732.

(a) (1) A person who extracts groundwater in excess of the amount that person is authorized to extract under a rule, regulation, ordinance, or resolution adopted pursuant to Section 10725.2, shall be subject to a civil penalty not to exceed five hundred dollars ($500) per acre-foot extracted in excess of the amount that person is authorized to extract. Liability under this subdivision is in addition to any liability imposed under paragraph (2) and any fee imposed for the extraction.

(2) A person who violates any rule, regulation, ordinance, or resolution adopted pursuant to Section 10725.2 shall be liable for a civil penalty not to exceed one thousand dollars ($1,000) plus one hundred dollars ($100) for each additional day on which the violation continues if the person fails to comply within 30 days after the local agency has notified the person of the violation.

(b) (1) A groundwater sustainability agency may bring an action in the superior court to determine whether a violation occurred and to impose a civil penalty described in subdivision (a).

(2) A groundwater sustainability agency may administratively impose a civil penalty described in subdivision (a) after providing notice and an opportunity for a hearing.

(3) In determining the amount of the penalty, the superior court or the groundwater sustainability agency shall take into consideration all relevant circumstances, including, but not limited to, the nature and persistence of the violation, the extent of the harm caused by the violation, the length of time over which the violation occurs, and any corrective action taken by the violator.

(c) A penalty imposed pursuant to this section shall be paid to the groundwater sustainability agency and shall be expended solely for purposes of this part.

(d) Penalties imposed pursuant to this section are in addition to any civil penalty or criminal fine under any other law.

SEC. 18.

Chapter 10 (commencing with Section 10733) is added to Part 2.74 of Division 6 of the Water Code, to read:

CHAPTER 10. State Evaluation and Assessment

10733.

(a) The department shall periodically review the groundwater sustainability plans developed by groundwater sustainability agencies pursuant to this part to evaluate whether a plan conforms with Sections 10727.2 and 10727.4 and is likely to achieve the sustainability goal for the basin covered by the groundwater sustainability plan.

(b) If a groundwater sustainability agency develops multiple groundwater sustainability plans for a basin, the department shall evaluate whether the plans conform with Sections 10727.2, 10727.4, and 10727.6 and are together likely to achieve the sustainability goal for the basin covered by the groundwater sustainability plans.

(c) The department shall evaluate whether a groundwater sustainability plan adversely affects the ability of an adjacent basin to implement their groundwater sustainability plan or impedes achievement of sustainability goals in an adjacent basin.

10733.2.

(a) (1) By June 1, 2016, the department shall adopt regulations for evaluating groundwater sustainability plans, the implementation of groundwater sustainability plans, and coordination agreements pursuant to this chapter.

(2) The regulations shall identify the necessary plan components specified in Sections 10727.2, 10727.4, and 10727.6 and other information that will assist local agencies in developing and implementing groundwater sustainability plans and coordination agreements.

(b) (1) The department may update the regulations, including to incorporate the best management practices identified pursuant to Section 10729.

(2) The regulations adopted pursuant to paragraph (1) of subdivision (a) shall identify appropriate methodologies and assumptions for baseline conditions concerning hydrology, water demand, regulatory restrictions that affect the availability of surface water, and unreliability of, or reductions in, surface water deliveries to the agency or water users in the basin, and the impact of those conditions on achieving sustainability. The baseline for measuring unreliability and reductions shall include the historic average reliability and deliveries of surface water to the agency or water users in the basin.

(c) By June 1, 2016, the department shall adopt regulations for evaluating alternatives submitted pursuant to Section 10733.6.

(d) The department shall adopt the regulations, including any amendments thereto, authorized by this section as emergency regulations in accordance with the Administrative Procedure Act (Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 3 of Title 2 of the Government Code). The adoption of these regulations is an emergency and shall be considered by the Office of Administrative Law as necessary for the immediate preservation of the public peace, health and safety, or general welfare. Notwithstanding the Administrative Procedure Act, emergency regulations adopted by the department pursuant to this section shall not be subject to review by the Office of Administrative Law and shall remain in effect until revised by the department.

(e) Before adopting and finalizing the regulations, the department shall conduct three public meetings to consider public comments. The department shall publish the draft regulations on its Internet Web site at least 30 days before the public meetings. One meeting shall be conducted at a location in northern California, one meeting shall be conducted at a location in the central valley of California, and one meeting shall be conducted at a location in southern California.

10733.3.

The department shall post all notices it receives pursuant to Section 10723 or 10723.8 on its Internet Web site within 15 days of receipt.

10733.4.

(a) Upon adoption of a groundwater sustainability plan, a groundwater sustainability agency shall submit the groundwater sustainability plan to the department for review pursuant to this chapter.

(b) If groundwater sustainability agencies develop multiple groundwater sustainability plans for a basin, the submission required by subdivision (a) shall not occur until the entire basin is covered by groundwater sustainability plans. When the entire basin is covered by groundwater sustainability plans, the groundwater sustainability agencies shall jointly submit to the department all of the following:

(1) The groundwater sustainability plans.

(2) An explanation of how the groundwater sustainability plans implemented together satisfy Sections 10727.2, 10727.4, and 10727.6 for the entire basin.

(3) A copy of the coordination agreement between the groundwater sustainability agencies to ensure the coordinated implementation of the groundwater sustainability plans for the entire basin.

(c) Upon receipt of a groundwater sustainability plan, the department shall post the plan on the department’s Internet Web site and provide 60 days for persons to submit comments to the department about the plan.

(d) The department shall evaluate the groundwater sustainability plan within two years of its submission by a groundwater sustainability agency and issue an assessment of the plan. The assessment may include recommended corrective actions to address any deficiencies identified by the department.

10733.6.
(a) If a local agency believes that an alternative described in subdivision (b) satisfies the objectives of this part, the local agency may submit the alternative to the department for evaluation and assessment of whether the alternative satisfies the objectives of this part for the basin.

(b) An alternative is any of the following:

(1) A plan developed pursuant to Part 2.75 (commencing with Section 10750) or other law authorizing groundwater management.

(2) Management pursuant to an adjudication action.

(3) An analysis of basin conditions that demonstrates that the basin has operated within its sustainable yield over a period of at least 10 years. The submission of an alternative described by this paragraph shall include a report prepared by a registered professional engineer or geologist who is licensed by the state and submitted under that engineer's or geologist's seal.

(c) A local agency shall submit an alternative pursuant to this section no later than January 1, 2017, and every five years thereafter.

(d) The assessment required by subdivision (a) shall include an assessment of whether the alternative is within a basin that is in compliance with Part 2.11 (commencing with Section 10920). If the alternative is within a basin that is not in compliance with Part 2.11 (commencing with Section 10920), the department shall find the alternative does not satisfy the objectives of this part.

10733.8.
At least every five years after initial submission of a plan pursuant to Section 10733.4, the department shall review any available groundwater sustainability plan or alternative submitted in accordance with Section 10733.6, and the implementation of the corresponding groundwater sustainability program for consistency with this part, including achieving the sustainability goal. The department shall issue an assessment for each basin for which a plan or alternative has been submitted in accordance with this chapter, with an emphasis on assessing progress in achieving the sustainability goal within the basin. The assessment may include recommended corrective actions to address any deficiencies identified by the department.

SEC. 19.
Chapter 11 (commencing with Section 10735) is added to Part 2.74 of Division 6 of the Water Code, to read:

CHAPTER 11. State Intervention
10735.
As used in this chapter, the following terms have the following meanings:

(a) "Condition of long-term overdraft" means the condition of a groundwater basin where the average annual amount of water extracted for a long-term period, generally 10 years or more, exceeds the long-term average annual supply of water to the basin, plus any temporary surplus. Overdraft during a period of drought is not sufficient to establish a condition of long-term overdraft if extractions and recharge are managed as necessary to ensure that reductions in groundwater levels or storage during a period of drought are offset by increases in groundwater levels or storage during other periods.

(b) "Person" means any person, firm, association, organization, partnership, business, trust, corporation, limited liability company, or public agency, including any city, county, city and county, district, joint powers authority, state, or any agency or department of those entities. "Person" includes, to the extent authorized by federal or tribal law and subject to the limitations described in subdivisions (c) and (d) of Section 10720.3, the United States, a department, agency or instrumentality of the federal government, an Indian tribe, an authorized Indian tribal organization, or interstate body.

(c) "Probationary basin" means a basin for which the board has issued a determination under Section 10735.2.

(d) "Significant depletions of interconnected surface waters" means reductions in flow or levels of surface water that is hydrologically connected to the basin such that the reduced surface water flow or levels have a significant and unreasonable adverse impact on beneficial uses of the surface water.

10735.2.
(a) The board, after notice and a public hearing, may designate a basin as a probationary basin, if the board finds one or more of the following applies to the basin:

(1) After June 30, 2017, none of the following have occurred:

(A) A local agency has elected to be a groundwater sustainability agency that intends to develop a groundwater sustainability plan for the entire basin.

(B) A collection of local agencies has formed a groundwater sustainability agency or prepared agreements to develop one or more groundwater sustainability plans that will collectively serve as a groundwater sustainability plan for the entire basin.

(C) A local agency has submitted an alternative that has been approved or is pending approval pursuant to Section 10733.6. If the department disapproves an alternative pursuant to Section 10733.6, the board shall not act under this paragraph until at least 180 days after the department disapproved the alternative.

(2) The basin is subject to paragraph (1) of subdivision (a) of Section 10720.7, and after January 31, 2020, none of the following have occurred:

(A) A groundwater sustainability agency has adopted a groundwater sustainability plan for the entire basin.

(B) A collection of local agencies has adopted groundwater sustainability plans that collectively serve as a groundwater sustainability plan for the entire basin.

(C) The department has approved an alternative pursuant to Section 10733.6.

(3) After January 31, 2020, the department, in consultation with the board, determines that a groundwater sustainability plan is inadequate or that the groundwater sustainability program is not being implemented in a manner that will likely achieve the sustainability goal.

(4) The basin is subject to paragraph (2) of subdivision (a) of Section 10720.7, and after January 31, 2022, none of the following have occurred:

(A) A groundwater sustainability agency has adopted a groundwater sustainability plan for the entire basin.

(B) A collection of local agencies has adopted groundwater sustainability plans that collectively serve as a groundwater sustainability plan for the entire basin.

(C) The department has approved an alternative pursuant to Section 10733.6.

(5) The basin is subject to paragraph (2) of subdivision (a) of Section 10720.7, and after January 31, 2022, both of the following have occurred:

(A) The department, in consultation with the board, determines that a groundwater sustainability plan is inadequate or that the groundwater sustainability plan is not being implemented in a manner that will likely achieve the sustainability goal.

(B) The board determines that the basin is in a condition of long-term overdraft or in a condition where groundwater extractions result in significant depletions of interconnected surface waters.

(b) In making the findings associated with paragraph (3) or (5) of subdivision (a), the department and board may rely on periodic assessments the department has prepared pursuant to Chapter 10 (commencing with Section 10733). The board may request that the department conduct additional assessments utilizing the regulations developed pursuant to Chapter 10 (commencing with Section 10733) and make determinations pursuant to this section. The board shall post on its Internet Web site and provide at least 30 days for the public to comment on any determinations provided by the department pursuant to this subdivision.

(c) (1) The determination may exclude a class or category of extractions from the requirement for reporting pursuant to Part 5.2 (commencing with Section 5200) of Division 2 if those extractions are subject to a local plan or program that adequately manages groundwater within the portion of the basin to which that plan or program applies, or if those extractions are likely to have a minimal impact on basin withdrawals.

(2) The determination may require reporting of a class or category of extractions that would otherwise be exempt from reporting pursuant to paragraph (1) of subdivision (c) of Section 5202 if those extractions are likely to have a substantial impact on basin withdrawals or requiring reporting of those extractions is reasonably necessary to obtain information for purposes of this chapter.

(3) The determination may establish requirements for information required to be included in reports of groundwater extraction, for installation of measuring devices, or for use of a methodology, measuring device, or both, pursuant to Part 5.2 (commencing with Section 5200) of Division 2.

(4) The determination may modify the water year or reporting date for a report of groundwater extraction pursuant to Section 5202.

(d) If the board finds that litigation challenging the formation of a groundwater sustainability agency prevented its formation before July 1, 2017, pursuant to paragraph (1) of subdivision (a) or prevented a groundwater sustainability program from being implemented in a manner likely to achieve the sustainability goal pursuant to paragraph (3) of subdivision (a), the board shall not designate a basin as a probationary basin for a period of time equal to the delay caused by the litigation.

10735.4.

(a) If the board designates a basin as a probationary basin pursuant to paragraph (1) or (2) of subdivision (a) of Section 10735.2, a local agency or groundwater sustainability agency shall have 180 days to remedy the deficiency. The board may appoint a mediator or other facilitator, after consultation with affected local agencies, to assist in resolving disputes, and identifying and implementing actions that will remedy the deficiency.

(b) After the 180-day period provided by subdivision (a), the board may provide additional time to remedy the deficiency if it finds that a local agency is making substantial progress toward remedying the deficiency.

(c) The board may develop an interim plan pursuant to Section 10735.8 for the probationary basin at the end of the period provided by subdivision (a) or any extension provided pursuant to subdivision (b), if the board, in consultation with the department, determines that a local agency has not remedied the deficiency that resulted in designating the basin as a probationary basin.

10735.6.

(a) If the board designates a basin as a probationary basin pursuant to paragraph (3) of subdivision (a) of Section 10735.2, the board shall identify the specific deficiencies and identify potential actions to address the deficiencies. The board may request the department to provide local agencies, within 90 days of the designation of a probationary basin, with technical recommendations to remedy the deficiencies.

(b) The board may develop an interim plan pursuant to Section 10735.8 for the probationary basin one year after the designation of the basin pursuant to paragraph (3) of subdivision (a) of Section 10735.2, if the board, in consultation with the department, determines that a local agency has not remedied the deficiency that resulted in designating the basin a probationary basin.

10735.8.

(a) The board, after notice and a public hearing, may adopt an interim plan for a probationary basin.

(b) The interim plan shall include all of the following:

(1) Identification of the actions that are necessary to correct a condition of long-term overdraft or a condition where groundwater extractions result in significant depletions of interconnected surface waters, including recommendations for appropriate action by any person.

(2) A time schedule for the actions to be taken.

(3) A description of the monitoring to be undertaken to determine effectiveness of the plan.

(c) The interim plan may include the following:

(1) Restrictions on groundwater extraction.

(2) A physical solution.

(3) Principles and guidelines for the administration of rights to surface waters that are connected to the basin.

(d) Except as provided in subdivision (e), the interim plan shall be consistent with water right priorities, subject to Section 2 of Article X of the California Constitution.

(e) Where, in the judgment of the board, a groundwater sustainability plan, groundwater sustainability program, or an adjudication action can be relied on as part of the interim plan, either throughout the basin or in an area within the basin, the board may rely on, or incorporate elements of, that plan, program, or adjudication into the interim plan adopted by the board or allow local agencies to continue implementing those parts of a plan or program that the board determines are adequate.

(f) In carrying out activities that may affect the probationary basin, state entities shall comply with an interim plan adopted by the board pursuant to this section unless otherwise directed or authorized by statute and the state entity shall indicate to the board in writing the authority for not complying with the interim plan.

(g) (1) After the board adopts an interim plan under this section, the board shall determine if a groundwater sustainability plan or an adjudication action is adequate to eliminate the condition of long-term overdraft or condition where groundwater extractions result in significant depletions of interconnected surface waters, upon petition of either of the following:

(A) A groundwater sustainability agency that has adopted a groundwater sustainability plan for the probationary basin or a portion thereof.

(B) A person authorized to file the petition by a judicial order or decree entered in an adjudication action in the probationary basin.

(2) The board shall act on a petition filed pursuant to paragraph (1) within 90 days after the petition is complete. If the board, in consultation with the department, determines that the groundwater sustainability plan or adjudication action is adequate, the board shall rescind the interim plan adopted by the board for the probationary basin, except as provided in paragraphs (3) and (4).

(3) Upon request of the petitioner, the board may amend an interim plan adopted under this section to eliminate portions of the interim plan, while allowing other portions of the interim plan to continue in effect.

(4) The board may decline to rescind an interim plan adopted pursuant to this section if the board determines that the petitioner has not provided adequate assurances that the groundwater sustainability plan or judicial order or decree will be implemented.

(5) This subdivision is not a limitation on the authority of the board to stay its proceedings under this section or to rescind or amend an interim plan adopted pursuant to this section based on the progress made by a groundwater sustainability agency or in an adjudication action, even if the board cannot make a determination of adequacy in accordance with paragraph (1).

(h) The board’s authority to adopt an interim plan under this section does not alter the law establishing water rights priorities or any other authority of the board.

10736.

(a) The board shall adopt or amend a determination or interim plan under Section 10735.2 or 10735.8 in accordance with procedures for quasi-legislative action.

(b) The board shall provide notice of a hearing described in subdivision (a) of Section 10735.2 or subdivision (a) of Section 10735.8 as follows:

(1) At least 90 days before the hearing, the board shall publish notice of the hearing on its Internet Web site.

(2) At least 90 days before the hearing, the board shall notify the department and each city, county, or city and county in which any part of the basin is situated.

(3) (A) For the purposes of this paragraph, the terms “board-designated local area” and “local agency” have the same meaning as defined in Section 5009.

(B) At least 60 days before the hearing, the board shall mail or send by electronic mail notice to all persons known to the board who extract or who propose to extract water from the basin, or who have made written or electronic mail requests to the board for special notice of hearing pursuant to this part. If any portion of the basin is within a board-designated local area, the records made available to the board by the local agency in accordance with paragraph (4) of subdivision (d) of Section 5009 shall include the names and addresses of persons and entities known to the local agency who extract water from the basin, and the board shall mail or send by electronic mail notice to those persons.

(c) The board shall provide notice of proceedings to amend or repeal a determination or plan under Section 10735.2 or 10735.8 as appropriate to the proceedings, taking into account the nature of the proposed revision and the person likely to be affected.

(d) (1) Except as provided in paragraphs (2) and (3), Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 2 of Title 2 of the Government Code does not apply to any action authorized pursuant to Section 10735.2 or 10735.8.

(2) The board may adopt a regulation in accordance with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 2 of Title 2 of the Government Code setting procedures for adopting a determination or plan.

(3) The board may adopt a regulation applying or interpreting this part pursuant to Section 1530 if the board determines that the emergency regulation is reasonably necessary for the allocation, administration, or collection of fees authorized pursuant to Section 1529.5.

10736.2.

Division 13 (commencing with Section 21000) of the Public Resources Code does not apply to any action or failure to act by the board under this chapter, other than the adoption or amendment of an interim plan pursuant to Section 10735.8.

10736.4.

The extraction or use of water extracted in violation of an interim plan under this part shall not be relied upon as a basis for establishing the extraction or use of water to support a claim in an action or proceeding for determination of water rights.

10736.6.

(a) The board may order a person that extracts or uses water from a basin that is subject to an investigation or proceeding under this chapter to prepare and submit to the board any technical or monitoring program reports related to that person's or entity's extraction or use of water as the board may specify. The costs incurred by the person in the preparation of those reports shall bear a reasonable relationship to the need for the report and the benefit to be obtained from the report. If the preparation of individual reports would result in a duplication of effort, or if the reports are necessary to evaluate the cumulative effect of several diversions or uses of water, the board may order any person subject to this subdivision to pay a reasonable share of the cost of preparing reports.

(b) (1) An order issued pursuant to this section shall be served by personal service or registered mail on the party to submit technical or monitoring program reports or to pay a share of the costs of preparing reports. Unless the board issues the order after a hearing, the order shall inform the party of the right to request a hearing within 30 days after the party has been served. If the party does not request a hearing within that 30-day period, the order shall take effect as issued. If the party requests a hearing within that 30-day period, the board may adopt a decision and order after conducting a hearing.

(2) In lieu of adopting an order directed at named persons in accordance with the procedures specified in paragraph (1), the board may adopt a regulation applicable to a category or class of persons in accordance with Chapter 3.5 (commencing with Section 11340) of Part 1 of Division 2 of Title 2 of the Government Code.

(c) Upon application of a person or upon its own motion, the board may review and revise an order issued or regulation adopted pursuant to this section in accordance with the procedures set forth in subdivision (b).

(d) In conducting an investigation or proceeding pursuant to this part, the board may inspect the property or facilities of a person to ascertain whether the purposes of this part are being met and to ascertain compliance with this part. The board may obtain an inspection warrant pursuant to the procedures set forth in Title 13 (commencing with Section 1822.50) of Part 3 of the Code of Civil Procedure for the purposes of an inspection pursuant to this subdivision.

SEC. 20.

The provisions of this act are severable. If any provision of this act or its application is held invalid, that invalidity shall not affect other provisions or applications that can be given effect without the invalid provision or application.

SEC. 21.

No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution for certain costs that may be incurred by a local agency or school district because, in that regard, this act creates a new crime or infraction, eliminates a crime or infraction, or changes the penalty for a crime or infraction, within the meaning of Section 17556 of the Government Code, or changes the definition of a crime within the meaning of Section 6 of Article XIII B of the California Constitution.

However, if the Commission on State Mandates determines that this act contains other costs mandated by the state, reimbursement to local agencies and school districts for those costs shall be made pursuant to Part 7 (commencing with Section 17500) of Division 4 of Title 2 of the Government Code.

SEC. 22.

The Legislature finds and declares that Section 10 of this act, which adds Section 5206 to the Water Code and Section 16 of this act, which adds Section 10730.8 to the Water Code, impose a limitation on the public's right of access to the meetings of public bodies or the writings of public officials and agencies within the meaning of Section 3 of Article I of the California Constitution. Pursuant to that constitutional provision, the Legislature makes the following findings to demonstrate the interest protected by this limitation and the need for protecting that interest:

In order to allow this act to fully accomplish its goals, it is necessary to protect proprietary information submitted pursuant to this act as confidential. Therefore, it is in the state’s interest to limit public access to this information.

SEC. 23.

This act shall only become operative if Senate Bill 1168 of the 2013–14 Regular Session is enacted and becomes effective.

1992 Assembly Bill 3030 (AB3030)

With AB 3030 in 1992, sections 10750-10756 of the California Water Code (AB 3030) provided a systematic procedure for an existing local agency to develop a groundwater management plan. This section of the code provides such an agency with the powers of a water replenishment district to raise revenue to pay for facilities to manage the basin (extraction, recharge, conveyance, quality).

Groundwater Management entrance in CA Water Code

AB 3030 (California Water Code Section 10750 et seq.) allowed certain defined existing local agencies to develop a groundwater management plan in groundwater basins defined in DWR Bulletin 118. No new level of government is formed. Action is voluntary not mandatory.

The plan can be developed only after a public hearing and adoption of a resolution of intention to adopt a groundwater management plan. If there is no majority opposition of assessed land value (no improvements), the plan can be adopted within 35 days. If the majority is opposed the plan cannot be adopted and no new plan may be attempted for 1 year. Once the plan is adopted, rules and regulations must be adopted to implement the program called for in the plan.

Given the involvement and jurisdiction of the courts, AB 3030 plans cannot be adopted in adjudicated basins or in basins where groundwater is managed under other sections of the Water Code without the permission of the court or the other agency.

AB 3030 also introduced twelve technical components that may be included in the groundwater management plan. It is highly encouraged by DWR to include as many of the twelve components as necessary for the successful management of the basin groundwater resources. The following is the list of the twelve voluntary components:

1. The control of saline water intrusion.
2. Identification and management of wellhead protection areas and recharge areas.
3. Regulation of the migration of contaminated groundwater.
4. The administration of a well abandonment and well destruction program.
5. Mitigation of conditions of overdraft.
6. Replenishment of groundwater extracted by water producers.
7. Monitoring of groundwater levels and storage.
8. Facilitating conjunctive use operations.
9. Identification of well construction policies.
10. The construction and operation by the local agency of groundwater contamination cleanup, recharge, storage, conservation, water recycling, and extraction projects.
11. The development of relationships with state and federal regulatory agencies.
12. The review of land use plans and coordination with land use planning agencies to assess activities which create a reasonable risk of groundwater contamination.

RE: Order Amending Waste Discharge Requirements Order R5-2008-0173 (NPDES Permit No. CA0078662) for El Dorado Irrigation District, Deer Creek Wastewater Treatment Plant, Eldorado County

Dear Mesdames Creedon, Messina and Messrs. Landau, Palmer,

The California Sportfishing Protection Alliance (CSPA) has reviewed the proposed Amended Waste Discharge Requirements (NPDES No. CA0078662) for the Deer Creek Wastewater Treatment Plant (Permit) and submits the following comments.

CSPA requests status as a designated party for this proceeding. CSPA is a 501(c)(3) public benefit conservation and research organization established in 1983 for the purpose of conserving, restoring, and enhancing the state's water quality and fishery resources and their aquatic ecosystems and associated riparian habitats. CSPA has actively promoted the protection of water quality and fisheries throughout California before state and federal agencies, the State Legislature and Congress and regularly participates in administrative and judicial proceedings on behalf of its members to protect, enhance, and restore California's degraded water quality and fisheries. CSPA members reside, boat, fish and recreate in and along waterways throughout the Central Valley, including El Dorado County.

1. **The proposed Permit establishes Effluent Limitations for metals based on the hardness of the effluent as opposed to the ambient instream receiving water hardness and fails to use the mandated equations as required by Federal Regulations, the California Toxics Rule (CTR, 40 CFR 131.38(c)(4)).**

Hardness
The Court's Ruling

The California Toxics Rule (CTR) Federal Regulation 40 CFR 131.38(c)(4) states that: "For purposes of calculating freshwater aquatic life criteria for metals from the equations in paragraph (b)(2) of this section, for waters with a hardness of 400 mg/l or less as calcium carbonate, <u>the actual ambient hardness of the surface water shall be used</u> in those equations." (Emphasis added).

As is stated in the proposed Permit, the permit is being amended based on a ruling of the Superior Court of California (Case number 34-2009-80000309) (County of Sacramento, Judge Timothy M. Frawley, 26 January 2011). With regard to the development of effluent limitations for hardness dependant metals and an objection by the Regional Board the court found that:

> *"Ruling. Respondent Board's objection is denied. The Court finds no ambiguity in the footnote. If the Board calculates the fresh aquatic life criteria for hardness-dependent metals based on the hardness value of the downstream receiving water, it must use the actual ambient hardness of the surface water after the effluent and receiving water have fully mixed It cannot use the hardness values of the receiving water "at or immediately downstream of the discharge outfall," since this is (for all intents and purposes) the same as <u>using the hardness values of the effluent, which is prohibited</u>."*

With regard to hardness dependant metals the Court ruling, in part, also contains the following:

> *On balance, the Court is persuaded that the term "ambient," as applied in the CTR, refers to the surface water surrounding the aquatic life. In light of the purpose of the CTR, it would be unreasonable to interpret the regulation as requiring States to ignore the effect of the effluent on the hardness (and consequent toxicity) of the downstream receiving water. The most reasonable interpretation of the regulation, therefore, is that the metal criteria should be calculated based on the actual ambient hardness of the surface water after the effluent and receiving water mix.[7] Stated differently, the criteria should be based on the upstream receiving water hardness, adjusted, as necessary, for the effects of the effluent. (Footnote No. 7 on page 14 of the final court order states that: "This means after the effluent and receiving water fully mix")*
>
> *For the determination of the CTR hardness-dependent metals criteria, the Board has the discretion to use either the upstream receiving water hardness values or the hardness values of the downstream mixture of the effluent and the receiving water, whichever is most protective.*

The final court ruling is quite clear that when developing effluent limitations for hardness dependant metals that:

(1) The hardness of the surface water must be used;

(2) Use of the effluent hardness is prohibited; and
(3) The term ambient means that the hardness must be taken from outside the area where the effluent mixes with the receiving stream.
(4) Either the upstream surface water hardness or the downstream surface water hardness (following complete mixing with the effluent) may be used to develop effluent limitations for hardness dependant metals, whichever is most protective.

The Effluent Hardness Was Used in the Revised Permit

The proposed Permit, page F-23, states that:

> *"For both copper and zinc, using the "fully mixed" hardness value results in criteria that are higher (less stringent) than using the effluent-dominated (100% effluent) condition in the receiving water. Effluent limitations based on the less stringent criteria would allow the effluent to cause receiving water toxicity during low-flow conditions. Even assuming that would be a correct interpretation of the CTR and SIP or the EID Court Order, a more stringent effluent limitation would required to comply with the Basin Plan's narrative toxicity objective unless the Board approves a mixing zone.14 Accordingly, this Order sets effluent limitations for copper and zinc based on low-flow conditions as shown in the above tables."* (Emphasis added)

The "above tables" referred to in the permit are Tables F-4 and F-5 on pages F-21 and F-22. The "low flow conditions" described in the text can be observed in Tables F-4 and F-5 in the far left hand lower column of the tables. The "low flow condition" in the tables represents "100% effluent" with a recorded effluent hardness value of 42 mg/l.

Throughout the text in the proposed Permit, pages F-16 through F-26, discussing the development of effluent limitations for hardness dependant metals, the discussion is limited to the effluent and upstream ambient hardness. The downstream surface water ambient hardness, as defined by the court; following complete mixing is not discussed or numerically cited. While the Regional Board attempts to calculate this value, we can only conclude based on the total absence of downstream surface water ambient hardness values that it has not been sampled by the Discharger.

On page F-20 of the proposed Permit, the discussion, equation 3 and the following Table F-4 are all based on the lowest observed effluent hardness of 42 mg/l. Again, based on the total absence of discussion of any downstream surface water sampling for hardness, the Regional Board's decision process is based on the effluent hardness, which was confirmed by the Superior Court is prohibited.

The proposed Permit discussion beginning on page F-23 again focuses on the effluent hardness. This can be observed by evaluation of equation 4 (page F-23) where the input value H_e represents the lowest observed effluent value. The data in Table F-5 are based on equation 4 and is therefore also based on the effluent hardness.

The development of effluent limitations for hardness dependant metals in the proposed Permit is based on the effluent hardness or a combination of the effluent and upstream hardnesses. The use of the effluent hardness rather than the CTR prescribed "actual ambient hardness of the surface water" is contrary to the requirements of the CTR and directly violates the mandate of the Superior Court's Order. As cited above the Superior Court clearly stated that use of the effluent hardness is prohibited.

The Wrong Equations Were Used

The California Toxics Rule (CTR) Federal Regulation 40 CFR 131.38(c)(4) states that: "For purposes of calculating freshwater aquatic life criteria for metals from <u>the equations in paragraph (b)(2) of this section</u>, for waters with a hardness of 400 mg/l or less as calcium carbonate, the actual ambient hardness of the surface water shall be used <u>in those equations</u>." (Emphasis added).

The CTR requires the use of the equations presented in paragraph (b)(2) of 40 CFR 131.38 for the development of effluent limitations for hardness dependant metals. The required CTR equation is:

CTR Criterion = WER x (exp(m[ln(H)]+b)

where: H = hardness (mg/L as $CaCO3$), WER = water-effect ratio (with a default value of 1) and m, b = metal and criterion specific constants.

The CTR equation is cited as "equation 1" in the proposed Permit (page F-18). The proposed Permit cites a 2006 technical paper prepared by Robert Emerick (see footnote 7 on page F-18) as the source of the equations used by the Regional Board in developing the Permit effluent limitations for some hardness dependant metals (see Table F-6 footnote 2). Dr. Emerick's equation 4 is presented on page F-23 of the proposed Permit. Equation 4 is not the same as equation 1 which is prescribed by the CTR.

The use of equations other than those prescribed by the CTR for development of effluent limitations for hardness dependant metals is contrary to the requirements of the CTR.

The "ambient" hardness was not used

Federal Regulation 40 CFR 131.38(c)(4) states that: "For purposes of calculating freshwater aquatic life criteria for metals from the equations in paragraph (b)(2) of this section, for waters with a hardness of 400 mg/l or less as calcium carbonate, <u>the actual ambient hardness</u> of the surface water shall be used in those equations." (Emphasis added).

The common dictionary definition of *ambient* is "in the surrounding area", "encompassing on all sides".

In petitioning the Deer Creek permit, CSPA argued that the common definition of ambient of surrounding would eliminate any areas that included the wastewater effluent in consideration of the hardness used in determining criteria for hardness dependant metals. It is reasonable to assume, after considering the definition of ambient, that EPA is referring to the hardness of the receiving stream before it is potentially impacted by an effluent discharge. It is also reasonable to make this assumption based on past interpretations and since EPA, in permit writers' guidance and other reference documents, generally assumes receiving streams have dilution, which would ultimately "encompass" the discharge. Ambient conditions are in-stream conditions unimpacted by the discharge. Confirming this definition, the SIP Sections 1.4.3.1 *Ambient Background Concentration as an Observed Maximum* and 1.4.3.2 state in part that: "If possible, preference should be given to <u>ambient water column concentrations measured immediately upstream or near the discharge, but not within an allowed mixing zone for the discharge</u>. The RWQCB shall have discretion to consider if any samples are invalid for use as applicable data due to evidence that the sample has been erroneously reported or the sample is not representative of the ambient receiving water column that will mix with the discharge."

CSPA's view regarding the term ambient is also supported by a biological opinion issued by the US Fish and Wildlife Service (Service) and the National Marine Fisheries Service (NMFS) on March 24th 2000. On March 24, 2000 the US Fish and Wildlife Service (Service) and the National Marine Fisheries Service (NMFS) issued a biological opinion on the effects of the final promulgation of the CTR on listed species and critical habitats in California in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 USC 1531 et seq.; Act). The biological opinion was issued to the U.S. Environmental Protection Agency, Region 9, with regard to the "Final Rule for the Promulgation of Water Quality Standards: Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California" (CTR)". The document represented the Services' final biological opinion on the effects of the final promulgation of the CTR on listed species and critical habitats in California in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 USC 1531 et seq.; Act). The biological opinion contains the following discussion, beginning on page 205, regarding the use of hardness in developing limitations for toxic metals:

> "The CTR should more clearly identify what is actually to be measured in a site water to determine a site-specific hardness value. Is the measure of hardness referred to in the CTR equations a measure of the water hardness due to calcium and magnesium ions only? If hardness computations were specified to be derived from data obtained in site water calcium and magnesium determinations alone, confusion could be avoided and more accurate results obtained (APHA 1985). Site hardness values would thus not include contributions from other multivalent cations (e.g., iron, aluminum, manganese), would not rise above calcium + magnesium hardness values, or result in greater-than-intended site criteria when used in formulas. In this Biological opinion, what the Services refer to as hardness is the water hardness due to calcium + magnesium ions only.

> The CTR should clearly state that to obtain a site hardness value, samples should be collected upstream of the effluent source(s). Clearly stating this requirement in the CTR would avoid the computation of greater-than-intended site criteria in cases where samples were collected downstream of effluents that raise ambient hardness, but not other important water qualities that affect metal toxicity (e.g., pH, alkalinity, dissolved organic carbon, calcium, sodium, chloride, etc.). Clearly, it is inappropriate to use downstream site water quality variables for input into criteria formulas because they may be greatly altered by the effluent under regulation. Alterations in receiving water chemistry by a discharger (e.g., abrupt elevation of hardness, changes in pH, exhaustion of alkalinity, abrupt increases in organic matter etc.) should not result, through application of hardness in criteria formulas, in increased allowable discharges of toxic metals. If the use of downstream site water quality variables were allowed, discharges that alter the existing, naturally-occurring water composition would be encouraged rather than discouraged. Discharges should not change water chemistry even if the alterations do not result in toxicity, because the aquatic communities present in a water body may prefer the unaltered environment over the discharge-affected environment. Biological criteria may be necessary to detect adverse ecological effects downstream of discharges, whether or not toxicity is expressed."

The Regional Board has argued however that they had discretion to redefine "ambient" and were not constrained by common dictionary definitions. The Regional Board's definition of "ambient" included the wastewater effluent.

The Superior Court (Superior Court of California (Case number 34-2009-80000309) (County of Sacramento, Judge Timothy M. Frawley, 26 January 2011) ruled that the common dictionary definition of ambient was applicable, but that "ambient" also included the downstream waters after complete mix with the wastewater effluent had occurred.

The proposed Permit continues to utilize the wastewater effluent hardness when establishing criteria for hardness dependant metals. This can best be observed by review of Tables F-4, F-5 and F-6 in which the "Fully Mixed Downstream Ambient Conditions" are based on the "Effluent Fraction" which ranges from 1% to 100%. This is also confirmed in the text regarding hardness in the Fact Sheet and by "equation 4" on page F-23 which is partly based on the "lowest observed effluent hardness".

The Regional Board in the proposed Permit continues to use the effluent as "ambient" in their calculation of criteria for hardness dependant metals contrary to common definition, the language in the SIP, guidance from the US Fish and Wildlife Service and the National Marine Fisheries Service and a ruling by the Superior Court.

Use of the "Surface Water Hardness"

Federal Regulation 40 CFR 131.38(c)(4) states that: "For purposes of calculating freshwater aquatic life criteria for metals from the equations in paragraph (b)(2) of this section, for waters with a hardness of 400 mg/l or less as calcium carbonate, the actual ambient hardness of the surface water shall be used in those equations." (Emphasis added).

As is stated above, the proposed Permit continues to utilize the wastewater effluent hardness when establishing criteria for hardness dependant metals. This can best be observed by review of Tables F-4, F-5 and F-6 in which the "Fully Mixed Downstream Ambient Conditions" are based on the "Effluent Fraction" which ranges from 1% to 100%. This is also confirmed in the text regarding hardness in the Fact Sheet and by "equation 4" on page F-23 which is partly based on the "lowest observed effluent hardness".

The wastewater effluent is not "surface water". The Regional Board has not argued this point but has steadfastly refused to acknowledge or discuss the CTR requirement that the hardness of the surface water be used in calculating the criteria for hardness dependant metals. The proposed Permit is again based on the hardness of the effluent, not surface water, for hardness dependant metals.

The "Emerick" Paper cannot be used

The proposed Permit relies on the "Emerick" paper in developing effluent limitations for hardness dependant metals. The "Emerick" paper is inappropriate for use based on the following:

- The "Emerick" paper does not utilize the hardness of the surface water but also heavily relies on the effluent hardness. Recall that 40 CFR 131.38 requires use of the actual ambient hardness of the surface water.
- The "Emerick" paper does not solely use the equations specified in 40 CFR 131.38(c)(4).
- The "Emerick" paper does not utilize the ambient hardness also heavily relies on the effluent hardness.
- The "Emerick" paper ignores the other important water qualities that affect metal toxicity (e.g., pH, alkalinity, dissolved organic carbon, calcium, sodium, chloride, etc.) and focuses solely on hardness. As can be seen the U.S. EPA's latest ambient criteria for copper (*Aquatic Life Ambient Freshwater Quality Criteria—Copper 2007 Revision*), the latest science utilizes these other quality that affect metal toxicity. Since EPA published the hardness-based recommendation for copper criteria in 1984, new data have become available on copper toxicity and its effects on aquatic life. The Biotic Ligand Model (BLM) – a metal bioavailability model that uses receiving water body characteristics to develop site-specific water quality criteria – utilizes the best available science and serves as the basis for the new national recommended criteria. The BLM requires ten input parameters to calculate a freshwater copper criterion (a saltwater BLM is not yet available): temperature, pH, dissolved organic carbon (DOC), calcium, magnesium, sodium, potassium, sulfate, chloride, and alkalinity. The BLM is used to derive the criteria rather than as a post-derivation adjustment as was the case with the hardness-

based criteria. This allows the BLM-based criteria to be customized to the particular water under consideration. The Regional Board failed to utilize the latest science in developing the proposed Permit.

Establishing a protective limitation

For the great majority of wastewater discharges to surface waters the hardness of the effluent is much greater than the hardness or the upstream surface water. In such cases, use of the higher hardness of the effluent to calculate discharge limitations for hardness dependant metals results in significantly less stringent discharge limitations. The "Emerick" method uses the higher effluent hardness to determine criteria as the effluent mixes with surface water. The Regional Board has used the "Emerick" method to generate these less stringent limitations stating that the methodology only eliminates what would have otherwise been overly protective limitations[1]. Adherence to the required CTR methodology using the lower surface water hardness would, under these circumstances, produce more stringent criteria. In reviewing the Central Valley Regional Board's NPDES permits it can be seen that use of the "Emerick" method is used by default, ignoring the mandated CTR method of calculating criteria for hardness dependant metals. It has been questioned whether the Regional Board's default use of the "Emerick" method constitutes an underground regulation. "Regulation" means <u>every</u> rule, regulation, order, or standard of general application or the amendment, supplement, or revision of <u>any</u> rule, regulation, order or standard adopted by <u>any</u> state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure." (Government Code section 11342.600).

The Regional Board cannot produce a technical defense that use of the CTR prescribed methods is overly protective. To the contrary, the US Fish and Wildlife Service and the National Marine Fisheries Service in their biological opinion and U.S. EPA in developing new ambient criteria for copper, all state that the use of hardness alone, ignoring temperature, pH, dissolved organic carbon (DOC), calcium, magnesium, sodium, potassium, sulfate, chloride, and alkalinity, may not be protective of water quality. The agencies, in their biological opinion, state that only the lower upstream hardness should be used to account for the inaccuracies of using hardness alone. The Regional Board does not present any technical information to rebut the technical fisheries and water quality standards development experts at US Fish and Wildlife Service, the National Marine Fisheries Service or U.S. EPA. The Regional Board has refused to discuss the technical merits of the opinions given by the US Fish and Wildlife Service, the National Marine Fisheries Service and U.S. EPA, stating only that the opinions address the CTR and are not applicable to individual permitting actions.

---

[1] See permits for Sacramento Regional (http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/sacramento/r5-2010-0114_npdes.pdf, at pages F-22 and 23), The City of Auburn (http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/placer/r5-2010-0090-01.pdf, page F-23 "An ECA based on a lower hardness (e.g., lowest upstream receiving water hardness) would also be protective, but would result in unreasonably stringent effluent limits considering the known conditions."), Placer County SMD-1 (http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/placer/r5-2010-0092.pdf, page F-26, "Use of a lower ECA (e.g., calculated based solely on the lowest upstream receiving water hardness) is also protective, but would lead to unreasonably stringent effluent limits considering the known conditions.")

There are a few unique circumstances when a wastewater discharge occurs at the headwaters of a stream or where the natural upstream surface water hardness is higher than the effluent hardness. Under the first circumstance there is no upstream surface water hardness. Under the circumstance where the upstream hardness is higher than the effluent hardness; use of the upstream surface water hardness will produce criteria that are not sufficiently protective of water quality. This is the condition observed at Deer Creek. The unique circumstances do not nullify the regulatory requirements to use the ambient surface water hardness or to use the CTR prescribed equations when calculating criteria for hardness dependant metals. There is however a legal and technically correct way to properly address these situations. The methodology to protect water quality in these rare events is prescribed in the federal regulations: the CTR method must be followed to show that the developed criteria are not protective of water quality; 40 CFR 122.44 (d)(1) should be cited as requiring the development of limitations more stringent than the promulgated effluent limitations, and; use of the CTR prescribed method using the lower hardness used to develop the more protective limitations. The Regional Board's consistent use of the "Emerick" method, and the Regional Board's assessment that use of the CTR prescribed methodology using the lowest observed hardness is overly protective, are without technical or legal merit.

2. The Proposed Permit Fails to Include an Effluent Limitation for Aluminum that is Protective of the Aquatic Life Beneficial Use of the Receiving Stream With Regard to Chronic Toxicity. The Proposed Permit Cites the Development of a Site Specific Water Quality Standard for Aluminum But Fails to Comply with all Regulatory Requirements for Development of such a Standard.

The Superior Court of California (Case number 34-2009-80000309) (County of Sacramento, Judge Timothy M. Frawley, 26 January 2011) ruled that:

> "The Court finds that this matter should be remanded to the Board to reconsider its effluent limitation for aluminum. In developing an effluent limitation for aluminum, the Board shall (a) either use the EPA chronic criterion for aluminum, or develop a site-specific standard for aluminum sufficient to protect freshwater aquatic life; and (b) conduct a pollutant variability analysis in determining the MEC for aluminum."

The proposed Permit, page 2 Finding No. 5, states that:

> "The Court required the Central Valley Water Board to either use the USEPA chronic criterion for aluminum or develop a site-specific standard for aluminum to protect freshwater aquatic life. A site-specific objective was developed by using site-specific data and studies, including the establishment of the arid West Technical Report as an applicable study for use at Deer Creek. Based on the site-specific data the narrative toxicity objective is not exceeded but a conservative limit of 200 μg/L per year was added because the pollutant variability analysis estimated the MEC to be greater than 200 μg/L."

The maximum measured wastewater effluent aluminum concentration at the Deer Creek wastewater treatment plant was 150 ug/l. The statistically projected maximum effluent concentration was 705 ug/l. (Permit F-37 and F-38)

Federal Regulations, 40 CFR 122.44 (d)(i), requires that; "Limitations must control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality." The Basin Plan contains a narrative water quality objective for toxicity that states in part that "[a]*ll waters shall be maintained free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, animal, or aquatic life*" (narrative toxicity objective). Where numeric water quality objectives have not been established, 40 CFR §122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a), proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information, or an indicator parameter. U.S. EPA developed National Recommended Ambient Water Quality Criteria for protection of freshwater aquatic life for aluminum to prevent toxicity to freshwater aquatic life. The recommended ambient criteria four-day average (chronic) and one-hour average (acute) criteria for aluminum are 87 μg/*l* and 750 μg/*l*, respectively.

US EPA's 87 ug/l chronic criterion was developed using low pH and hardness testing. California Central Valley waters, the Sacramento River, at the Valley floor, have been sampled to have hardnesses as low as 39 mg/l $CaCO_3$ by the USGS in February 1996 for the *National Water Quality Assessment Program.* Contributory streams, especially foothill streams, have also been sampled and shown to contain even lower hardness levels. US EPA recognized in their ambient criteria development document, (Ambient Water Quality Criteria for Aluminum, EPA 440/5-86-008) that the pH was in the range 6.5 to 6.6 and that the hardness was below 20 mg/l. Typical values for pH and hardness in the Central Valley alone warrant use of the chronic ambient criteria for aluminum. <u>Despite the hardness and pH values used in the development of the criteria; U.S. EPA's conclusions in their *Ambient Criteria for the Protection of Freshwater Aquatic Life* recommends that application of the ambient criteria as necessary to be protective of the aquatic beneficial uses of receiving waters in lieu of site-specific criteria.</u>

The Regional Board and their proposed Permit cites US EPA's *Ambient Criteria for the Protection of Freshwater Aquatic Life for Aluminum* (criteria) as not being representative or necessary because the chronic criteria were based on a low hardness and low pH. The Regional Board cites one section of the criteria development document but ignores the final recommendation to use the recommended criteria absent a site-specific objective for aluminum. The Regional Board's citation of the criteria development document is incomplete its review, for example the *criteria* development document (EPA 440/5-86-008) also cites that:

> 169 ug/l of aluminum caused a 24% reduction in the growth of young brook trout.
> 174 ug/l of aluminum killed 58% of the exposed striped bass.

> Bioaccumulation factors ranged from 50 to 231 for young brook trout exposed to aluminum for 15 days.
> Aluminum at 169 ug/l caused a 24% reduction in the weight of young brook trout.

These citations are particularly important as the Regional Board ignores the chronic toxicity impacts from the criteria document. The chronic toxicity endpoints are not only those that produce mortality but impact growth and reproduction in aquatic life where aquatic life is not limited to fish but also includes invertebrates and aquatic plants. The cited numbers from EPA's criteria document are particularly relevant in Deer Creek as trout have been documented to be present.

US EPA recommends that understanding the *Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses* is necessary in order to understand the text, tables and calculations of a criteria document. The Regional Board's assessment of the use of low hardness and low pH clearly shows they did not heed EPA's advice in reviewing the criteria development procedures for water quality criteria or the final recommendations. The Regional Board occasionally cites individual aluminum toxicity testing at various locations; again individual testing is not a valid replacement for developing fully protective criteria. A prime example of a state utilizing good water quality standards development techniques for developing a site specific standard for aluminum is the state of Indiana where a final chronic criterion of 174 ug/l was established in 1997. In 2003, Canada adopted pH dependant freshwater aquatic life criteria for aluminum that ranges from 84 ug/l to 252 ug/l. Ignoring the final recommendation of the criteria misses the protective intermediate measures to protect against mortality and reductions to growth and reproduction.

The Regional Board claims to have developed a site specific objective for aluminum. EPA's criteria document states that they did a complete literature search and evaluated all of the available scientifically valid information. As one can see from the Regional Board's inclusion of very limited aluminum data in their analysis, they only included the data that agrees with their desired outcome; the Arid West Report and limited toxicity tests under local wastewater discharger control. The Regional Board excluded all of the above cited data that indicate that lower levels of aluminum cause chronic toxicity.

Limitation time frames

Federal Regulation 40 CFR 122.45 (d)(2) requires that permit for POTWs establish Effluent Limitations as average weekly and average monthly unless impracticable. The proposed Permit, page 11, establishes Effluent Limitations for aluminum as an annual average contrary to the cited Federal Regulation. Establishing the Effluent Limitation for aluminum in accordance with the Federal Regulation is not impracticable. Proof of impracticability is properly a steep slope and the Regional Board has not presented any evidence that properly and legally limiting aluminum is impracticable. Impracticable – incapable of being put into practice with the available means; incapable of being performed or accomplished by the means employed or at hand.

Legal Requirements for Site specific Limitations

The proposed Permit, page 2 Finding 5, states that a site specific objective for aluminum was developed and is the basis for the limitations in the Permit. Federal and State laws and regulations specify the minimum requirements for developing site-specific standards and objectives. The Regional Board failed to cite or comply with any legal requirement in their development of the cited site specific objective for aluminum.

Federal Regulations 40 CFR 122.44

> (vi) Where a State has not established a water quality criterion for a specific chemical pollutant that is present in an effluent at a concentration that causes, has the reasonable potential to cause, or contributes to an excursion above a narrative criterion within an applicable State water quality standard, the permitting authority must establish effluent limits using one or more of the following options:
>
> > (A) Establish effluent limits using a calculated numeric water quality criterion for the pollutant which the permitting authority demonstrates will attain and maintain applicable narrative water quality criteria and will fully protect the designated use. Such a criterion may be derived using a proposed State criterion, or an explicit State policy or regulation interpreting its narrative water quality criterion, supplemented with other relevant information which may include: EPA's Water Quality Standards Handbook, October 1983, risk assessment data, exposure data, information about the pollutant from the Food and Drug Administration, and current EPA criteria documents; or
> >
> > (B) Establish effluent limits on a case-by-case basis, using EPA's water quality criteria, published under section 304(a) of the CWA, supplemented where necessary by other relevant information; or
> >
> > (C) Establish effluent limitations on an indicator parameter for the pollutant of concern, provided:
> >
> > > (*1*) The permit identifies which pollutants are intended to be controlled by the use of the effluent limitation;
> > >
> > > (*2*) The fact sheet required by §124.56 sets forth the basis for the limit, including a finding that compliance with the effluent limit on the indicator parameter will result in controls on the pollutant of concern which are sufficient to attain and maintain applicable water quality standards;
> > >
> > > (*3*) The permit requires all effluent and ambient monitoring necessary to show that during the term of the permit the limit on the indicator parameter continues to attain and maintain applicable water quality standards; and

(*4*) The permit contains a reopener clause allowing the permitting authority to modify or revoke and reissue the permit if the limits on the indicator parameter no longer attain and maintain applicable water quality standards.

Federal Regulations 40 CFR 131

§ 131.1 Scope.

This part describes the requirements and procedures for developing, reviewing, revising, and approving water quality standards by the States as authorized by section 303(c) of the Clean Water Act.

§ 131.5 EPA authority.

(a) Under section 303(c) of the Act, EPA is to review and to approve or disapprove State-adopted water quality standards. The review involves a determination of:

(1) Whether the State has adopted water uses which are consistent with the requirements of the Clean Water Act;

(2) Whether the State has adopted criteria that protect the designated water uses;

(3) Whether the State has followed its legal procedures for revising or adopting standards;

(4) Whether the State standards which do not include the uses specified in section 101(a)(2) of the Act are based upon appropriate technical and scientific data and analyses, and

(5) Whether the State submission meets the requirements included in §131.6 of this part and, for Great Lakes States or Great Lakes Tribes (as defined in 40 CFR 132.2) to conform to section 118 of the Act, the requirements of 40 CFR part 132.

(b) If EPA determines that the State's or Tribe's water quality standards are consistent with the factors listed in paragraphs (a)(1) through (a)(5) of this section, EPA approves the standards. EPA must disapprove the State's or Tribe's water quality standards and promulgate Federal standards under section 303(c)(4), and for Great Lakes States or Great Lakes Tribes under section 118(c)(2)(C) of the Act, if State or Tribal adopted standards are not consistent with the factors listed in paragraphs (a)(1) through (a)(5) of this section. EPA may also promulgate a new or revised standard when necessary to meet the requirements of the Act.

(c) Section 401 of the Clean Water Act authorizes EPA to issue certifications pursuant to the requirements of section 401 in any case where a State or interstate agency has no authority for issuing such certifications.

§ 131.6 Minimum requirements for water quality standards submission.

The following elements must be included in each State's water quality standards submitted to EPA for review:

(a) Use designations consistent with the provisions of sections 101(a)(2) and 303(c)(2) of the Act.

(b) Methods used and analyses conducted to support water quality standards revisions.

(c) Water quality criteria sufficient to protect the designated uses.

(d) An antidegradation policy consistent with §131.12.

(e) Certification by the State Attorney General or other appropriate legal authority within the State that the water quality standards were duly adopted pursuant to State law.

(f) General information which will aid the Agency in determining the adequacy of the scientific basis of the standards which do not include the uses specified in section 101(a)(2) of the Act as well as information on general policies applicable to State standards which may affect their application and implementation.

State Law
California Water Code, § 13241. Water quality objectives

Each regional board shall establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance; however, it is recognized that it may be possible for the quality of water to be changed to some degree without unreasonably affecting beneficial uses. Factors to be considered by a regional board in establishing water quality objectives shall include, but not necessarily be limited to, all of the following:

(a) Past, present, and probable future beneficial uses of water.
(b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.
(c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.
(d) Economic considerations.
(e) The need for developing housing within the region.
(f) The need to develop and use recycled water.

Federal regulation 40 CFR 131.11(b)(1)

(a) *Inclusion of pollutants:* (1) States must adopt those water quality criteria that protect the designated use. Such criteria must be based on sound scientific rationale and must contain sufficient parameters or constituents to protect the designated use. For waters with multiple use designations, the criteria shall support the most sensitive use.

(b) Form of criteria: In establishing criteria, States should: (1) Establish numerical values based on: (i) 304(a) Guidance; or (ii) 304(a) Guidance modified to reflect site-specific conditions; or (iii) Other scientifically defensible methods; (2) Establish narrative criteria or criteria based upon biomonitoring methods where numerical criteria cannot be established or to supplement numerical criteria.

Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, 2005, (SIP)

5.2 Site-Specific Objectives:

If a priority pollutant criterion or objective is inappropriate for a particular water body (i.e., it does not protect the beneficial uses or, based on site-specific conditions, a less stringent standard may be warranted), a water quality objective that differs from the applicable criterion or objective may be developed for the site.

Development of Site-Specific Objectives

Water quality objectives shall be developed in a manner consistent with State and federal law and regulations. In accordance with the State's Porter-Cologne Water Quality Control Act (Division 7 of the Water Code), objectives must provide for the reasonable protection of beneficial uses based on consideration of the factors listed in Water Code Section 13241. In accordance with federal law (CWA) and regulations (40 CFR 131.11, revised as of July 1, 1997), the objectives must be based on sound scientific rationale and protect the designated beneficial uses of the receiving water.

The RWQCB shall use scientifically defensible methods appropriate to the situation to derive the objectives. Such methods may include U.S. EPA-approved methods (e.g., Water Effects Ratio [WER] procedure, recalculation procedure, a combination of recalculation and WER procedures, Resident Species Procedure), and/or other methods specified in the workplan.

A site-specific objective adopted by the RWQCB may include a compliance schedule. However, if attainment of the potential objective(s) developed under the study is anticipated to be infeasible (as defined in 40 CFR 131.10(g), revised as of July 1, 1997), or if the RWQCB otherwise determines it is appropriate, a *use attainability analysis (UAA) may be conducted.

The RWQCB shall conduct, with the participation of interested persons, as appropriate, the UAA in accordance with 40 CFR 131.10(j) (revised as of July 1, 1997). If the UAA shows that attainment of the designated beneficial use(s) is not feasible (pursuant to 40 CFR 131.10(g) (revised as of July 1, 1997), the RWQCB shall designate an alternative beneficial use or subcategory of use, and develop appropriate water quality objectives to protect the new use(s). Both the use(s) and the objective(s) established to protect it would be reevaluated during the triennial reviews of the State's water quality standards.

Use of the Arid West Report

The Arid West Report is not applicable to this discharge.

1. The Arid West Report clearly states this is the case by presenting the map on page 3-1. The map clearly shows that the central valley is excluded from the report.

2. Page 3-2 of the Arid West Report characterizes the applicable water bodies for which the report is developed.

"The hydrology of arid west streams can affect the application of water quality standards, especially for ephemeral and effluent-dependent waters. For example:

> *Flashy nature of flow in ephemeral streams means that they are dry for significant lengths of time and then temporarily filled with water. Accordingly, the exposure duration assumptions inherent in federally recommended criteria may not be appropriate, and as such could be modified.* Deer Creek flows year round. The Deer Creek Wastewater treatment plant is mandated by the State Board, division of water rights to discharge a minimum flow year round.
>
> *Effluent-dependent streams are artificially created habitats where the ecological community present is, by definition, adapted to the flow regime, i.e., the existing aquatic life use is dependent on the nature of the waterbody created. The extent to which aquatic life becomes established in an effluent-dependent stream will be influenced by the duration and frequency of the effluent discharge. For example, some wastewater facilities are designed primarily to provide reclaimed water for reuse. However, occasionally these facilities may have to discharge to an ephemeral waterbody for a few days or weeks. The expectations for the aquatic community that develops downstream of these intermittently discharging facilities systems will be quite different from the community that develops in a waterbody that receives effluent all of the time.* The Deer Creek Wastewater treatment plant is mandated by the State Board, division of water rights to discharge a minimum flow year round.

The Arid West report states on page 3-4 that: *"Effluent-dependent streams support valuable riparian communities with high biodiversity of terrestrial plants and animals. In arid west waters, the differences between terrestrial vegetation upstream and downstream of a discharge can be striking, especially where the water is effluent-dependent*." The permit contains no information, and there is no information in the record showing that there is any difference between the upstream and downstream vegetation. To the contrary, CSPA representatives[2] have

[2] Richard McHenry as a Civil Engineer, worked for the Central Valley Regional Board from 1987 through 2006, for much of that time he was assigned direct responsibility as a senior engineer for the regulation of EID's Deer Creek

visited the Deer Creek wastewater treatment plant site on numerous occasions and found both the upstream and downstream vegetation along the Deer Creek riparian corridor to be lush and fully developed.

The Regional Board states in the proposed Permit, page F-31, that Deer Creek has the same characteristics as Arid West waters. Arid west waters are typified as dry stream beds where vegetation only exists downstream based on the wastewater being discharged; dry desert streambeds (see figure 3.2 on page 3.2 of the Arid West Report). Deer Creek is located east of Sacramento as the central valley rises into the Sierra Foothills south of the community of Cameron Park. There is nothing in the Deer Creek watershed that is similar to the waters described in the Arid West Report. An aerial map of the Deer Creek wastewater treatment plant, showing the surrounding vegetation can be seen at http://wikimapia.org/#lat=38.6274321&lon=-120.9842777&z=15&l=0&m=b&v=8&ifr=1.

The Arid West Report states on page 4-13 that: *"Although AWQC are designed to protect most species nationwide, criteria are derived from toxicity tests primarily with surrogate laboratory organisms. These surrogates are usually those species encountered in perennial streams in mesic environments, e.g., the eastern U.S., the Pacific Northwest, and the intermountain Rocky Mountains, such as rainbow trout. A much smaller body of toxicological knowledge exists for stream biota characteristic of the arid parts of the West. The responses of species adapted to effluent-dependent waters to discharged pollutants are even less well understood. EPA regulations and guidance documents provide a procedure to recalculate site-specific water quality criteria that reflect local, unique conditions, or exposed populations*." Deer Creek support a population of rainbow trout[3] unlike the waterbodies described in the Arid West Report.

The Regional Board has cited *Evaluation of the EPA Recalculation Procedure in the Arid West Technical Report* (May 2006). The title of the document infers recalculation of water quality criteria with the intent of developing site specific water quality criteria. This is confirmed in the *Forward* of the report presented on page ii (AR014031) which states that:

> "The purpose of this fifth report, *Evaluation of EPA Recalculation Procedure in Arid West Effluent Dependent Waters*, ("Recalculation Procedure Study") was to evaluate use of the Recalculation Procedure on selected water quality criteria with different modes of toxicity in specific arid West waters. In addition, based on the findings from this evaluation, a *User's Guide for Development of Site-Specific Water Quality Standards in*

---

wastewater treatment plant. Mr. McHenry was present and participated in numerous compliance inspections at the Deer Creek wastewater treatment plant.

[3] Direct observation by Mr. Richard McHenry and as cited from the Deer Creek permit R5-2002-0210, page 4 (e): "e. Preservation and Enhancement of Fish, Wildlife and Other Aquatic Resources. Deer Creek flows to the Cosumnes River. The California Department of Fish and Game (DFG) has verified that the fish species present in Deer Creek and downstream waters are consistent with both cold and warm water fisheries, that there is a potential for anadromous fish migration necessitating a cold water designation and that trout, a cold water species, have been found both upstream and downstream of the wastewater treatment plant. The Basin Plan (Table II-1) designates the Cosumnes River as being both a cold and warm freshwater habitat. Therefore, pursuant to the Basin Plan (Table II-1, Footnote (2)), the cold designation applies to Deer Creek. The cold-water habitat designation necessitates that the in-stream dissolved oxygen concentration be maintained at, or above, 7.0 mg/l."

> *Arid West Effluent-dependent Streams Using USEPA's Recalculation Procedure* was also prepared as a practical guide for water quality standards practitioners regarding use of the Recalculation Procedure for developing site-specific water quality standards."

The Regional Board has not however recalculated the criteria and begun the legally required process of modifying the water quality criteria. The Regional Board has circumvented the legal water quality standards development process and applied the recommended water quality levels for Arid West waterbodies in NPDES permits. This is not only contrary to the stated intent of the report but conflicts with federal and state requirements for developing water quality standards, including site-specific standards. The Regional Board has failed to follow the legally required procedures for developing water quality standards, 40 CFR Part 131. The Regional Board has also failed to comply with the California Water Code, Porter Cologne Section 13241.

The proposed Permit, page F-31, states that: "*The Technical Report found that* "*speciation and/or complexation of aluminum is highly dependent on ambient water quality characteristics and ultimately determines the mechanism of toxicity. [Increased] Concentrations of calcium in the water was shown to decrease toxic effects to fish."* Yet, any analysis of calcium concentrations in Deer Creek is not presented. The proposed Permit then states in the next paragraph that: "*There is no evidence that aluminum behaves differently in Deer Creek than in the Arid West Project water bodies, and no basis to expect that it would behave differently."* Clearly, if the Regional Board wishes to develop a site-specific objective for aluminum, the burden of proof is for them to prove that the proposed objective is fully protective of the beneficial uses of Deer Creek. None of the citations of the Arid west report appear to be applicable to Deer Creek.

Arid West Fish

The proposed Permit spends a lot of space discussing fish populations in Arid West waters and compares them to Deer Creek fish. Since the proposed permit fails to show that any other non-Arid West stream has different fish, the point is lost. The proposed Permit finally get to their point on page F-34 by stating that: "*Also, note that neither brook trout nor striped bass reside in Deer Creek, which are the two species USEPA developed the chronic criterion at 87 μg/L to protect. Additionally, Deer Creek does not support a resident, self-sustaining population of rainbow trout, which exhibits similar sensitivities as brook trout."* The operable word in the previous sentence is apparently "self sustaining" since the following documentation confirms the presence of trout in Deer Creek.

Waste Discharge Requirements, Order No. R5-2002-0210 states that:

> "*Preservation and Enhancement of Fish, Wildlife and Other Aquatic Resources. Deer Creek flows to the Cosumnes River. The California Department of Fish and Game (DFG) has verified that the fish species present in Deer Creek and downstream waters are consistent with both cold and warm water fisheries, that there is a potential for anadromous fish migration necessitating a cold water designation and that <u>trout, a cold water species, have been found both upstream and downstream of the wastewater</u>*

> *treatment plant.* *The Basin Plan (Table II-1) designates the Cosumnes River as being both a cold and warm freshwater habitat. Therefore, pursuant to the Basin Plan (Table II-1, Footnote (2)), the cold designation applies to Deer Creek. The cold-water habitat designation necessitates that the in-stream dissolved oxygen concentration be maintained at, or above, 7.0 mg/l.*" The Permit Finding was apparently based on a letter from the Department of Fish and Game dated 2 June 1999, which states in part that: *"... the fish species present in Deer Creek are consistent with both cold and warm water fisheries, that the potential for anadromous migration in Deer Creek necessitates a cold water designation and that trout, a cold water species, have been found both upstream and downstream of the wastewater treatment plant*."

The presence of trout on Deer Creek is also confirmed by El Dorado Irrigation District's consultants:

> *The three benthic macroinvertebrate surveys (CDFG 1995, 1998; SWRI 1996) and 5 fish surveys (JSA 1993; CDFG 1994; SWRI 1996; CDFG 1997; Nature Conservancy 1999) that have been conducted in Deer Creek between 1993 and 1999 (collectively from north of Hwy 50 to the confluence with the Cosumnes River – see Figure 1) documented that Deer Creek supports warm water ecosystems upstream and downstream of the Deer Creek Wastewater Treatment Plant (DCWWTP). Three rainbow trout were observed in the 1994 survey conducted by CDFG, but rainbow trout were not observed in any of the other 4 fish surveys that were conducted between 1993 and 1999. Hence, Deer Creek does not support a viable, self-sustaining population of rainbow trout, either upstream or downstream of the DCWWTP (Staff Report, Volume II, section 7.4.2 and Appendices G and H; SWRI 1996 for detailed biological and water temperature data for Deer Creek).*

The above cited CDFG fish survey identifies that the study area was upstream and downstream of the wastewater treatment plant. The locations of the other fish surveys were not clearly identified. However, areas identified as north of highway 50 or at the confluence with the Cosumnes River would not be located near the wastewater treatment plant.

The information in the record is contrary to the proposed Permit conclusion that the fish used by U.S. EPA in evaluating the toxicity of aluminum are absent in Deer Creek. Clearly, trout are present in Deer Creek and U.S. EPA's ambient criteria for aluminum are applicable.

The effects of pH and hardness

The proposed permit cites an Arid West based projected chronic toxicity limitation at the City of Auburn for aluminum of 287 ug/l, but discounts an association since the pH and hardness at Deer Creek are higher. Although not stated by the Regional Board their statement allowing that hardness and pH at higher values will render aluminum less toxic is from the footnote to U.S. EPA's ambient criteria for aluminum 1999 update. We must remind the Regional Board of their oft cited revised ambient criteria footnote for aluminum which also states in part that: "but the effects of pH and hardness are not well quantified at this time". The Regional Board uses the fact that Auburn and Deer Creek are located in the foothills at approximately the same elevation to conclude that they support the same aquatic life.

Arid West Calculations

Finally, in evaluating the Arid West Studies and developing their "site-specific" objective, permit page F-37, the Regional Board uses the mean hardness rather than the most protective lowest hardness in their calculations. The mean hardness would not represent the worst case, most protective, limitation for chronic toxicity. It would be comical if it were not so potentially lethal, that the Regional Board has gone to such extreme measures to use the effluent hardness in developing limitations for toxic metals, yet uses the even more relaxed mean downstream hardness when developing their "objective" for aluminum.

3. The proposed Permit fails to require that analysis of water quality be performed by a certified laboratory, contrary to the California Water Code Section 13176.

The Superior Court Order

CalSPA's contented that the Board abused its discretion by failing to require that monitoring for pH and temperature be conducted by a properly certified laboratory, as mandated by California Water Code section 13176.The Court concludes that this issue should be decided in the first instance by the Board, not by the Court. Accordingly, the Court shall issue a writ remanding this matter to the Board to consider whether it is legally and factually possible for the District to comply with the requirements of Water Code section 13176 in the manner suggested by CalSPA.

Legal Requirements

The law states that:

> **CWC § 13176. Certified laboratories** (a) The analysis of any material required by this division shall be performed by a laboratory that has accreditation or certification pursuant to Article 3 (commencing with Section 100825) of Chapter 4 of Part 1 of Division 101 of the Health and Safety Code. (b) No person or public entity of the state shall contract with a laboratory for environmental analyses for which the State Department of Health Services requires accreditation or certification pursuant to this chapter, unless the laboratory holds a valid certification or accreditation.
>
> CWC **§ 13383. Monitoring requirements** (a) The state board or a regional board may establish monitoring, inspection, entry, reporting, and recordkeeping requirements, as authorized by Sections 13160, 13376, or 13377 or by subdivisions (b) and (c) of this

section, for any person who discharges, or proposes to discharge, to navigable waters, any person who introduces pollutants into a publicly owned treatment works, any person who owns or operates, or proposes to own or operate, a publicly owned treatment works or other treatment works treating domestic sewage, or any person who uses or disposes, or proposes to use or dispose, of sewage sludge.

(b) The state board or the regional boards may require any person subject to this section to establish and maintain monitoring equipment or methods, including, where appropriate, biological monitoring methods, sample effluent as prescribed, and provide other information as may be reasonably required.

(c) The state board or a regional board may inspect the facilities of any person subject to this section pursuant to the procedure set forth in subdivision (c) of Section 13267.

California Health and Safety Code (HSC) section 100825 (b) Laboratories that perform analyses on any combination of environmental samples, …for regulatory purposes shall obtain a certificate of accreditation pursuant to this article.

HSC section 100825 (c) (3) "Certificate" means a document issued to a laboratory that has received certification or accreditation pursuant to this article.

HSC 100825 (c) (16) "Regulatory purposes" means a statutory or regulatory requirement of a state board, office, or department, or of a division or program that requires a laboratory certified under this article or of any other state or federal agency that requires a laboratory to be accredited.

The laws included in both the California Water Code and the Health and Safety Code is clear in the requirement that laboratories doing environmental analyses be certified. The Regional Board failed to require certification in the NPDES permit issued to El Dorado Irrigation District's Deer Creek Wastewater Treatment Plant for pH and temperature. Both pH and temperature are regulated under the permit and therefore subject to the cited laws. The original permit, which was the subject of CSPA's petition and eventual legal action, exempted El Dorado Irrigation District from conduction pH and temperature analyses at a certified laboratory without explanation. In response to the Superior Court's order; the permit has been modified to state that a $20,000 annual cost to conduct the analyses at a certified laboratory is overly expensive. The Regional Board does not cite any legal authority to exempt any Discharger from the legal requirements for laboratory certification.

A matter of routine

Since there was originally no explanation of exempting a Discharger from using certified laboratories to conduct required monitoring; recently adopted permits for other Dischargers were reviewed for similar exemptions.

Sacramento Regional County Sanitation District, Order No. R5-2010-0114, page E-2 No. C exempts the Discharger from lab certification for pH, turbidity, temperature and chlorine residual.
(http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/sacramento/r5-2010-0114_npdes.pdf)

City of Auburn, Wastewater Treatment Plant, Order No. R5-2010-0090-01, page E-1 No. C: "In the event a certified laboratory is not available to the Discharger, analyses performed by a noncertified laboratory will be accepted provided a Quality Assurance-Quality Control Program is instituted by the laboratory."
(http://www.swrcb.ca.gov/centralvalley/board_decisions/adopted_orders/placer/r5-2010-0090-01.pdf)

Based on a review of the above regional Board permits, it appears that the Regional Board routinely exempts wastewater Dischargers from the legal responsibility of conducting compliance monitoring at a certified laboratory, in the case of Auburn for apparently all parameters. An explanation of the technical or legal authority for such exemption could not be located in the permits.

The Regional Board's explanation

The following is an excerpt from the Deer Creek revised permit responding to the Court's Order:

> *"The Court required the Central Valley Water Board to "consider whether it is legally and factually possible for the District to comply with the requirements of Water Code section 13176 either (i) by having its on-site laboratory re-certified or (ii) by having certified laboratory personnel travel to the District's facility and conduct the testing on site." California Water Code section 13176 requires that the analysis of water qualify be performed by a laboratory that has accreditation or certification under the Health and Safety Code (Cal Water Code § 13176). To comply, Central Valley Water Board staff communicated separately with the District, with California Department of Public Health and State Water Board staff, and with three private laboratories within the vicinity of the Deer Creek Facility, and the findings are summarized below.*
>
> *Last year the El Dorado Irrigation District leased its on-site laboratory at its El Dorado Hills Wastewater Treatment Plant to a certified private contract lab in an effort to save costs, and therefore, it is factually impossible for the District to recertify their on-site lab at the El Dorado Hills Wastewater Treatment Plant until the lease agreement expires.*
>
> *There are four private certified labs with mobile units located within the vicinity of the District's facilities, which includes the private contract lab now located on-site. However, none of the labs' mobile units are currently certified nor provide this service. Based on conversations with three of the four private labs, it would be possible to acquire certification, and the monitoring fees are approximately $100 per hour, which includes travel time to and from the monitoring locations. Thus, the cost to the District ranges from $51,000 to $81,000 per year for each Facility.*

> *The District provided information that the on-site private lab at the El Dorado Hills Wastewater Treatment Plant can conduct the in-situ monitoring for an approximate annual cost of $20,000 per facility; however, the District's current budget is $19.661 million per year after recent local sewer fee increases, and the 2012 budget is projected at $20.362 million per year (www.eid.org/2011- 2012_OpBudget.pdf). The District states that they have reduced staff since 2008 by 34.8%, and increased sewerage fees up to 15%. Therefore, The Central Valley Water Board finds that the additional monitoring expense makes it economically impossible for the District to comply with the requirements of Water Code section 13176 without a further increase in local sewer fees".*

Closing their laboratory

The following is copied from *EID News*, 22 March 2010 (http://www.eid.org/doc_lib/03_news/2010/20100322_eidnews.pdf):

> *"We also laid off the four-person staff at our state-certified laboratory, where we test for water quality and perform other functions required by regulations," Abercrombie said. "We are contracting with a private firm that will rent our lab facilities, perform our testing, and seek other business in the area. The district achieves overall savings of $536,000 the first year and $322,000 per year thereafter through the reduced personnel costs at the lab and the rental income."*

Wastewater Chemistry and Operations
An easy fix for certification

In addition to compliance monitoring, wastewater treatment plant processes are monitored frequently by staff to assure the plant is operating properly. The following are excerpts from *Operation of Wastewater Treatment Plants (A field Study Training Program, Fourth edition, Volume II)* which is training guide for wastewater treatment plant operators:

> *"The pH test indicates whether a treatment process may continue to function properly at the pH measured. Each process in the plant has its own favorable range of pH which must be checked routinely." (Page 555)*

> *"Temperature is one of the most important factors affecting biological growth. Temperature measurements can be helpful in detecting changes in raw wastewater quality. For example, an influent temperature drop may indicate large volumes of cold water from infiltration. An increase in temperature may indicate that hot water by industry are reaching your plant*

> *Temperature is one of the most frequently taken tests. One of the many uses is to calculate the prevent saturation of dissolved oxygen in the DO test."*

Wastewater Treatment plants maintain a laboratory for operations control. Temperature and pH are typically measured using hand held devices; a thermometer and a pH meter. Even if EID did not maintain an operations laboratory, hand held devices would not require a dedicated area and could be certified independently.

An option for EID's Deer Creek wastewater treatment plant is to have the operations lab certified for pH and temperature.

Laboratory costs for pH and temperature sampling

The proposed Permit states that: "*the District's current budget is $19.661 million per year after recent local sewer fee increases, and the 2012 budget is projected at $20.362 million per year.*" The proposed Permit also indicates that the cost for an outside lab to conduct certified sampling and analysis is $20,000 per year. $20,000 is a small percentage of the total operating cost of $20,362,000.

Wastewater treatment plants have ever-changing conditions and maintenance requirements. One never knows when a pump or a sewer line may break. It is also not uncommon that engineering services are required for system analysis or to prepare a technical report. For these reasons, wastewater treatment plants generally keep a reserve fund to cover unexpected costs. It would be highly unusual for a utility with an annual budget of over $20 million not to have a reserve fund well in excess of $20,000, a tenth of a percent of the total budget. The Regional Board's assessment that a $20,000 expense at a facility with a budget over $20 million would necessitate a rate increase would appear at best to be without merit.

The proposed Permit cites that the average dry weather flow at the Deer Creek wastewater treatment plant is 3.6 million gallons per day. Without any significant industrial discharges, at an approximate discharge level of 100 gallons per person per day, the plant would serve approximately 36,000 people. Assuming a household is 2.5 people, $20,000 per year divided equally between the local households would not be significantly over a dollar per year.

Ready means of compliance

The Regional Board's explanation for failing to requiring analyses at certified labs only comes down to the cost to the district, no other defense, technical or legal, is presented. In any of the cases, whether the District can certify their operations laboratory for pH and temperature or certify only their handheld pH and temperature devices or utilize reserve funds to cover the costs from outside laboratory analysis. There are options other than raising sewer rates to achieve certification for pH and temperature analyses. While no one is in favor of higher serer rates; the Regional Board has not presented any technical or legal reason why an increased sewer rate excuses a wastewater Discharger from the requirement to conduct environmental analyses at a certified laboratory. The Regional Board has also not cited, if they believe this case is based on an economical hardship, why are other new permits being written with the same exemption (see above Sacramento Regional and City of Auburn citations).

Thank you for considering these comments. If you have questions or require clarification, please don't hesitate to contact us.

Ten realities for managing the Delta →

California's groundwater problems and prospects

Posted on January 30, 2013 by UC Davis Center for Watershed Sciences

Under the rocks and stones, there is water underground – Talking Heads

By Jay R. Lund and Thomas Harter

Groundwater is one of California's most ubiquitous, widely used resources that is unseen and misunderstood. Aquifers gather and store water and contaminants from large areas over decades to eons to support many human and ecosystem functions. We must manage groundwater wisely.

Groundwater is important to California in many ways. Roughly 30 percent of water deliveries in California come directly from groundwater, with much more in drought years, particularly long droughts (CDWR 2005, Megdal et al. 2009). Smaller urban and rural areas depend entirely on groundwater, as do many sizable cities, including Fresno. In all, 85 percent of Californians depend on groundwater for at least part of their drinking water. (SWRCB, 2012). The state's groundwater storage capacity is more than 10 times that of all its surface reservoirs. Groundwater removes some, but not all, forms of drinking water contaminants. Groundwater also accumulates contaminants with time, particularly salts and nitrate. Groundwater pumping energy is about 2% of California's electricity use (5,800 GwH/yr of total 280,000 GwH/yr). And many native species depend on streamflows and wetlands fed by springs and supported by high groundwater tables. California's multifaceted dependence on groundwater leads to diverse controversies and myths.

Where does groundwater come from? Groundwater comes from surface water, natural landscape recharge and irrigation return water. When pumping exceeds recharge, it depletes aquifer storage. Recharge from streams occurs when the groundwater table is lower than the stream. Natural landscape and irrigation water recharge occurs when unused water percolates to below the root zone of plants and crops. Percolation is vital to crops and ecosystems. Without some percolation, the root zone accumulates salinity that kills plant life. In some areas, recharge basins, injection wells and irrigation management are used to intentionally recharge and bank groundwater during wet years or winters when ample water is available, for long-term storage and use in dry years or summer. In much of California, groundwater pumping has significantly lowered groundwater levels, which often increases recharge from streams. Increased losses from streams to groundwater can reduce downstream flows and affect ecosystems, if not regulated by upstream dams. Ultimately, almost all groundwater used for irrigation and drinking water would have become streamflow were it not pumped. (The largest exception is chronically overdrafted aquifers, less than 10% of California's groundwater use.) .

Irrigation "inefficiency" is a major source of groundwater recharge. In the Central Valley and other agricultural regions of California, irrigation inefficiency is a major source of aquifer recharge (Ruud et al. 2004). In many areas, drought-year groundwater supplies depend substantially on irrigation inefficiency in wetter years, when surface water is available and used by farmers. Ironically, local inefficiency often improves regional water use efficiency and sustainability. However, excessive groundwater pumping causes long-term continual decline in groundwater levels ("overdraft") and irrigation inefficiency increases salt and nitrate loads to groundwater. There are few perfect solutions in water.

Groundwater problems in California vary greatly and are locally quite important.

- **Overdraft** in California today occurs in parts of the Central Valley, especially the Tulare Lake Basin, but also in some coastal and southern California basins with limited surface water supplies and intensive agriculture. During wet periods with more surface water deliveries, some overdraft reverses temporarily. Still, statewide overdraft is estimated diversely to average between 500,000 acre-feet a year to more than 1.5 million acre-feet a year, which amounts to 10-20 percent of all water use in the Tulare Lake Basin (Faunt et al 2009). Other Central Valley areas with groundwater overdraft are along the eastern margin of the San Joaquin Valley, including east of the Delta. Overdraft in much of the Sacramento Valley has been limited due to increased infiltration from streams induced by lower groundwater tables (Harou and Lund 2008; Faunt, et al. 2009). Overdraft in most of Southern California has largely ended by regulation from local groundwater adjudications and water imports (Blomquist 1998). In Southern California, the Tulare Lake Basin and elsewhere, drawdown of aquifers has created empty groundwater storage capacity used to store water from wet years for droughts (Vaux 1986; Jenkins 1998; Hanak et al. 2012). The Tulare Lake Basin's long dependence on the Delta and overdraft for about 60 percent of its water supplies is a major regional and statewide challenge. The Tulare Lake Basin uses more water than any other region of California – about 8 million acre-feet a year. Delta imports and San Joaquin River diversion supply about 3 million acre-feet; local streams, 3.2 million acre-feet; local groundwater inflows from precipitation, 1.1 million acre-feet; and 0.7-1.5 million acre-feet from groundwater overdraft (Hanak et al. 2011; CDWR 2009). The high value of Tulare Lake Basin agriculture, its dependence on water imports and overdraft, and the accumulation of salts and nitrate in this closed basin raise substantial long-term economic and social challenges for this region and the state (Chou 2012).

- **Nitrate contamination** is one of the most widespread groundwater problems worldwide and in California, affecting drinking water supplies in many agricultural or historically agricultural areas. While even large cities such as Fresno are affected, nitrate contamination is most expensive for small rural water supplies that lack economies of scale. Nitrate contamination affects many groundwater-dependent systems in California, including more than 200,000 people in small and household wells in the Tulare and Salinas basins (Harter et al. 2012). Most nitrate contamination is from agricultural fertilizers, although other sources, notably septic tanks and dairies, can be important locally. Most agricultural areas can expect nitrate contamination of drinking water supplies. Source control of nitrate discharge is only a partial long-term solution because of the large extent of contamination and its decades of travel in groundwater. Providing drinking water solutions and compensation for affected communities now and into the foreseeable future is an unavoidable and urgently needed response (Harter et al 2012). Nitrate problems for drinking water are often compounded by naturally occurring arsenic, chromium, uranium, and other groundwater contaminants (SWRCB 2012).

- **Salinity accumulation** is another long-term groundwater quality challenge. Salt accumulation is particularly problematic on the Westside of the Tulare Lake and San Joaquin basins, which lack much ability to export salt from imported water or local soils – affecting about 500,000 acres of farmland (SJVDP 1990). In many other parts of California, such as the cities of Davis and Woodland, the accumulation of salts in groundwater is threatening the viability of urban groundwater water use, because of wastewater regulations regarding the consequently higher salinity in urban wastewater discharges. Statewide, major sources of salt are local soils and aquifers, irrigation water, animal farming, and municipal and industrial wastes – including salts from water softeners. Salts in irrigation water and wastewater applied to crops or urban landscapes are concentrated by evapotranspiration from plants, leaving salts behind. Salinity accumulation has a history of ending agriculture in arid regions (Hillel 2000).

- **Land subsidence** resulting from groundwater use has been considerable in some areas, particularly in the Tulare Lake and San Joaquin basins. In the mid-20th century, land subsidence in the San Joaquin Valley and Tulare Lake basins has ranged from a few feet to over 30 feet (Poland et al 1975; Faunt et al. 2009). Due to decreasing groundwater levels, land subsidence is recurring and remains a threat in these regions (Corbett et al. 2011). While physically remarkable, there has been insufficient analysis of the occurrence and implications of subsidence and little accounting of the long-term economic costs. However, regional subsidence can incur potentially large costs from flooding and insufficient slopes on canal and drainage systems.

- **Decreased streamflows** have occurred on many California streams, as groundwater levels were lowered from pre-development levels. Lowered groundwater levels drain water from rivers, stressing ecosystems during low-flow times (Harou and Lund 2008; Faunt et al. 2009). Ironically, streams with an upstream dam now often have higher summer streamflows than they would have with natural runoff, despite surrounding groundwater levels being lowered. Reservoir operations delivering summer streamflow significantly contribute to groundwater recharge. But in unmanaged rivers, pumping drains water from riparian ecosystems (Fleckenstein et al. 2004; Harter and Hines 2008; Howard and Merrifield 2010) and more generally undermines surface supplies for junior surface water right holders (who sometimes respond by increasing their own groundwater pumping).

Should the State do anything?

- **The sky is not falling, in most places.** California has widespread groundwater problems, and probably always will. California is a dry place, after all. Many groundwater problems are severe, growing and local. Some groundwater problems could benefit from state action, but California's groundwater problems must be solved mostly at local and regional levels, perhaps with some state legal, financial, and technical help. The state can provide better institutional and information frameworks to help locals solve local and regional groundwater problems.

- **Many local groundwater problems are being handled well locally.** California has had a remarkable record of effective local groundwater management (Nelson 2011, 2012; ACWA 2011; Blomquist 1992). Historical overdraft in some areas of California has been eliminated or limited by build-out of surface water projects, and more recently by effective local conjunctive use in much of the Central Valley or groundwater adjudication in Southern California. In other areas, problems of groundwater depletion remain. Groundwater quality management has been much more difficult, with accumulations of salt and nitrate having so far defied local solutions. Groundwater quality and groundwater overdraft management are closely linked, as are groundwater and surface water. Creative regional solutions that consider these broader scales and interconnections are needed. Support for successful development of stakeholder supported local-regional management is also critical.

Some state reforms would be useful.

1. **Official information is important.** State agencies should declare areas at risk of nitrate and salinity contamination. Many domestic well users will not know of contamination without such official declarations. And local governments and

interests are likely to lack capacity or incentive to address long-term groundwater contamination issues without the attention of state agencies.

2. **Effective compensation is needed more than source control.** Source control for large-scale groundwater problems, such as nitrate and salt contamination, often take decades to be effective, but people drink from and use these aquifers every day. Declarations of at-risk areas should trigger compensation mechanisms for affected water users, while long-term source control policies are developed and implemented. Long-term source control poses a dilemma for the state, as even the best source control may not provide clean recharge and large-scale groundwater degradation often requires decades of response time. Because degradation in some aquifers is long-term and perhaps permanent for nitrate and salinity, providing mechanisms for information and compensation are key state roles.
3. **Better data and science.** Much data is available on groundwater in California, but too much of it is poorly organized, not in electronic format or hidden by secrecy rules. Consequently, little synthetic work is done to develop insights from these data. A serious technical program is needed, at arm's length from stakeholders, to develop the perspective and insights needed for informed public policy and management discussions and actions. State efforts to account for and model groundwater have been missing and hindered by data problems, but advanced substantially for the Central Valley with the recent California Department of Water Resources C2VSIM model and the U.S. Geological Survey model, CVHM. While both substantially improve answers to major groundwater questions, they still have great potential for further improvement.
4. **Security of groundwater rights and integrated regional water management.** Except in adjudicated groundwater basins, where courts have divided and allocated groundwater rights and established watermasters and enforcement mechanisms, most groundwater use in California is largely unregulated. Environmental limits on some surface water supplies for agriculture and urban users have stressed groundwater to levels not seen since the 1950s and '60s. In addition, large-scale groundwater quality management, driven by the state's nutrient and salt management policy, is becoming intimately intertwined with water quantity management. The state needs to find a way to more expeditiously establish groundwater use rights in ways compatible with separately regulated water quality and with physically connected, but legally separated surface water rights. Groundwater recharge management, integrated with

groundwater quality management, in both urban areas and agricultural areas must become part of state and local groundwater protection strategies.

5. **The major overdraft areas of California create substantial economic value.** In the Tulare Lake Basin and numerous smaller basins, groundwater is mined, as one would deplete gold, oil and other mineral deposits. Are there areas of California where depletion of water should be viewed and accepted economically? In many areas, new solutions should be sought to increase groundwater banking and conjunctive use that allow water users to work within a long-term water budget, particularly in agricultural regions. This approach would provide a sustainable future for groundwater reservoirs (Scanlon et al., 2012; Hanak et al. 2012).

California will always have groundwater problems, and its dependence on groundwater is likely to increase with changes in demands, climate and environmental regulations. Success will be in how effectively groundwater is managed, especially in managing groundwater together with other water supplies and demands. Effective management will require state and regional frameworks of information, organization and authorities that help local water managers work effectively and transparently. Effective management of overdraft, salinization and contamination also will require a long-term perspective and serious technical efforts – through the end of the 21st century and beyond. This requires an important, if limited, role for the state.

Jay R. Lund is the Ray B. Krone Professor of Civil and Environmental Engineering at UC Davis and director of the university's Center for Watershed Sciences. Thomas Harter holds the Robert M. Hagan Endowed Chair in Water Management and Policy at UC Davis.

Preamble – Purpose and Scope – Structure of the Policy

3/20/2012

Preamble

Onsite wastewater treatment systems (OWTS) are useful and necessary structures that allow habitation at locations that are removed from centralized wastewater treatment systems. When properly sited, designed, operated, and maintained, OWTS treat domestic wastewater to reduce its polluting impact on the environment and most importantly protect public health. Estimates for the number of installations of OWTS in California at the time of this Policy are that more than 1.2 million systems are installed and operating. The vast majority of these are functioning in a satisfactory manner and meeting their intended purpose.

However there have been occasions in California where OWTS for a varied list of reasons have not satisfactorily protected either water quality or public health. Some instances of these failures are related to the OWTS not being able to adequately treat and dispose of waste as a result of poor design or improper site conditions. Others have occurred where the systems are operating as designed but their densities are such that the combined effluent resulting from multiple systems is more than can be assimilated into the environment. From these failures we must learn how to improve our usage of OWTS and prevent such failures from happening again.

As California’s population continues to grow, and we see both increased rural housing densities and the building of residences and other structures in more varied terrain than we ever have before, we increase the risks of causing environmental damage and creating public health risks from the use of OWTS. What may have been effective in the past may not continue to be as conditions and circumstances surrounding particular locations change. So necessarily more scrutiny of our installation of OWTS is demanded of all those involved, while maintaining an appropriate balance of only the necessary requirements so that the use of OWTS remains viable.

Purpose and Scope of the Policy

The purpose of this Policy is to allow the continued use of OWTS, while protecting water quality and public health. This Policy recognizes that responsible local agencies can provide the most effective means to manage OWTS on a routine basis. Therefore as an important element, it is the intent of this policy to efficiently utilize and improve upon where necessary existing local programs through coordination between the State and local agencies. To accomplish this purpose, this Policy establishes a statewide, risk-based, tiered approach for the regulation and management of OWTS installations and replacements and sets the level of performance and protection expected from OWTS. In particular, the Policy requires actions for identified areas where OWTS contribute to water quality degradation that adversely affect beneficial uses.

Final Draft

Preamble – Purpose and Scope – Structure of the Policy

3/20/2012

This Policy only authorizes subsurface disposal of domestic strength, and in limited instances high strength, wastewater and establishes minimum requirements for the permitting, monitoring, and operation of OWTS for protecting beneficial uses of waters of the State and preventing or correcting conditions of pollution and nuisance. And finally, this Policy also conditionally waives the requirement for owners of OWTS to apply for and receive Waste Discharge Requirements in order to operate their systems when they meet the conditions set forth in the Policy. Nothing in this Policy supersedes or requires modification of Total Maximum Daily Loads or Basin Plan prohibitions of discharges from OWTS.

This Policy applies to OWTS on federal, state, and Tribal lands to the extent authorized by law or agreement.

Structure of the Policy

This Policy is structured into ten major parts:

Definitions
Definitions for all the major terms used in this Policy are provided within this part and wherever used in the Policy the definition given here overrides any other possible definition.
[Section 1]

Responsibilities and Duties
Implementation of this Policy involves individual OWTS owners; local agencies, be they counties, cities, or any other subdivision of state government with permitting powers over OWTS; Regional Water Quality Control Boards; and the State Water Resources Control Board.
[Sections 2, 3, 4, and 5]

Tier 0 – Existing OWTS
Existing OWTS that are properly functioning, and do not meet the conditions of failing systems or otherwise require corrective action (for example, to prevent groundwater impairment) as specifically described in Tier 4, and are not determined to be contributing to an impairment of surface water as specifically described in Tier 3, are automatically included in Tier 0.
[Section 6]

Final Draft

Preamble – Purpose and Scope – Structure of the Policy

3/20/2012

Tier 1 – Low-Risk New or Replacement OWTS
New or replacement OWTS that meet low risk siting and design requirements as specified in Tier 1, where there is not an approved Local Agency Management Program per Tier 2.
[Sections 7 and 8]

Tier 2 – Local Agency Management Program for New or Replacement OWTS
California is well known for its extreme range of geological and climatic conditions. As such, the establishment of a single set of criteria for OWTS would either be too restrictive so as to protect for the most sensitive case, or would have broad allowances that would not be protective enough under some circumstances. To accommodate this extreme variance, local agencies may submit management programs ("Local Agency Management Programs") for approval, and upon approval then manage the installation of new and replacement OWTS under that program.

Local Agency Management Programs approved under Tier 2 provide an alternate method from Tier 1 programs to achieve the same policy purpose, which is to protect water quality and public health. In order to address local conditions, Local Agency Management Programs may include standards that differ from the Tier 1 requirements for new and replacement OWTS contained in Sections 7 and 8. As examples, a Local Agency Management Program may authorize different soil characteristics, usage of seepage pits, and different densities for new developments. Once the Local Agency Management Program is approved, new and replacement OWTS that are included within the Local Agency Management Program may be approved by the Local Agency. A Local Agency, at its discretion, may include Tier 1 standards within its Tier 2 Local Agency Management Program for some or all of its jurisdiction. However, once a Local Agency Management Program is approved, it shall supersede Tier 1 and all future OWTS decisions will be governed by the Tier 2 Local Agency Management Program until it is modified, withdrawn, or revoked.
[Section 9]

Tier 3 – Impaired Areas
OWTS that are near impaired water bodes may be addressed by a TMDL and its implementation program, or special provisions contained in a Local Agency Management Program. If there is no TMDL or special provisions, new or replacement OWTS within 600 feet of impaired water bodies listed in Attachment 2 must meet the specific requirements of Tier 3.
[Section 10]

Final Draft

Preamble – Purpose and Scope – Structure of the Policy

3/20/2012

Tier 4 – OWTS Requiring Corrective Action
OWTS that require corrective action or are either presently failing or fail at any time while this Policy is in effect are automatically included in Tier 4 and must follow the requirements as specified.
[Section 11]

Conditional Waiver of Waste Discharge Requirements
The requirement to submit a report of waste discharge for discharges from OWTS that are in conformance with this policy is waived.
[Section 12]

Effective Date
When this Policy becomes effective.
[Section 13]

Financial Assistance
Procedures for local agencies to apply for funds to establish low interest loan programs for the assistance of OWTS owners in meeting the requirements of this Policy.
[Section 14]

Attachment 1
AB 885 Regulatory Program Timelines.

Attachment 2

Tables 4 and 5 specifically identify those impaired water bodies that have Tier 3 requirements and must have a completed TMDL by the date specified.

Attachment 3

Table 6 shows where one Regional Water Board has been designated to review and, if appropriate, approve new Local Agency Management Plans for a local agency that is within multiple Regional Water Boards' jurisdiction.

What Tier Applies to my OWTS?

Existing OWTS that conform to the requirements for Tier 0 will remain in Tier 0 as long as they continue to meet those requirements. An existing OWTS will temporarily move from Tier 0 to Tier 4 if it is determined that corrective action is needed. The existing OWTS will return to Tier 0 once the corrective action is completed. Any major repairs conducted as corrective action must comply with Tier 1 requirements or Tier 2 requirements, whichever are in effect for that local area. An existing OWTS will move from Tier 0 to Tier 3 if it is adjacent to an impaired water body listed on Attachment 2, or is covered by a TMDL implementation plan.

Final Draft

Preamble – Purpose and Scope – Structure of the Policy

3/20/2012

In areas with no approved Local Agency Management Plan, new and replacement OWTS that conform to the requirements of Tier 1 will remain in Tier 1 as long as they continue to meet those requirements. A new or replacement OWTS will temporarily move from Tier 1 to Tier 4 if it is determined that corrective action is needed. The new or replacement OWTS will return to Tier 1 once the corrective action is completed. A new or replacement OWTS will move from Tier 1 to Tier 3 if it is adjacent to an impaired water body, or is covered by a TMDL implementation plan.

In areas with an approved Local Agency Management Plan, new and replacement OWTS that conform to the requirements of the Tier 2 Local Agency Management Plan will remain in Tier 2 as long as they continue to meet those requirements. A new or replacement OWTS will temporarily move from Tier 2 to Tier 4 if it is determined that corrective action is needed. The new or replacement OWTS will return to Tier 2 once the corrective action is completed. A new or replacement OWTS will move from Tier 2 to Tier 3 if it is adjacent to an impaired water body, or is covered by a TMDL implementation plan, or is covered by special provisions for impaired water bodies contained in a Local Agency Management Program.

Existing, new, and replacement OWTS in specified areas adjacent to water bodies that are identified by the State Water Board as impaired for pathogens or nitrogen and listed in Attachment 2 are in Tier 3. Existing, new, and replacement OWTS covered by a TMDL implementation plan, or covered by special provisions for impaired water bodies contained in a Local Agency Management Program are also in Tier 3. These OWTS will temporarily move from Tier 3 to Tier 4 if it is determined that corrective action is needed. The new or replacement OWTS will return to Tier 3 once the corrective action is completed.

Existing, new, and replacement OWTS that do not conform with the requirements to receive coverage under any of the Tiers (e.g., existing OWTS with a projected flow of more than 10,000 gpd) do not qualify for this Policy’s conditional waiver of waste discharge requirements, and will be regulated separately by the applicable Regional Water Board.

Final Draft

Definitions

3/20/2012

1.0 Definitions. The following definitions apply to this Policy:

"303 (d) list" means the same as "**Impaired Water Bodies.**"

"At-grade system" means an OWTS dispersal system with a discharge point located at the preconstruction grade (ground surface elevation). The discharge from an at-grade system is always subsurface.

"Basin Plan" means the same as "water quality control plan" as defined in Division 7 (commencing with Section 13000) of the Water Code. Basin Plans are adopted by each Regional Water Board, approved by the State Water Board and the Office of Administrative Law, and identify surface water and groundwater bodies within each Region's boundaries and establish, for each, its respective beneficial uses and water quality objectives. Copies are available from the Regional Water Boards, electronically at each Regional Water Boards website, or at the State Water Board's *Plans and Policies* web page (http://www.waterboards.ca.gov/plans_policies/).

"Bedrock" means the rock, usually solid, that underlies soil or other unconsolidated, surficial material.

"CEDEN" means California Environmental Data Exchange Network and information about it is available at the State Water Boards website or http://www.ceden.org/index.shtml.

"Cesspool" means an excavation in the ground receiving domestic wastewater, designed to retain the organic matter and solids, while allowing the liquids to seep into the soil. Cesspools differ from seepage pits because cesspool systems do not have septic tanks and are not authorized under this Policy. The term cesspool does not include pit-privies and out-houses which are not regulated under this Policy.

"Clay" means a soil particle; the term also refers to a type of soil texture. As a soil particle, clay consists of individual rock or mineral particles in soils having diameters <0.002 mm. As a soil texture, clay is the soil material that is comprised of 40 percent or more clay particles, not more than 45 percent sand and not more than 40 percent silt particles using the USDA soil classification system.

"Cobbles" means rock fragments 76 mm or larger using the USDA soil classification systems.

"Dispersal system" means a leachfield, seepage pit, mound, at-grade, subsurface drip field, evapotranspiration and infiltration bed, or other type of system for final wastewater treatment and subsurface discharge.

Final Draft

Definitions

3/20/2012

"Domestic wastewater" means wastewater with a measured strength less then high-strength wastewater and is the type of wastewater normally discharged from, or similar to, that discharged from plumbing fixtures, appliances and other household devices including, but not limited to toilets, bathtubs, showers, laundry facilities, dishwashing facilities, and garbage disposals. Domestic wastewater may include wastewater from commercial buildings such as office buildings, retail stores, and some restaurants, or from industrial facilities where the domestic wastewater is segregated from the industrial wastewater. Domestic wastewater does not include wastewater from industrial processes or RV dump stations.

"Dump Station" means a facility intended to receive the discharge of wastewater from a holding tank installed on a recreational vehicle. A dump station does not include a full hook-up sewer connection similar to those used at a recreational vehicle park.

"Domestic well" means a groundwater well that provides water for human consumption and is not regulated by the California Department of Public Health.

"Earthen material" means a substance composed of the earth's crust (i.e. soil and rock).

"EDF" see "electronic deliverable format."

"Effluent" means sewage, water, or other liquid, partially or completely treated or in its natural state, flowing out of a septic tank, aerobic treatment unit, dispersal system, or other OWTS component.

"Electronic deliverable format" or **"EDF"** means the data standard adopted by the State Water Board for submittal of groundwater quality monitoring data to the State Water Board's internet-accessible database system Geotracker (http://geotracker.waterboards.ca.gov/).

"Escherichia coli" means a group of bacteria predominantly inhabiting the intestines of humans or other warm-blooded animals, but also occasionally found elsewhere. Used as an indicator of human fecal contamination.

"Existing OWTS" means an OWTS that was constructed and operating prior to the effective date of this Policy, and OWTS for which a construction permit has been issued prior to the effective date of the Policy.

"Gravel-less chamber" system means a buried structure used to create an aggregate-free absorption area for infiltration and treatment of wastewater.

"Grease interceptor" means a passive interceptor that has a rate of flow exceeding 50 gallons-per-minute and that is located outside a building. Grease interceptors are used for separating and collecting grease from wastewater.

"Groundwater" means water below the land surface that is at or above atmospheric pressure.

Final Draft

Definitions

3/20/2012

"High-strength wastewater" means wastewater having a 30-day average concentration of biochemical oxygen demand (BOD) greater than 300 milligrams-per-liter (mg/L) or of total suspended solids (TSS) greater than 330 mg/L or a fats, oil, and grease (FOG) concentration greater than 100 mg/L prior to the septic tank or other OWTS treatment component.

"IAPMO" means the International Association of Plumbing and Mechanical Officials.

"Impaired Water Bodies" means those surface water bodies or segments thereof that are identified on a list approved first by the State Water Board and then approved by US EPA pursuant to Section 303(d) of the federal Clean Water Act.

"Local agency" means any subdivision of state government that has responsibility for permitting the installation of and regulating OWTS within its jurisdictional boundaries; typically a county, city, or special district.

"Major repair" means either: (1) for a dispersal system, repairs required for an OWTS dispersal system due to surfacing wastewater effluent from the dispersal field and/or wastewater backed up into plumbing fixtures because the dispersal system is not able to percolate the design flow of wastewater associated with the structure served, or (2) for a septic tank, repairs required to the tank for a compartment baffle failure or tank structural integrity failure such that either wastewater is exfiltrating or groundwater is infiltrating.

"Mottling" means a soil condition that results from oxidizing or reducing minerals due to soil moisture changes from saturated to unsaturated over time. Mottling is characterized by spots or blotches of different colors or shades of color (grays and reds) interspersed within the dominant color as described by the USDA soil classification system. This soil condition can be indicative of historic seasonal high groundwater level, but the lack of this condition may not demonstrate the absence of groundwater.

"Mound system" means an aboveground dispersal system (covered sand bed with effluent leachfield elevated above original ground surface inside) used to enhance soil treatment, dispersal, and absorption of effluent discharged from an OWTS treatment unit such as a septic tank. Mound systems have a subsurface discharge.

"New OWTS" means an OWTS permitted after the effective date of this Policy.

"NSF" means NSF International (a.k.a. National Sanitation Foundation), a not for profit, non-governmental organization that develops health and safety standards and performs product certification.

"Onsite wastewater treatment system(s)" (**OWTS**) means individual disposal systems, community collection and disposal systems, and alternative collection and disposal systems that use subsurface disposal. The short form of the term may be singular or plural. OWTS do not include "graywater" systems pursuant to Health and Safety Code Section 17922.12.

Final Draft

Definitions

3/20/2012

"Percolation test" means a method of testing water absorption of the soil. The test is conducted with clean water and test results can be used to establish the dispersal system design.

"Permit" means a document issued by a local agency that allows the installation and use of an OWTS, or waste discharge requirements or a waiver of waste discharge requirements that authorizes discharges from an OWTS.

"Person" means any individual, firm, association, organization, partnership, business trust, corporation, company, State agency or department, or unit of local government who is, or that is, subject to this Policy.

"Pit-privy" (a.k.a. outhouse, pit-toilet) means self-contained waterless toilet used for disposal of non-water carried human waste; consists of a shelter built above a pit in the ground into which human waste falls.

"Policy" means this Policy for Siting, Design, Operation and Management of OWTS.

"Pollutant" means any substance that alters water quality of the waters of the State to a degree that it may potentially affect the beneficial uses of water, as listed in a Basin Plan.

"Projected flows" means wastewater flows into the OWTS determined in accordance with any of the applicable methods for determining average daily flow in the *USEPA Onsite Wastewater Treatment System Manual, 2002,* or for Tier 2 in accordance with an approved Local Agency Management Program.

"Public Water System" is a water system regulated by the California Department of Public Health or a Local Primacy Agency pursuant to Chapter 12, Part 4, California Safe Drinking Water Act, Section 116275 (h) of the California Health and Safety Code.

"Public Water Well" is a ground water well serving a public water system. A spring which is not subject to the California Surface Water Treatment Rule (SWTR), CCR, Title 22, sections 64650 through 64666 is a public well.

"Qualified professional" means an individual licensed or certified by a State of California agency to design OWTS and practice as professionals for other associated reports, as allowed under their license or registration. Depending on the work to be performed and various licensing and registration requirements, this may include an individual who possesses a registered environmental health specialist certificate or is currently licensed as a professional engineer or professional geologist. For the purposes of performing site evaluations, Soil Scientists certified by the Soil Science Society of America are considered qualified professionals. A local agency may modify this definition as part of its Local Agency Management Program.

Final Draft

Definitions

3/20/2012

“Regional Water Board” is any of the Regional Water Quality Control Boards designated by Water Code Section 13200. Any reference to an action of the Regional Water Board in this Policy also refers to an action of its Executive Officer, including the conducting of public hearings, pursuant to any general or specific delegation under Water Code Section 13223.

“Replaced OWTS” means an OWTS that has its treatment capacity expanded, or its dispersal system replaced or added onto, after the effective date of this Policy.

“Sand” means a soil particle; this term also refers to a type of soil texture. As a soil particle, sand consists of individual rock or mineral particles in soils having diameters ranging from 0.05 to 2.0 millimeters. As a soil texture, sand is soil that is comprised of 85 percent or more sand particles, with the percentage of silt plus 1.5 times the percentage of clay particles comprising less than 15 percent.

“Seepage pit” means a drilled or dug excavation, three to six feet in diameter, either lined or gravel filled, that receives the effluent discharge from a septic tank or other OWTS treatment unit for dispersal.

“Septic tank” means a watertight, covered receptacle designed for primary treatment of wastewater and constructed to:

1. Receive wastewater discharged from a building;
2. Separate settleable and floating solids from the liquid;
3. Digest organic matter by anaerobic bacterial action;
4. Store digested solids; and
5. Clarify wastewater for further treatment with final subsurface discharge.

“Service provider” means a person capable of operating, monitoring, and maintaining an OWTS in accordance to this Policy.

“Silt” means a soil particle; this term also refers to a type of soil texture. As a soil particle, silt consists of individual rock or mineral particles in soils having diameters ranging from between 0.05 and 0.002 mm. As a soil texture, silt is soil that is comprised as approximately 80 percent or more silt particles and not more than 12 percent clay particles using the USDA soil classification system.

“Site” means the location of the OWTS and, where applicable, a reserve dispersal area capable of disposing 100 percent of the design flow from all sources the OWTS is intended to serve.

“Site Evaluation” means an assessment of the characteristics of the site sufficient to determine its suitability for an OWTS to meet the requirements of this Policy.

Final Draft

Definitions

3/20/2012

"Soil" means the naturally occurring body of porous mineral and organic materials on the land surface, which is composed of unconsolidated materials, including sand-sized, silt-sized, and clay-sized particles mixed with varying amounts of larger fragments and organic material. The various combinations of particles differentiate specific soil textures identified in the soil textural triangle developed by the United States Department of Agriculture (USDA) as found in Soil Survey Staff, USDA; *Soil Survey Manual, Handbook 18,* U.S. Government Printing Office, Washington, DC, 1993, p. 138. For the purposes of this Policy, soil shall contain earthen material of particles smaller than 0.08 inches (2 mm) in size.

"Soil Structure" means the arrangement of primary soil particles into compound particles, peds, or clusters that are separated by natural planes of weakness from adjoining aggregates.

"Soil texture" means the soil class that describes the relative amount of sand, clay, silt and combinations thereof as defined by the classes of the soil textural triangle developed by the USDA (referenced above).

"State Water Board" is the State Water Resources Control Board

"Supplemental treatment" means any OWTS or component of an OWTS, except a septic tank or dosing tank, that performs additional wastewater treatment so that the effluent meets the performance requirements prior to discharge of effluent into the dispersal field.

"SWAMP" means Surface Water Ambient Monitoring Program and more information is available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/

"Telemetric" means the ability to automatically measure and transmit OWTS data by wire, radio, or other means.

"TMDL" is the acronym for "total maximum daily load." Section 303(d)(1) of the Clean Water Act requires each State to establish a TMDL for each impaired water body to address the pollutant(s) causing the impairment. In California, TMDLs are usually adopted as Basin Plan amendments and contain implementation plans detailing how water quality standards will be attained.

"Total coliform" means a group of bacteria consisting of several *genera* belonging to the family *Enterobacteriaceae*, which includes Escherichia coli bacteria.

"USDA" means the U.S. Department of Agriculture.

"Waste discharge requirement" or **"WDR"** means an operation and discharge permit issued for the discharge of waste pursuant to Section 13260 of the California Water Code.

Final Draft

Responsibilities and Duties

3/20/2012

Responsibilities and Duties

2.0 OWTS Owners Responsibilities and Duties

2.1 All new, replaced, or existing OWTS within an area that is subject to a Basin Plan prohibition of discharges from OWTS, must comply with the prohibition. If the prohibition authorizes discharges under specified conditions, the discharge must comply with those conditions and the applicable provisions of this Policy.

2.2 Owners of OWTS shall adhere to the requirements prescribed in local codes and ordinances. Owners of new and replaced OWTS shall also meet the minimum standards contained in Tier 1, or an alternate standard provided by a Local Agency Management Program per Tier 2, or shall comply with the requirements of Tier 3 if near an impaired water body and subject to Tier 3, or shall provide corrective action for their OWTS if their system meets conditions that place it in Tier 4.

2.3 Owners of OWTS shall comply with any and all permitting conditions imposed by a local agency implementing its approved Local Agency Management Program per Section 9 of this Policy, including if those conditions are more stringent than required by this Policy.

2.4 To receive coverage under this Policy and the included waiver of waste discharges, OWTS shall only accept and treat flows of domestic wastewater. In addition, OWTS that accept high-strength wastewater from commercial food service buildings are covered under this Policy and the waiver of waste discharge requirements if the wastewater does not exceed 900 mg/L BOD and there is a properly sized and functioning oil/grease interceptor (a.k.a grease trap).

2.5 Owners of OWTS shall maintain their OWTS in good working condition including inspections and pumping of solids as necessary, or as required by local ordinances, to maintain proper function and assure adequate treatment.

2.6 The following owners of OWTS shall notify the Regional Water Board by submitting a Report of Waste Discharge for the following:

2.6.1 a new or replaced OWTS that does not meet the conditions and requirements set forth in this Policy;

2.6.2 a new or replacement OWTS with the projected flow of over 3,500 gallons-per-day where the local permitting authority does not have an approved Local Agency Management Program that includes regulations of flows greater than or equal to the projected flow of the OWTS;

2.6.3 an existing OWTS, not currently under individual waste discharge requirements or a waiver of individual waste discharge requirements issued by a Regional Water Board, with the projected flow of over 10,000 gallons-per-day;

2.6.4 an existing OWTS that will be receiving or has received after the effective date of this Policy a change in the nature of the waste stream from domestic wastewater to high-strength wastewater, unless the waste stream is from a commercial food service building;

2.6.5 a new or replaced OWTS that receives high-strength wastewater, unless the wastewater is from a commercial food service building;

2.6.6 a new, replacement, or existing OWTS that will be or already is receiving high-strength wastewater with: (1) a BOD higher than 900 mg/L from a commercial food service building, or (2) does not have a properly sized and functioning oil/grease interceptor, after the effective date of this Policy.

2.7 All Reports of Waste Discharge shall be accompanied by the required application fee pursuant to California Code of Regulations, title 23, section 2200.

3.0 Local Agency Requirements and Responsibilities

3.1 Local agencies, in addition to implementing their own local codes and ordinances, shall determine whether the requirements within their local jurisdiction will be limited to the water quality protection afforded by the statewide minimum standards in Tier 0, Tier 1, Tier 3, and Tier 4, which this Policy authorizes them to implement, or whether the local agency will implement a Local Agency Management Program in accordance with Tier 2 that provides protection to water quality and public health using standards differing from Tier 1. Except for Tier 3, local agencies may continue to implement their existing OWTS permitting programs in compliance with the Basin Plan in place at the effective date of the Policy and Tier 3 until 60 months after the effective date of this Policy, or approval of a Local Agency Management Program, whichever comes first, and may make minor adjustments as necessary that are in compliance with the applicable Basin Plan and this Policy. Tier 3 requirements take effect on the effective date of this Policy. In the absence of a Tier 2 Local Agency Management Program, to the extent that there is a direct conflict between the applicable minimum standards and the local codes or ordinances (such that it is impossible to comply with both the applicable minimum standards and the local ordinances or codes), the more restrictive standards shall govern.

3.2 If preferred, the local agency may at any time provide the State Water Board and all affected Regional Water Board(s) written notice of its intent to regulate OWTS using a Local Agency Management Program with alternative standards as authorized in Tier 2 of this Policy. A proposed Local Agency Management Program that conforms to the requirements of that Section shall be included with the notice. A local agency shall not implement a program different than the minimum standards contained in Tier 1 and 3 of this Policy after 60 months from the effective date of this Policy until approval of the proposed Local Agency Management Program is granted by either the Regional Water Board or State Water Board. All initial program submittals desiring approval prior to the 60 month limit shall be received no later than 36 months from the effective date of this Policy. Once approved, the local agency shall adhere to the Local Agency Management Program, including all requirements, monitoring, and reporting. If at any time a local agency wishes to modify its Local Agency Management Program, it shall provide the State Water Board and all affected Regional Water Board(s) written notice of its intended modifications and will continue to implement its existing Local Agency Management Program until the modifications are approved.

3.3 All local agencies permitting OWTS shall report annually to the Regional Water Board(s). If a local agency's jurisdictional area is within the boundary of multiple Regional Water Boards, the local agency shall send a copy of the annual report to each Regional Water Board. The annual report shall include the following information (organized in a tabular spreadsheet format) and summarize whether any further actions are warranted to protect water quality or public health:

3.3.1 number and location of complaints pertaining to OWTS operation and maintenance, and identification of those which were investigated and how they were resolved;

3.3.2 shall provide the applications and registrations issued as part of the local septic tank cleaning registration program pursuant to Section 117400 et seq. of the California Health and Safety Code;

3.3.3 number, location, and description of permits issued for new and repaired OWTS and which Tier the permit is issued.

3.4 All local agencies permitting OWTS shall retain permanent records of their permitting actions and will make those records available within 10 working days upon written request for review by a Regional Water Board. The records for each permit shall reference the Tier under which the permit was issued.

3.5 A local agency shall notify the owner of a public well or water intake and the California Department of Public Health as soon as practicable, but not later than 72 hours, upon its discovery of a failing OWTS as described in sections 11.1 and 11.2 within the setbacks described in sections 7.5.6 through 7.5.10.

3.6 A local agency may implement this Policy, or a portion thereof, using its local authority to enforce the policy, as authorized by an approval from the State Water Board or by the appropriate Regional Water Board.

3.7 Nothing in the Policy shall preclude a local agency from adopting or retaining standards for OWTS in an approved Local Agency Management Program that are more protective of the public health or the environment than are contained in this Policy.

3.8 If at any time a local agency wishes to withdraw its previously submitted and approved Tier 2 Local Agency Management Program, it may do so upon 60 days written notice. The notice of withdrawal shall specify the reason for withdrawing its Tier 2 program, the effective date for cessation of the program and resumption of permitting of OWTS only under Tiers 1, 3, and 4.

4.0 Regional Water Board Functions and Duties

4.1 The Regional Water Boards have the principal responsibility for overseeing the implementation of this Policy.

4.2 Regional Water Boards shall incorporate the requirements established in this Policy by amending their Basin Plans within 12 months of the effective date of this Policy, pursuant to Water Code Section 13291(e). The Regional Water Boards may also consider whether it is necessary and appropriate to retain or adopt any more protective standards. To the extent that a Regional Water Board determines that it is necessary and appropriate to retain or adopt any more protective standards, it shall reconcile those region-specific standards with this Policy to the extent feasible, and shall provide a detailed basis for its determination that each of the more protective standards is necessary and appropriate.

4.2.1 Notwithstanding 4.2 above, the North Coast Regional Water Board will continue to implement its existing Basin Plan requirements pertaining to OWTS within the Russian River watershed until it adopts the Russian River TMDL, at which time it will comply with section 4.2 for the Russian River watershed.

4.3 The Regional Water Board designated in Attachment 3 shall review, and if appropriate, approve a Local Agency Management Program submitted by the local agency pursuant to Tier 2 in this Policy. Upon receipt of a proposed Local Agency Management Program, the Regional Water Board designated in Attachment 3 shall have 90 days to notify the local agency whether the submittal contains all the elements of a Tier 2 program, but may request additional information based on review of the proposed program. Approval must follow a noticed hearing with opportunity for public comment. If a Local Agency Management Program is disapproved, the Regional Water Board designated in Attachment 3 shall provide a written explanation of the reasons for the disapproval. A Regional Water Board may approve a Local Agency Management Program while disapproving any proposed special provisions for impaired water bodies contained in the Local Agency Management Program. If no action is taken by the respective Regional Water Board within 12 months of the submission date of a complete Local Agency Management Program, the program shall be forwarded to the State Water Board for review and approval pursuant to Section 5 of this Policy.

4.3.1 Where the local agency's jurisdiction lies within more than one Regional Water Board, staff from the affected Regional Water Boards shall work cooperatively to assure that water quality protection in each region is adequately protected. If the Regional Water Board designated in Attachment 3 approves the Local Agency Management Program over the written objection of an affected Regional Water Board, that Regional Water Board may submit the dispute to the State Water Board under Section 5.3.

4.3.2 Within 30 days of receipt of a proposed Local Agency Management Program, a Regional Water Board will forward a copy to and solicit comments from the California Department of Public Health regarding a Local Agency Management Programs' proposed procedures for notifying local water purveyors prior to OWTS permitting.

4.4 Once a Local Agency Management Program has been approved, any affected Regional Water Board may require modifications or revoke authorization of a local agency to implement a Tier 2 program, in accordance with the following:

4.4.1 The Regional Water Board shall consult with any other Regional Water Board(s) having jurisdiction over the local agency before providing the notice described in section 4.4.2.

4.4.2 Written notice shall be provided to the local agency detailing the Regional Water Board's action, the cause for such action, remedies to prevent the action from continuing to completion, and appeal process and rights. The local agency shall have 90 days from the date of the written notice to respond with a corrective action plan to address the areas of non-compliance, or to request the Regional Water Board to reconsider its findings.

4.4.3 The Regional Water Board shall approve, approve conditionally, or deny a corrective action plan within 90 days of receipt. The local agency will have 90 days to begin implementation of a corrective action plan from the date of approval or 60 days to request reconsideration from the date of denial. If the local agency fails to submit an acceptable corrective action plan, fails to implement an approved corrective action plan, or request reconsideration, the Regional Water Board may require modifications to the Local Agency Management Program, or may revoke the local agency's authorization to implement a Tier 2 program.

4.4.4 Requests for reconsideration by the local agency shall be decided by the Regional Water Board within 90 days and the previously approved Local Agency Management Program shall remain in effect while the reconsideration is pending.

4.4.5 If the request for reconsideration is denied, the local agency may appeal to the State Water Board and the previously approved Local Agency Management Program shall remain in effect while the appeal is under consideration. The State Water Board shall decide the appeal within 90 days. All decisions of the State Water Board are final.

4.5 The appropriate Regional Water Board shall accept and consider any requests for modification or revocation of a Local Agency Management Program submitted by any person. The Regional Water Board will notify the person making the request and the local agency implementing the Local Agency Management Program at issue by letter within 90 days whether it intends to proceed with the modification or revocation process per Section 4.4 above, or is dismissing the request. The Regional Water Board will post the request and its response letter on its website.

4.6 A Regional Water Board may issue or deny waste discharge requirements or waivers of waste discharge requirements for any new or replaced OWTS within a jurisdiction of a local agency without an approved Local Agency Management Program if that OWTS does not meet the minimum standards contained in Tier 1.

4.7 The Regional Water Boards will implement any notifications and enforcement requirements for OWTS determined to be in Tier 3 of this Policy.

4.8 Regional Water Boards may adopt waste discharge requirements, or conditional waivers of waste discharge requirements, that exempt individual OWTS from requirements contained in this Policy.

5.0 State Water Board Functions and Duties

5.1 As the state agency charged with the development and adoption of this Policy, the State Water Board shall periodically review, amend and/or update this Policy as required.

5.2 The State Water Board may take any action assigned to the Regional Water Boards in this Policy.

5.3 The State Water Board shall resolve disputes between Regional Water Boards and local agencies as needed within 12 months of receiving such a request by a Regional Water Board or local agency, and may take action on its own motion in furtherance of this Policy. As part of this function, the State Water Board shall review and, if appropriate, approve Local Agency Management Programs in cases where the respective Regional Water Board has failed to consider for approval a Local Agency Management Program. The State Water Board shall approve Local Agency Management Programs at a regularly noticed board hearing and shall provide for public participation, including notice and opportunity for public comment. Once taken up by the State Water Board, Local Agency Management Programs shall be approved or denied within 180 days.

5.4 A member of the public may request the State Water Board to resolve any dispute regarding the Regional Water Board's approval of a Local Agency Management Program if the member of the public timely raised the disputed issue before the Regional Water Board. Such requests shall be submitted within 30 days after the Regional Water Board's approval of the Local Agency Management Program. The State Water Board shall notify the member of the public, the local agency, and the Regional Water Board within 90 days whether it intends to proceed with dispute resolution.

5.5 The State Water Board shall accept and consider any requests for modification or revocation of a Local Agency Management Program submitted by any person, where that person has previously submitted said request to the Regional Water Board and has received notice from the Regional Water Board of its dismissal of the request. The State Water Board will notify the person making the request and the local agency implementing the Local Agency Management Program at issue by letter within 90 days whether it intends to proceed with the modification or revocation process per Section 4.4 above, or is dismissing the request. The State Water Board will post the request and its response letter on its website.

5.6 The State Water Board, at the time of approving any Impaired Water Bodies [303 (d)] List, and for the purpose of implementing Tier 3 of this Policy, shall identify in Attachment 2 those water bodies where: (1) it is likely that operating OWTS will subsequently be determined to be a contributing source of pathogens or nitrogen and therefore it is anticipated that OWTS would receive a loading reduction, and (2) it is likely that new OWTS installations discharging within 600 feet of the water body would contribute to the impairment. This identification shall be based on information available at the time of 303 (d) listing and may be updated based on new information.

5.7 The State Water Board will make available to local agencies funds from its Clean Water State Revolving Fund loan program for mini-loan programs to be operated by the local agencies for the making of low interest loans to assist private property owners with complying with this Policy.

Tier 0 – Existing OWTS

Existing OWTS that are properly functioning and do not meet the conditions of failing systems or otherwise require corrective action (for example, to prevent groundwater impairment) as specifically described in Tier 4, and are not determined to be contributing to an impairment of surface water as specifically described in Tier 3, are automatically included in Tier 0.

6.0 Coverage for Properly Operating Existing OWTS

6.1 Existing OWTS are automatically covered by Tier 0 and the herein included waiver of waste discharge requirements if they meet the following requirements:

6.1.1 have a projected flow of 10,000 gallons-per-day or less;

6.1.2 receive only domestic wastewater from residential or commercial buildings, or high-strength wastewater from commercial food service buildings that does not exceed 900 mg/L BOD and has a properly sized and functioning oil/grease interceptor (a.k.a. grease trap);

6.1.3 do not require supplemental treatment under Tier 3;

6.1.4 do not require corrective action under Tier 4; and

6.1.5 do not consist of a cesspool as a means of wastewater disposal.

6.2 A Regional Water Board or local agency may deny coverage under this Policy to any OWTS that is:

6.2.1 Not in compliance with Section 6.1;

6.2.2 In the opinion of the Regional Water Board not able to adequately protect the water quality of the waters of the State and should therefore submit a report of waste discharge to receive Region specific waste discharge requirements or waiver of waste discharge requirements so as to be protective.

6.3 Existing OWTS currently under waste discharge requirements or individual waiver of waste discharge requirements will remain under those orders until notified in writing by the appropriate Regional Water Board that they are covered under this Policy.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

Tier 1 – Low Risk New or Replacement OWTS

New or replacement OWTS meet low risk siting and design requirements as specified in Tier 1, where there is not an approved Local Agency Management Program per Tier 2.

7.0 Minimum Site Evaluation and Siting Standards

7.1 A qualified professional shall perform all necessary soil and site evaluations for all new OWTS and for existing OWTS where the treatment or dispersal system will be replaced or expanded.

7.2 A site evaluation shall determine that adequate soil depth is present in the dispersal area. Soil depth is measured vertically to the point where bedrock, hardpan, impermeable soils, or saturated soils are encountered or an adequate depth has been determined. Soil depth shall be determined through the use of soil profile(s) in the dispersal area and the designated dispersal system replacement area, as viewed in excavations exposing the soil profiles in representative areas, unless the local agency has determined through historical or regional information that a specific site soil profile evaluation is unwarranted.

7.3 A site evaluation shall determine the anticipated highest level of groundwater within the dispersal field and its required minimum dispersal zone by estimation using one or a combination of the following methods:

7.3.1 Direct observation of the highest extent of soil mottling observed in the examination of soil profiles, recognizing that soil mottling is not always an indicator of the uppermost extent of high groundwater; or

7.3.2 Direct observation of groundwater levels during the anticipated period of high groundwater. Methods for groundwater monitoring and determinations shall be decided by the local agency; or

7.3.3 Other methods, such as historical records, acceptable to the local agency.

7.3.4 Where a conflict in the above methods of examination exists, the direct observation method indicating the highest level shall govern.

7.4 Percolation test results in the effluent disposal area shall not be faster than one minute per inch (1 MPI) or slower than ninety minutes per inch (90 MPI). Other percolation rates may be used under a Tier 2 Local Agency Management Program. All percolation rates shall be based on actual or simulated wet weather conditions by performing the test during the wet weather period as determined by the local agency or by presoaking of percolation test holes and shall be a stabilized rate.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

7.5 Minimum horizontal setbacks shall be as follows:

7.5.1 5 feet from parcel property lines;

7.5.2 100 feet from water wells and monitoring wells, unless regulatory or legitimate data requirements necessitate that monitoring wells be located closer;

7.5.3 100 feet from any unstable land mass or any areas subject to earth slides identified by a registered engineer or registered geologist; other setback distance are allowed, if recommended by a geotechnical report prepared by a qualified professional.

7.5.4 100 feet from springs and flowing surface water bodies where the edge of that water body is the natural or levied bank for creeks and rivers, or may be less where site conditions prevent migration of wastewater to the water body;

7.5.5 200 feet from vernal pools, wetlands, lakes, ponds, or other surface water bodies where the edge of that water body is the high water mark for lakes and reservoirs, and the mean high tide line for tidally influenced water bodies;

7.5.6 150 feet from a public water well where the depth of the effluent dispersal system does not exceed 10 feet;

7.5.7 200 feet from a public water well where the depth of the effluent dispersal system exceeds 10 feet in depth;

7.5.8 Where the effluent dispersal system is within 600 feet of a public water well and exceeds 20 feet in depth and the separation from the bottom of the system and ground water is less than five feet, the horizontal setback required to achieve a two-year travel time for microbiological contaminants shall be evaluated. A qualified professional shall conduct this evaluation. However in no case shall the setback be less than 200 feet.

7.5.9 Where the effluent dispersal system is within 1,200 feet from a public water systems' surface water intake and within the catchment of the drainage, the dispersal system shall be no less than 400 feet from the high water mark of the reservoir, lake or flowing water body.

7.5.10 Where the effluent dispersal system is located more than 1,200 but less than 2,500 feet from a public water systems' surface water intake and within the catchment of the drainage, the dispersal system shall be no less than 200 feet from the high water mark of the reservoir, lake or flowing water body.

7.6 Prior to issuing a permit to install an OWTS the permitting agency shall determine if the OWTS is within 1,200 feet of an intake for a surface water treatment plant for drinking water and is in the drainage catchment in which the intake is located. If the OWTS is within 1,200 feet of an intake for a surface water treatment plant for drinking water and is in the drainage catchment in which the intake is located:

7.6.1 The permitting agency shall provide a copy of the permit application to the owner of the water system of their proposal to install an OWTS within 1,200 of an intake for a surface water treatment. If the owner of the water system cannot be identified, then the permitting agency will notify California Department of Public Health Drinking Water Program.

7.6.2 The permit application shall include a topographical plot plan for the parcel showing the OWTS components, the property boundaries, proposed structures, physical address, and name of property owner.

7.6.3 The permitting agency shall provide the estimated wastewater flows, intended use of proposed structure generating the wastewater, soil data, and estimated depth to seasonally saturated soils.

7.6.4 The public water system owner shall have 5 days from receipt of the permit application to provide recommendations and comments to the permitting agency.

7.7 Natural ground slope in all areas used for effluent disposal shall not be greater than 25 percent.

7.8 The average density for any subdivision of property occurring after the effective date of this Policy and implemented under Tier 1 shall not exceed one single-family dwelling unit, or its equivalent, per 2.5 acres for those units that rely on OWTS.

8.0 Minimum OWTS Design and Construction Standards

8.1 OWTS Design Requirements

8.1.1 A qualified professional shall design all new OWTS and modifications to existing OWTS where the treatment or dispersal system will be replaced or expanded. A qualified professional employed by a local agency, while acting in that capacity may design or review and approve a design for a proposed OWTS.

8.1.2 OWTS shall be located, designed, and constructed in a manner to ensure that effluent does not surface at any time, and that percolation of effluent will not adversely affect beneficial uses of waters of the State.

8.1.3 The design of new and replaced OWTS shall be based on the expected influent wastewater quality with a projected flow not to exceed 3,500 gallons per day, the peak wastewater quantity for purposes of hydraulic sizing, the characteristics of the site, and the required level of treatment for protection of water quality and public health.

8.1.4 All dispersal systems shall have at least twelve (12) inches of soil cover.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

8.1.5 The minimum depth to the anticipated highest level of groundwater below the bottom of the leaching trench, and the native soil depth immediately below the leaching trench, shall not be less than prescribed in Table 1.

Table 1: Tier 1 Minimum Depths to Groundwater and Minimum Soil Depth from the Bottom of the Dispersal System

Percolation Rate	Depth to groundwater
Percolation Rate ≤1 MPI	Only as authorized in a Tier 2 Local Agency Management Program
1 MPI< Percolation Rate ≤ 5 MPI	Twenty (20) feet
5 MPI< Percolation Rate ≤ 30 MPI	Eight (8) feet
30 MPI< Percolation Rate ≤ 90 MPI	Five (5) feet
Percolation Rate > 90 MPI	Only as authorized in a Tier 2 Local Agency Management Program

MPI = minutes per inch

8.1.6 Dispersal systems shall be a leachfield, designed using not more than 4 square-feet of infiltrative area per linear foot of trench as the infiltrative surface, and with trench width no wider than 3 feet. Seepage pits and other dispersal systems may only be authorized for repairs where siting limitations require a variance. Maximum application rates shall be determined from stabilized percolation rate as provided in Table 2, or from soil texture and structure determination as provided in Table 3.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

[1] Soils listed as prohibited may be allowed under the authority of the Regional Water Board ,or as allowed under an approved Local Agency Management Program per Tier 2.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

8.1.7 Dispersal systems shall not exceed a maximum depth of 10 feet as measured from the ground surface to the bottom of the trench.

8.1.8 All new dispersal systems shall have 100 percent replacement area that is equivalent and separate, and available for future use.

8.1.9 No dispersal systems or replacement areas shall be covered by an impermeable surface, such as paving, building foundation slabs, plastic sheeting, or any other material that prevents oxygen transfer to the soil.

8.1.10 Rock fragment content of native soil surrounding the dispersal system shall not exceed 50 percent by volume for rock fragments sized as cobbles or larger and shall be estimated using either the point-count or line-intercept methods.

8.1.11 Increased allowance for gravel-less chamber systems is only allowed under a Tier 2 Local Agency Management Program.

8.2 Septic Tank Construction and Installation

8.2.1 All new or replaced septic tanks and new or replaced grease interceptor tanks shall comply with the standards contained in Sections K5(b), K5(c), K5(d), K5(e), K5(k), K5(m)(1), and K5(m)(3)(ii) of Appendix K, of Part 5, Title 24 of the 2007 California Code of Regulations.

8.2.2 All new septic tanks shall comply with the following requirements:

8.2.2.1 Access openings shall have watertight risers, the tops of which shall be set within 6 inches of finished grade; and

8.2.2.2 Access openings shall be secured to prevent unauthorized access.

8.2.3 New and replaced OWTS septic tanks shall be limited to those approved by the International Association of Plumbing and Mechanical Officials (IAPMO) or stamped and certified by a California registered civil engineer as meeting the industry standards, and their installation shall be according to the manufacturer's instructions.

8.2.4 New and replaced OWTS septic tanks shall be designed to prevent solids in excess of three-sixteenths (3/16) of an inch in diameter from passing to the dispersal system. Septic tanks that use a National Sanitation Foundation/American National Standard Institute (NSF/ANSI) Standard 46 certified septic tank filter at the final point of effluent discharge from the OWTS and prior to the dispersal system shall be deemed in compliance with this requirement.

Final Draft

Tier 1 – Low Risk New or Replacement OWTS

3/20/2012

8.2.5 A Licensed General Engineering Contractor (Class A), General Building Contractor (Class B), Sanitation System Contractor (Specialty Class C-42), or Plumbing Contractor (Specialty Class C-36) shall install all new OWTS and replaced OWTS in accordance with California Business and Professions Code Sections 7056, 7057, and 7058 and Article 3, Division 8, Title 16 of the California Code of Regulations. A property owner may also install his/her own OWTS if the as-built diagram and the installation are inspected and approved by the Regional Water Board or local agency at a time when the OWTS is in an open condition (not covered by soil and exposed for inspection).

Final Draft

Tier 2 – Local Agency OWTS Management Program

3/20/2012

Tier 2 – Local Agency OWTS Management Program

Local agencies may submit management programs for approval, and upon approval then manage the installation of new and replacement OWTS under that program. Local Agency Management Programs approved under Tier 2 provide an alternate method from Tier 1 programs to achieve the same policy purpose, which is to protect water quality and public health. In order to address local conditions, Local Agency Management Programs may include standards that differ from the Tier 1 requirements for new and replacement OWTS contained in Sections 7 and 8. As examples, a Local Agency Management Program may authorize different soil characteristics, usage of seepage pits, and different densities for new developments. Once the Local Agency Management Program is approved, new and replacement OWTS that are included within the Local Agency Management Program may be approved by the Local Agency. A Local Agency, at its discretion, may include Tier 1 standards within its Tier 2 Local Agency Management Program for some or all of its jurisdiction. However, once a Local Agency Management Program is approved, it shall supersede Tier 1 and all future OWTS decisions will be governed by the Tier 2 Local Agency Management Program until it is modified, withdrawn, or revoked.

9.0 Local Agency Management Program for Minimum OWTS Standards

The Local Agency Management Program for minimum OWTS Standards is a management program where local agencies can establish minimum standards that are differing requirements from those specified in Tier 1 (Section 7 and Section 8), including the areas that cannot meet those minimum standards and still achieve this Policy's purpose, which is to protect water quality and public health. Local Agency Management Programs may include any one or combination of the following to achieve this purpose:

- Differing system design requirements;
- Differing siting controls such as system density and setback requirements;
- Requirements for owners to enter monitoring and maintenance agreements; and/or
- Creation of an onsite management district.

9.1 Where different and/or additional requirements are needed to protect water quality the local agency may consider any of the following, as well as any other conditions deemed appropriate, when developing Local Agency Management Program requirements:

9.1.1 Degree of vulnerability to pollution from OWTS due to hydrogeological conditions.

9.1.2 High Quality waters or other environmental conditions requiring enhanced protection from the effects of OWTS.

9.1.3 Shallow soils requiring a dispersal system installation that is closer to ground surface than is standard.

9.1.4 OWTS is located in area with high domestic well usage.

9.1.5 Dispersal system is located in an area with fractured bedrock.

9.1.6 Dispersal system is located in an area with poorly drained soils.

9.1.7 Surface water is vulnerable to pollution from OWTS.

9.1.8 Surface water within the watershed is listed as impaired for nitrogen or pathogens.

9.1.9 OWTS is located within an area of high OWTS density.

9.2 The Local Agency Management Program shall detail the scope of its coverage, such as the maximum authorized projected flows for OWTS, as well as a clear delineation of those types of OWTS included within and to be permitted by the program, and provide the local site evaluation, siting, design, and construction requirements, and in addition each of the following:

9.2.1 Any local agency requirements for onsite wastewater system inspection, monitoring, maintenance, and repairs, including procedures to ensure that replacements or repairs to failing systems are done under permit from the local governing jurisdiction.

9.2.2 Any special provisions applicable to OWTS within specified geographic area near specific impaired water bodies listed for pathogens or nitrogen. The special provisions may be substantive and/or procedural, and may include, as examples: consultation with the Regional Water Board prior to issuing permits, supplemental treatment, development of a management district, special siting requirements, additional inspection and monitoring.

9.2.3 Local Agency Management Program variances, for new installations and repairs in substantial conformance, to the greatest extent practicable. Variances are not allowed for the requirements stated in sections 9.4.1 through 9.4.9.

9.2.4 Any educational, training, certification, and/or licensing requirements that will be required of OWTS service providers, site evaluators, designers, installers, pumpers, maintenance contractors, and any other person relating to OWTS activities.

9.2.5 Education and/or outreach program including informational materials to inform OWTS owners about how to locate, operate, and maintain their OWTS as well as any Water Board order (e.g., Basin Plan prohibitions) regarding OWTS restrictions within its jurisdiction. The education and/or outreach program shall also include procedures to ensure that alternative onsite system owners are provided an informational maintenance or replacement document by the system designer or installer. This document shall cite homeowner procedures to ensure maintenance, repair, or replacement of critical items within 48 hours following failure.

9.2.6 An analysis of existing and proposed disposal locations for septage, the volume of septage anticipated, and whether adequate capacity is available.

9.2.7 Any consideration given to onsite maintenance districts.

9.2.8 Any consideration given to the development and implementation of, or coordination with, Regional Salt and Nutrient Management Plans.

9.2.9 Any consideration given to coordination with watershed management groups.

9.2.10 Procedures for evaluating the proximity of sewer systems to new or replacement OWTS installations.

9.2.11 Procedures for notifying the owner of a public water system prior to issuing an installation or repair permit for an OWTS, if the OWTS is within 1,200 feet of an intake for a surface water treatment plant for drinking water and is in the drainage area catchment in which the intake is located, or if the OWTS is within a horizontal sanitary setback from a public well.

9.2.12 Policies and procedures that will be followed when a proposed OWTS dispersal area is within the horizontal sanitary setback of a public well or a surface water intake. These policies and procedures shall either indicate that supplemental treatment as specified in 10.9 and 10.10 of this policy are required for OWTS that are within a horizontal sanitary setback of a public well or surface water intake, or will establish alternate siting and operational criteria for the proposed OWTS that would similarly mitigate the potential adverse impact to the public water source.

9.3 The minimum responsibilities of the local agency for management of the Local Agency Management Program include:

9.3.1 Maintain records of the number, location, and description of permits issued for OWTS where a variance is granted.

9.3.2 Maintain a water quality assessment program to evaluate the impact of OWTS discharges and assess the extent to which groundwater and local surface water quality may be adversely impacted. The focus of the assessment should be areas with characteristics listed under section 9.1. The assessment program will include monitoring and analysis of water quality data, review of complaints, variances, failures, and any information resulting from inspections. The assessment may use existing water quality data from other monitoring programs and/or establish the terms, conditions, and timing for monitoring done by the local agency. At a minimum this assessment will include monitoring data for nitrates and pathogens, and may include data for other constituents which are needed to adequately characterize the impacts of OWTS on water quality. Other monitoring programs for which data may be used include but are not limited to any of the following:

9.3.2.1. Random well samples from a domestic well sampling program.

9.3.2.2. Routine real estate transfer samples if those are performed and reported.

9.3.2.3. Review of public system sampling reports done by the local agency or another municipality responsible for the public system.

9.3.2.4. Water quality testing reports done at the time of new well development if those are reported.

9.3.2.5. Beach water quality testing data performed as part of Health and Safety Code Section 115885.

9.3.2.6. Receiving water sampling performed as a part of a NPDES permit.

9.3.2.7. Data contained in the California Water Quality Assessment Database.

9.3.2.8. Groundwater sampling performed as part of Waste Discharge Requirements.

9.3.2.9. Groundwater data collected as part of the Groundwater Ambient Monitoring and Assessment Program and available in the Geotracker Database.

9.3.3 Submit an annual report by February 1 to the applicable Regional Water Board summarizing the status of items 9.3.1 through 9.3.2 above. Every fifth year, submit an evaluation of the monitoring program and an assessment of whether water quality is being impacted by OWTS, identifying any changes in the Local Agency Management Program that will be undertaken to address impacts from OWTS. The first report will commence one year after approval of the local agency’s Local Agency Management Program. In addition to summarizing monitoring data collected per 9.3.8 above, all groundwater monitoring data generated by the local agency shall be submitted in EDF format for inclusion into Geotracker, and surface water monitoring shall be submitted to CEDEN in a SWAMP comparable format.

9.4 The following are not allowed to be included in a Local Agency Management Program:

9.4.1 Cesspools of any kind or size.

9.4.2 OWTS receiving a projected flow over 10,000 gallons per day.

9.4.3 OWTS that utilize any form of effluent disposal that discharges on or above the post installation ground surface such as sprinklers, exposed drip lines, free-surface wetlands, or a pond.

9.4.4 Slopes greater than 30 percent without a slope stability report approved by a registered professional.

9.4.5 Decreased leaching area for IAPMO-approved dispersal systems using a multiplier less than 0.70.

9.4.6 Supplemental OWTS without requirements for periodic monitoring or inspections.

9.4.7 OWTS dedicated to receiving wastes from RV dumps.

9.4.8 Separation of the bottom of dispersal system to groundwater less than two (2) feet.

9.4.9 Installation of OWTS where public sewer is available. The public sewer may be considered as not available when such public sewer or any building or exterior drainage facility connected thereto is located more than 200 feet from any proposed building or exterior drainage facility on any lot or premises that abuts and is served by such public sewer.

9.4.10 Except as provided for in sections 9.4.11 and 9.4.12, new or repaired onsite systems with minimum horizontal setbacks less than any of the following:

9.4.10.1 150 feet from a public water well where the depth of the effluent dispersal system does not exceed 10 feet in depth.

9.4.10.2 200 feet from a public water well where the depth of the effluent dispersal system exceeds 10 feet in depth.

9.4.10.3 Where the effluent dispersal system is within 600 feet of a public water well and exceeds 20 feet in depth and the separation from the bottom of the system and ground water is less than five feet the horizontal setback required to achieve a two-year travel time for microbiological contaminants shall be evaluated. A qualified professional shall conduct this evaluation. However in no case shall the setback be less than 200 feet.

9.4.10.4 Where the effluent dispersal system is within 1,200 feet from a public water systems' surface water intake and within the catchment of the drainage, the dispersal system shall be no less than 400 feet from the high water mark of the reservoir, lake or flowing water body.

9.4.10.5 Where the effluent dispersal system is located more than 1,200 but less than 2,500 feet from a public water systems' surface water intake and within the catchment area of the drainage, the dispersal system shall be no less than 200 feet from the high water mark of the reservoir, lake or flowing water body.

9.4.11 For replacement OWTS that do not meet the above horizontal separation requirements, the replacement OWTS shall meet the horizontal separation to the greatest extent practicable. In such case, the replacement OWTS shall utilize supplemental treatment and other mitigation measures, unless the permitting authority finds that there is no indication that the existing system is adversely affecting the public water source, and there is limited potential that the system could impact the water source based on topography, soil depth, soil texture, and groundwater separation.

9.4.12 For new OWTS, installed on parcels of record existing at the time of the effective date of this Policy, that cannot meet the above horizontal separation requirements, the OWTS shall meet the horizontal separation to the greatest extent practicable and shall utilize supplemental treatment for pathogens as specified in section 10.8 and any other mitigation measures prescribed by the permitting authority.

9.5 A Local Agency Management Program for OWTS must include adequate technical detail to support how all the criteria in their program work together to protect water quality and public health.

9.6 A Regional Water Board reviewing a Local Agency Management Program shall consider, among other things, the past performance of the local program to adequately protect water quality, and where this has been achieved with criteria differing from Tier 1, shall not unnecessarily require modifications to the program for purposes of uniformity, as long as the Local Agency Management Program meets the requirements of Tier 2.

Final Draft

Tier 3 – Impaired Areas

3/20/2012

Tier 3 – Impaired Areas

OWTS that are near impaired water bodes may be addressed by a TMDL and its implementation program, or special provisions contained in a Local Agency Management Program. If there is no TMDL or special provisions, new or replacement OWTS within 600 feet of impaired water bodies listed in Attachment 2 must meet the specific requirements of Tier 3.

10.0 Advanced Protection Management Program

The Advanced Protection Management Program is the minimum required management program for all local agencies where an OWTS is located near a water body that has been listed as an impaired water body due to nitrogen or pathogen indicators pursuant to Section 303(d) of the Clean Water Act. This Tier 3 contains the OWTS requirements within the Advanced Protection Management Program. Local agencies are authorized to implement Advanced Protection Management Programs in conjunction with an approved Local Agency Management Program or, if there is no approved Local Agency Management Program, Tier 1. Local agencies are encouraged to collaborate with the Regional Water Boards by sharing any information pertaining to the impairment, provide advice on potential remedies, and regulate OWTS to the extent that their authority allows for the improvement of the impairment.

10.1 The geographic area for each water body's Advanced Protection Management Program is defined by the applicable TMDL, if one has been approved. If there is not an approved TMDL, it is defined by an approved Local Agency Management Program, if it contains special provisions for that water body. If it is not defined in an approved TMDL or Local Agency Management Program, it shall be 600 linear feet [in the horizontal (map) direction] of a water body listed in Attachment 2 where the edge of that water body is the natural or levied bank for creeks and rivers, the high water mark for lakes and reservoirs, and the mean high tide line for tidally influenced water bodies, as appropriate. OWTS near impaired water bodies that are not listed on Attachment 2, and do not have a TMDL and are not covered by a Local Agency Management Program with special provisions, are not addressed by Tier 3.

10.2 The requirements of an Advanced Protection Management Program for all OWTS will be in accordance with an adopted TMDL, and its implementation program, if one has been adopted to address the impairment. An adopted TMDL supersedes all requirements in Tier 3, except that, for TMDL implementation plans adopted after the effective date of this Policy, all required OWTS implementation actions shall commence within 5 years after the TMDL's effective date. The TMDL may use some or all of the Tier 3 requirements and shall establish the applicable area of implementation for OWTS requirements within the watershed. For those impaired water bodies that do have an adopted TMDL addressing the impairment, but the TMDL does not assign a load allocation to OWTS, no further action is required unless the TMDL is modified at some point in the future to include actions for OWTS.

10.3 If no TMDL has been adopted, the requirements of an Advanced Protection Management Program for all OWTS will be in accordance with the Local Agency Management Program, if any special provisions for the water body have been approved.

10.4 The Regional Water Boards shall adopt TMDLs for impaired water bodies identified in Attachment 2, in accordance with the specified dates.

10.4.1 If a Regional Water Board does not complete a TMDL within two years of the time period specified in Attachment 2, coverage under this Policy's waiver of waste discharge requirements shall expire for any OWTS that has any part of its dispersal system discharging within the geographic area of an Advanced Protection Management Program. The Regional Water Board shall issue waste discharge requirements, general waste discharge requirements, waivers of waste discharge requirements, or require corrective action for such OWTS. The Regional Water Board will consider the following when establishing the waste discharge requirements, general waste discharge requirements, waivers of waste discharge requirements, or requirement for corrective action:

10.4.1.1 Whether supplemental treatment should be required.

10.4.1.2 Whether routine inspection of the OWTS should be required.

10.4.1.3 Whether monitoring of surface and groundwater should be performed.

10.4.1.4 The collection of a fee for those OWTS covered by the order.

10.4.1.5 Whether owners of previously-constructed OWTS should file a report by a qualified professional in accordance with section 10.5.

10.4.1.6 Whether owners of new or replaced OWTS should file a report of waste discharge with additional supporting technical information as required by the Regional Water Board.

10.5 If the Regional Water Board requires owners of OWTS to submit a qualified professional's report, the report may include a determination of whether the OWTS is functioning properly and as designed or requires corrective actions per Tier 4, and regardless of its state of function, whether it is contributing to impairment of the water body.

10.5.1 The qualified professional's report may also include, but is not limited to:

10.5.1.1 A general description of system components, their physical layout, and horizontal setback distances from property lines, buildings, wells, and surface waters.

Final Draft

Tier 3 – Impaired Areas

3/20/2012

10.5.1.2 A description of the type of wastewater discharged to the OWTS such as domestic, commercial, or industrial and classification of it as domestic wastewater or high-strength waste.

10.5.1.3 A determination of the systems design flow and the volume of wastewater discharged daily derived from water use, either estimated or actual if metered.

10.5.1.4 A description of the septic tank, including age, size, material of construction, internal and external condition, water level, scum layer thickness, depth of solids, and the results of a one-hour hydrostatic test.

10.5.1.5 A description of the distribution box, dosing siphon, or distribution pump, and if flow is being equally distributed throughout the dispersal system, as well as any evidence of solids carryover, clear water infiltration, or evidence of system backup.

10.5.1.6 A description of the dispersal system including signs of hydraulic failure, condition of surface vegetation over the dispersal system, level of ponding above the infiltrative surface within the dispersal system, other possible sources of hydraulic loading to the dispersal area, and depth of the seasonally high groundwater level.

10.5.1.7 A determination of whether the OWTS is discharging to the ground's surface.

10.5.1.8 For a water body listed as an impaired water body for pathogens, a determination of the OWTS dispersal system's separation from its deepest most infiltrative surface to the highest seasonal groundwater level or fractured bedrock.

10.5.1.9 For a water body listed as an impaired water body for nitrogen, a determination of whether the groundwater under the dispersal field is reaching the water body, and a description of the method used to make the determination.

10.6 For new, replaced, and existing OWTS in an Advanced Protection Management Program, the following are not covered by this Policy's waiver but may be authorized by a separate Regional Water Board order:

10.6.1 Cesspools of any kind or size.

10.6.2 OWTS receiving a projected flow over 10,000 gallons per day.

10.6.3 OWTS that utilize any form of effluent disposal on or above the ground surface.

10.6.4 Slopes greater than 30 percent without a slope stability report approved by a registered professional.

10.6.5 Decreased leaching area for IAPMO-approved dispersal systems using a multiplier less than 0.70.

10.6.6 OWTS utilizing supplemental treatment without requirements for periodic monitoring.

10.6.7 OWTS dedicated to receiving wastes from RV dumps.

10.6.8 Separation of the bottom of dispersal system to groundwater less than two (2) feet.

10.6.9 Minimum horizontal setbacks less than any of the following:

10.6.9.1 150 feet from a public water well where the depth of the effluent dispersal system does not exceed 10 feet in depth;

10.6.9.2 200 feet from a public water well where the depth of the effluent dispersal system exceeds 10 feet in depth:

10.6.9.3 Where the effluent dispersal system is within 600 feet of a public water well and exceeds 20 feet in depth and the separation from the bottom of the system and ground water is less than five feet the horizontal setback required to achieve a two-year travel time for microbiological contaminants shall be evaluated. A qualified professional shall conduct this evaluation. However in no case shall the setback be less than 200 feet.

10.6.9.4 Where the effluent dispersal system is within 1,200 feet from a public water systems' surface water intake and within the catchment of the drainage, the dispersal system shall be no less than 400 feet from the high water mark of the reservoir, lake or flowing water body.

10.6.9.5 Where the effluent dispersal system is located more than 1,200 but less than 2,500 feet from a public water systems' surface water intake and within the catchment of the drainage, the dispersal system shall be no less than 200 feet from the high water mark of the reservoir, lake or flowing water body.

10.6.9.6 For replacement OWTS that do not meet the above horizontal separation requirements, the replacement OWTS shall meet the horizontal separation to the greatest extent practicable. In such case, the replacement OWTS shall utilize supplemental treatment and other mitigation measures.

10.6.9.7 For new OWTS, installed on parcels of record existing at the time of the effective date of this Policy, that cannot meet the above horizontal separation requirements, the OWTS shall meet the horizontal separation to the greatest extent practicable and shall utilize supplemental treatment for pathogens as specified in section

10.8 and any other mitigation measures as prescribed by the permitting authority.

10.7 The requirements contained in Section 10 shall not apply to owners of OWTS that are constructed and operating, or permitted, on or prior to the date that the nearby water body is added to Attachment 2 who commit by way of a legally binding document to connect to a centralized wastewater collection and treatment system regulated through WDRs as specified within the following timeframes:

10.7.1 The owner must sign the document within forty-eight months of the date that the nearby water body is initially listed on Attachment 2.

10.7.2 The specified date for the connection to the centralized community wastewater collection and treatment system shall not extend beyond nine years following the date that the nearby water body is added to Attachment 2.

10.8 In the absence of an adopted TMDL or Local Agency Management Program containing special provisions for the water body, all new or replaced OWTS permitted after the date that the water body is initially listed in Attachment 2 that have any discharge within the geographic area of an Advanced Protection Management Program shall meet the following requirements:

10.8.1 Utilize supplemental treatment and meet performance requirements in 10.9 if impaired for nitrogen and 10.10 if impaired for pathogens,

10.8.2 Comply with the setback requirements of Section 7.5.1 to 7.5.5, and

10.8.3 Comply with any applicable Local Agency Management Program requirements.

10.9 Supplemental treatment requirements for nitrogen

10.9.1 Effluent from the supplemental treatment components designed to reduce nitrogen shall be certified by NSF, or other approved third party tester, to meet a 50 percent reduction in total nitrogen when comparing the 30-day average influent to the 30-day average effluent.

10.9.2 Where a drip-line dispersal system is used to enhance vegetative nitrogen uptake, the dispersal system shall have at least six (6) inches of soil cover.

10.10 Supplemental treatment requirements for pathogens

10.10.1 Supplemental treatment components designed to perform disinfection shall provide sufficient pretreatment of the wastewater so that effluent from the supplemental treatment components does not exceed a 30-day average TSS of 30 mg/L and shall further achieve an effluent fecal coliform bacteria concentration less than or equal to 200 Most Probable Number (MPN) per 100 milliliters.

10.10.2 The minimum soil depth and the minimum depth to the anticipated highest level of groundwater below the bottom of the dispersal system shall not be less than three (3) feet. All dispersal systems shall have at least twelve (12) inches of soil cover.

10.11 OWTS in an Advanced Protection Management Program with supplemental treatment shall be designed to meet the applicable performance requirements above and shall be stamped or approved by a Qualified Professional.

10.12 Prior to the installation of any proprietary treatment OWTS in an Advanced Protection Management Program, all such treatment components shall be tested by an independent third party testing laboratory.

10.13 The ongoing monitoring of OWTS in an Advanced Protection Management Program with supplemental treatment components designed to meet the performance requirements in Sections 10.9 and 10.10 shall be monitored in accordance with the operation and maintenance manual for the OWTS or more frequently as required by the local agency or Regional Water Board.

10.14 OWTS in an Advanced Protection Management Program with supplemental treatment components shall be equipped with a visual or audible alarm as well as a telemetric alarm that alerts the owner and service provider in the event of system malfunction. OWTS using supplemental treatment shall, at a minimum, provide for 24-hour wastewater storage based on design flow as a means to minimize pollution from overflow discharge after a system malfunction or power outage. Where telemetry is not possible, the owner shall inspect the system at least monthly as directed and instructed by a service provider and notify the service provider not less than quarterly of the observed operating parameters of the OWTS.

10.15 OWTS in an Advanced Protection Management Program designed to meet the disinfection requirements in Section 10.10 shall be inspected for proper operation quarterly by a service provider unless a telemetric monitoring system is capable of continuously assessing the operation of the disinfection system. Testing of the wastewater flowing from supplemental treatment components that perform disinfection shall be sampled at a point in the system after the treatment components and prior to the dispersal system and shall be conducted quarterly based on analysis of total coliform with a minimum detection limit of 2.2 MPN. All effluent samples must include the geographic coordinates of the sample's location. Effluent samples shall be taken by a service provider and analyzed by a California Department of Public Health certified laboratory.

10.16 The minimum responsibilities of the local agency administering an Advanced Protection Management Program include those prescribed for the Local Agency Management Programs in Section 9.3 of this policy, as well as monitoring owner compliance with Sections 10.13, 10.14,and 10.15.

Tier 4 – OWTS Requiring Corrective Action

OWTS that require corrective action or are either presently failing or fail at any time while this Policy is in effect are automatically included in Tier 4 and must follow the requirements as specified. OWTS included in Tier 4 must continue to meet applicable requirements of Tier 0, 1, 2 or 3 pending completion of corrective action.

11.0 Corrective Action for OWTS

11.1 Any OWTS that has pooling effluent, discharges wastewater to the surface, or has wastewater backed up into plumbing fixtures, because its dispersal system is no longer adequately percolating the wastewater is deemed to be failing, no longer meeting its primary purpose to protect public health, and requires major repair, and as such the dispersal system must be replaced, repaired, or modified so as to return to proper function and comply with Tier 1, 2, or 3 as appropriate.

11.2 Any OWTS septic tank failure, such as a baffle failure or tank structural integrity failure such that either wastewater is exfiltrating or groundwater is infiltrating is deemed to be failing, no longer meeting its primary purpose to protect public health, and requires major repair, and as such shall require the septic tank to be brought into compliance with the requirements of Section 8 in Tier 1 or a Local Agency Management Program per Tier 2.

11.3 Any OWTS that has a failure of one of its components other than those covered by 11.1 and 11.2 above, such as a distribution box or broken piping connection, shall have that component repaired so as to return the OWTS to a proper functioning condition and return to Tier 0, 1, 2, or 3.

11.4 Any OWTS that has affected, or will affect, groundwater or surface water to a degree that makes it unfit for drinking or other uses, or is causing a human health or other public nuisance condition shall be modified or upgraded so as to abate its impact.

11.5 If the owner of the OWTS is not able to comply with corrective action requirements of this section, the Regional Water Board may authorize repairs that are in substantial conformance, to the greatest extent practicable, with Tiers 1 or 3, or may require the owner of the OWTS to submit a report of waste discharge for evaluation on a case-by-case basis. Regional Water Board response to such reports of waste discharge may include, but is not limited to, enrollment in general waste discharge requirements, issuance of individual waste discharge requirements, or issuance of waiver of waste discharge requirements. A local agency may authorize repairs that are in substantial conformance, to the greatest extent practicable, with Tier 2 in accordance with section 9.2.3 if there is an approved Local Agency Management Program, or with an existing program if a Local Agency

Management Program has not been approved and it is less than 5 years from the effective date of the Policy.

11.6 Owners of OWTS will address any corrective action requirement of Tier 4 as soon as is reasonably possible, and must comply with the time schedule of any corrective action notice received from a local agency or Regional Water Board, to retain coverage under this Policy. In no case shall the time schedule be allowed to extend beyond three months for a corrective action, with the exception of seasonal high groundwater or snow conditions.

11.7 Failure to meet the requirements of Tier 4 constitute a failure to meet the conditions of the waiver of waste discharge requirements contained in this Policy, and is subject to further enforcement action.

Final Draft

Waiver – Effective Date – Financial Assistance

3/20/2012

Conditional Waiver of Waste Discharge Requirements

12.0 In accordance with Water Code section 13269, the State Water Board hereby waives the requirements to submit a report of waste discharge, obtain waste discharge requirements, and pay fees for discharges from OWTS covered by this Policy. Owners of OWTS covered by this Policy shall comply with the following conditions:

12.0.1 The OWTS shall function as designed with no surfacing effluent.

12.0.2 The OWTS shall not utilize a dispersal system that is in soil saturated with groundwater.

12.0.3 The OWTS shall not be operated while inundated by a storm or flood event.

12.0.4 The OWTS shall not cause or contribute to a nuisance or pollution.

12.0.5 The OWTS shall comply with all applicable local agency codes, ordinances, and requirements.

12.0.6 The OWTS shall comply with and meet any applicable TMDL implementation requirements, special provisions for impaired water bodies, or supplemental treatment requirements imposed by Tier 3.

12.0.7 The OWTS shall comply with any corrective action requirements of Tier 4.

12.1 This waiver may be revoked by the State Water Board or the applicable Regional Water Board for any discharge from an OWTS, or from a category of OWTS.

Effective Date

13.0 This Policy becomes effective six months after its approval by the Office of Administrative Law, and all deadlines and compliance dates stated herein start at such time.

Final Draft

Waiver – Effective Date – Financial Assistance

3/20/2012

Financial Assistance

14.0 Local Agencies may apply to the State Water Board for funds from the Clean Water State Revolving Fund for use in mini-loan programs that provide low interest loan assistance to private property owners with costs associated with complying with this Policy.

14.1 Loan interest rates for loans to local agencies will be set by the State Water Board using its policies, procedures, and strategies for implementing the Clean Water State Revolving Fund program, but will typically be one-half of the States most recent General Obligation bond sale. Historically interest rates have ranged between 2.0 and 3.0 percent.

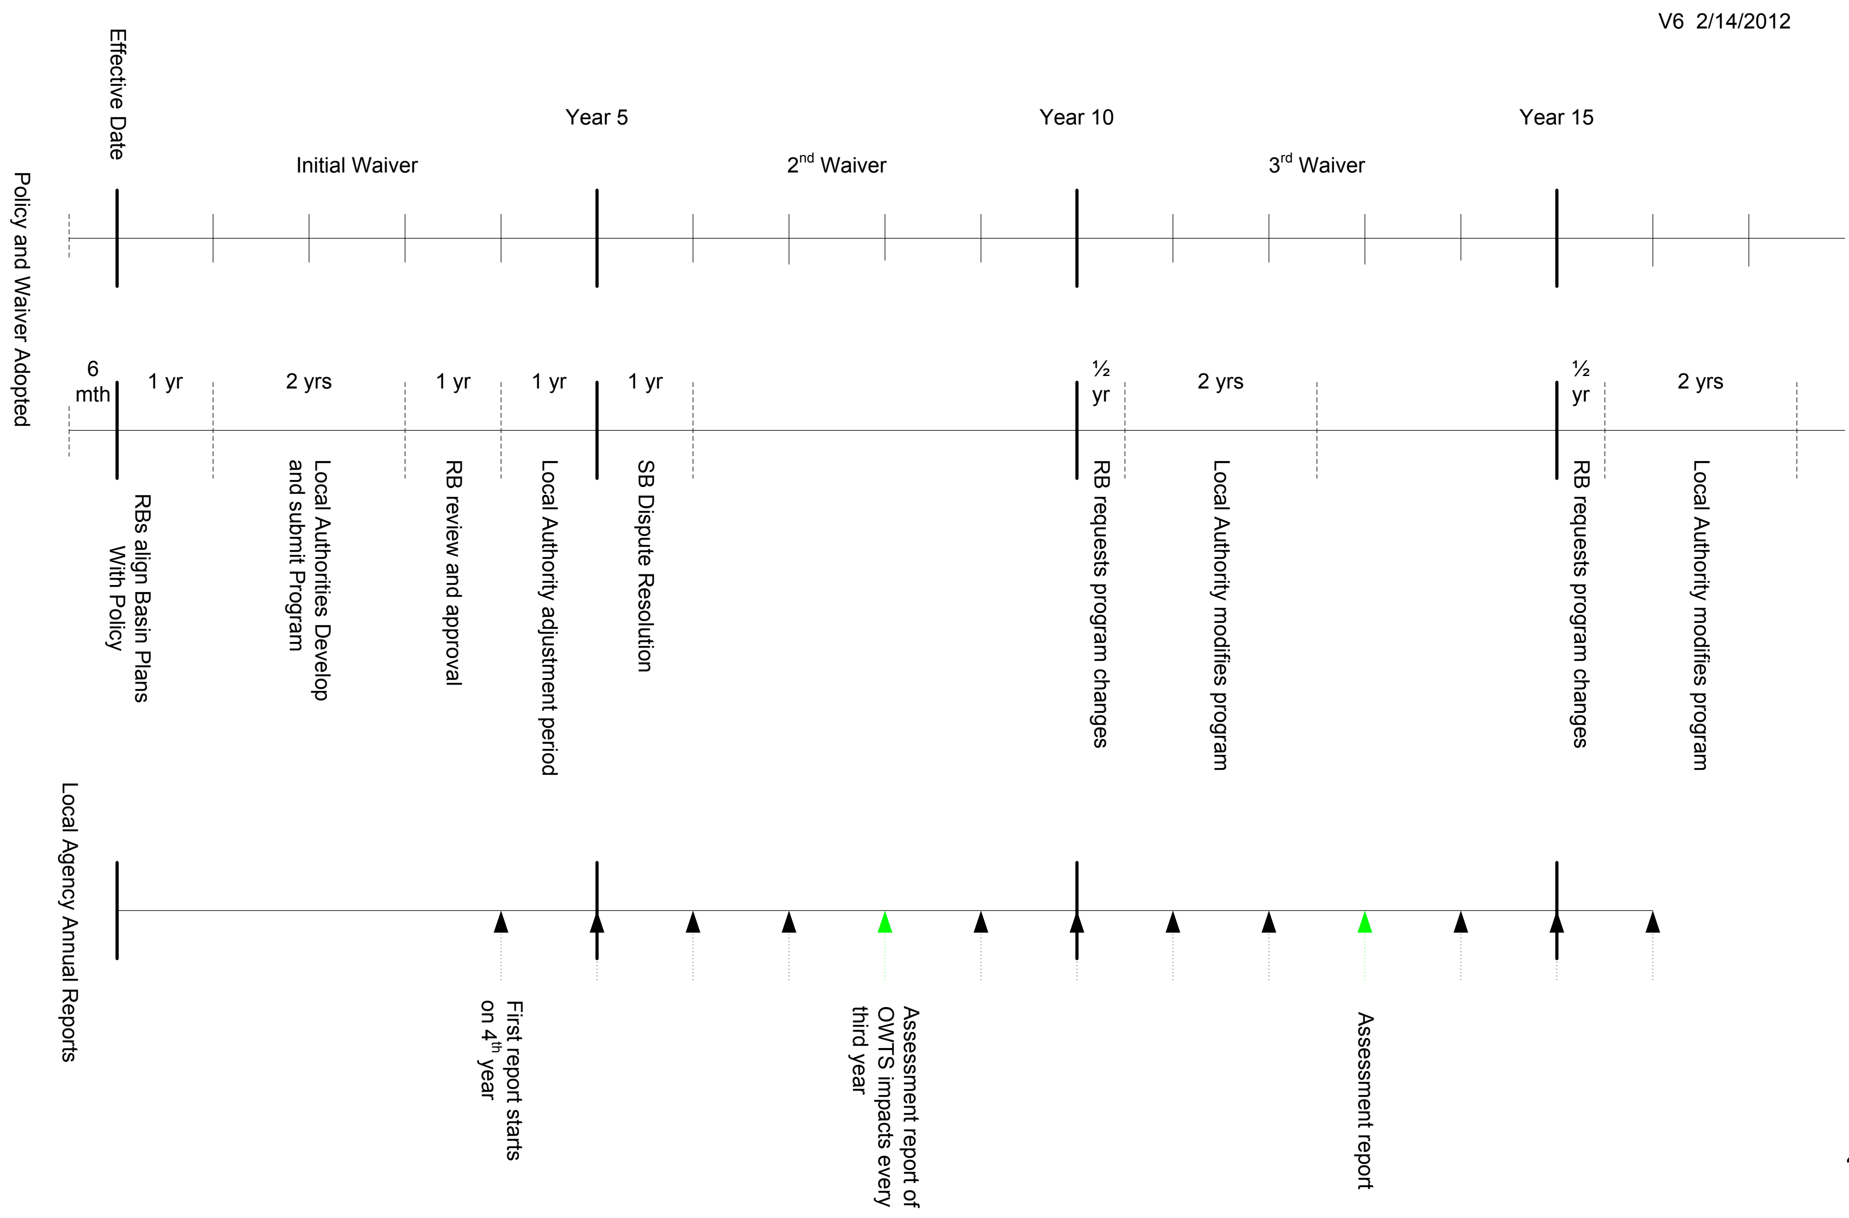
14.2 Local agencies may add additional interest points to their loans made to private entities to cover their costs of administering the mini-loan program.

14.3 Local agencies may submit their suggested loan eligibility criteria for the min-loan program they wish to establish to the State Water Board for approval, but should consider the legislative intent stated in Water Code Section 13291.5 is that assistance is encouraged for private property owners whose cost of complying with the requirements of this policy exceeds one-half of one percent of the current assessed value of the property on which the OWTS is located.

Attachment 1 – Final Draft

3/20/2012

AB 885 Regulatory Program Time Lines



Attachment 2 – Final Draft

3/20/2012

The tables below specifically identify those impaired water bodies where: (1) it is likely that operating OWTS will subsequently be determined to be a contributing source of pathogens or nitrogen and therefore it is anticipated that OWTS would receive a loading reduction, and (2) it is likely that new OWTS installations discharging within 600 feet of the water body would contribute to the impairment. Per this Policy (Tier 3, Section 10) the Regional Water Boards must adopt a TMDL by the date specified in the table. The State Water Board, at the time of approving future 303 (d) Lists, will specifically identify those impaired water bodies that are to be added or removed from the tables below.

Table 4. Water Bodies impaired for pathogens that are subject to Tier 3 as of 2012.

Attachment 3 – Final Draft

3/20/2012

Regional Water Boards, upon mutual agreement, may designate one Regional Water Board to regulate a person or entity that is under the jurisdiction of both (Water Code Section 13228). The following table identifies the designated Regional Water Board for all counties within the State for purposes of reviewing and, if appropriate, approving new Local Agency Management Plans.

Table 6. Regional Water Board designations by County.

County	Regions with Jurisdiction	Designated Region

Introduction

Welcome to the 2010-11 El Dorado County Economic & Demographic Profile. This document contains important information about El Dorado County's residents and communities. The data have been compiled to represent trends over the past ten to twenty years, where comparable data are available, and in some cases include projections for the next 20 years. The information can be used for many purposes, including workforce and small business development, market analysis, and grant writing. By exploring the structure of El Dorado County in various aspects, the Center for Economic Development (CED) and its partners hope to facilitate development and planning for both business, communities, and residents of the county.

As a community outreach organization of the CSU, Chico Research Foundation, CED receives funding from several sources, including the Economic Development Administration of the U.S. Department of Commerce, the U.S. Small Business Administration, the California Public Utilities Commission, and many non-profit and local government organizations throughout California.

Based on client surveys and requests, as well as new research, CED updated this series to include more accurate and up-to-date information, revised narratives, and improvements in data display.

CED continues to welcome any comments and/or suggestions for improvement. In addition, we have access to community research and analysis professionals both in-house and within the communities we serve, and upon request will gladly facilitate to our fullest capacity additional community data research not included in this profile. For additional data on this county, please call (530) 898-4598.

CED cordially thanks El Dorado County and the El Dorado County Economic Development Department for sponsoring the 2010-11 El Dorado County Economic and Demographic Profile.

This document was compiled by the Center for Economic Development (CED) at California State University, Chico, this profile is distributed without charge by CED through the sponsor. For information about sponsoring other county profiles, please contact us at 530-898-4598.

El Dorado County

Location and Demographics

El Dorado County is thirty miles east of Sacramento, and offers many nice suburbs for those who commute to Sacramento during the workweek. As the site of James Marshall's first gold finding in 1848, El Dorado County became the epicenter for the gold rush madness that seized California in the nineteenth century. The gold rush brought visitors from Europe and Mexico, as well as other U.S. states. Their diverse cultural influence is still seen today in El Dorado County. El Dorado County encompasses 1,711 square miles and is home to approximately 182,000 people.

Recreation

For anyone who enjoys nature or outdoor sports and recreation, El Dorado Coutny is one of the most diverse, exciting, and beautiful areas in Northern California. When not enjoying world-class skiing at Lake Tahoe, visitors can enjoy river rafting and kayaking on the South Fork of the American River. For history buffs, the Marshall Gold Discovery State Park Historic Museum celebrates the origins of the gold rush and offers a unique perspective on the past. Several nineteenth century houses in El Dorado County have been converted into bed and breakfast inns, providing visitors with quaint, affordable lodging.

Economy

The Lake Tahoe area and the ski resorts within are excellent sources of revenue for El Dorado County. Skiers from all over the world visit during the winter months. El Dorado County has a largely agricultural economic base during the rest of the year. Apple orchards grow throughout the eastern parts of the county, and apple exports are a reliable source of seasonal income when the hustle and bustle of ski season ceases. The Sierra Nevada range is also in El Dorado County, where logging industries provide additional economic stimulus. Gold is still found in El Dorado County, lending a feeling of excitement to the area's economic environment.

1. Demographics

Demographic indicators describe the characteristics of human populations and population segments, and are especially helpful in determining consumer spending patterns. Knowledge about the age, ethnic, and cultural aspects of the population provides more specific information regarding consumer preferences. This approach, known as market segmentation, is particularly useful for businesses needing to determine the extent of the market for a particular good or service. This information is also useful in evaluating education, housing, and employment opportunities and needs. In addition, demographic information is useful to grant writers and local governments during the process of determining the need and acquiring funding for specific public services in the area.

Demographic trends are typically the foundation upon which other community indicators are built. While this section focuses mostly on population counts and breakdowns of population (by age, race/ethnicity, etc.), most other sections focus on the characteristics of the population (such as Community Health) or of portions of the population (such as Labor Market).

When analyzing population data, it is important to understand the difference between an estimate and a projection. An estimate is based on other related data or change in this data, during the year for which the estimate is made. A projection is based on data trends, calculated over a number of years, and is used to forecast or project future levels, assuming past trends are unchanged. For example, total population in past years is an estimate because it is based on housing growth (among other factors) during the year in which total population is estimated and future total population is a projection.

Population by age is a projection because there is no data after the 2000 Census that can be used to accurately estimate how many people there are in each age group. The projection is based on 2000 Census data and past trends, including those for in migration and death rates by age group. The resulting forecast is only reliable if those trends continue for the years between the census data and the year for which the projection is made.

In this section:

1.1 Total population

Overview

Total population is the number of people who consider the area their primary residence. It does not include persons residing here less than half the year, or persons who are here temporarily, only for work (unless they consider this area their primary residence). The data is estimated annually by the California Department of Finance and reflects population estimates on January 1 of that year. The data is released annually on or around May 1.

The three-year average change is the compound annual change over the past three years.

Population represents a general overview of the size of the consumer market, labor availability, and the potential impact of human habitation on the environment. The data is often required for grant applications and business and community development plans.

El Dorado County

El Dorado County is currently home to 182,019 people, with a projected population of over 225,439 by 2020. This projection is supported by the fact that population increase has been steady for the last ten years, with an average annual increase of almost 2 percent. Between 2000 and 2010, the total population increased 17 percent in the county. This steady increase is due to a greater number of births than deaths in the area and a steady growth in employment opportunities (see section 1.3, Components of Population Change).

NOTE: An estimate is based on other related data or change in this data during the year for which the estimate is made. A projection is based on the same data measured in previous years, calculated out to what it would be in the year for which the projection is made if past trends remained constant.

1.2 Population by City

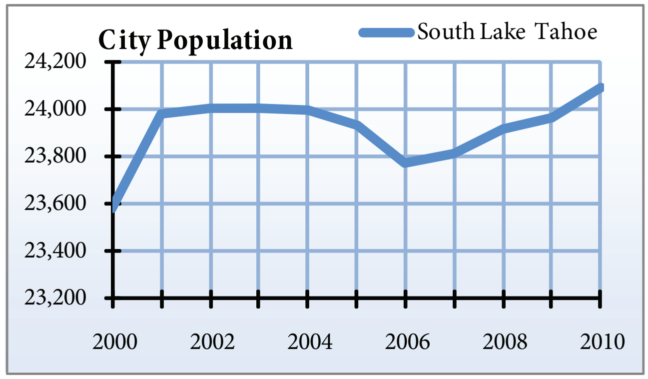
Overview

The California Department of Finance estimates the number of people living within each incorporated place in California as of January 1 of each year. An incorporated place is one with its own governmental body, including a city or town council. Not all places are incorporated.

El Dorado County

Of the two incorporated cities in El Dorado County, the city of South Lake Tahoe was the most populous, with 24,087 people in 2010. However, the city of Placerville was the fastest growing incorporated city in the county, with an annual average population increase of 1 percent between 2000 and 2010.

The following figures present population data by city from 2000 to 2010.



City Population

1.3 Components of Population Change

Overview

The California Department of Finance does annual estimates on how births, deaths, and net migration influence annual population change at the county level. The number of births and deaths is on record from the California Department of Public Health. Births minus deaths equals the natural rate of change. The remaining change in population is due to net migration. Net migration is in-migration minus out-migration. In- and out-migration are not independently estimated by the Department of Finance.

If growth is primarily due to natural increase, then the community may be a place where families are growing. If natural rate of change is negative (more deaths than births), then generally age distribution is weighted towards the elderly. Migration can occur for several reasons. People may migrate either in or out due to employment opportunities, housing prices, quality of life, etc.

NOTE: Birth and Death estimates in this section do not precisely match those in the health section because the sections show different cutoff dates. This section is July 1 through June 30, while birth and death data in section 8 is for the calendar year.

Components of Population Change

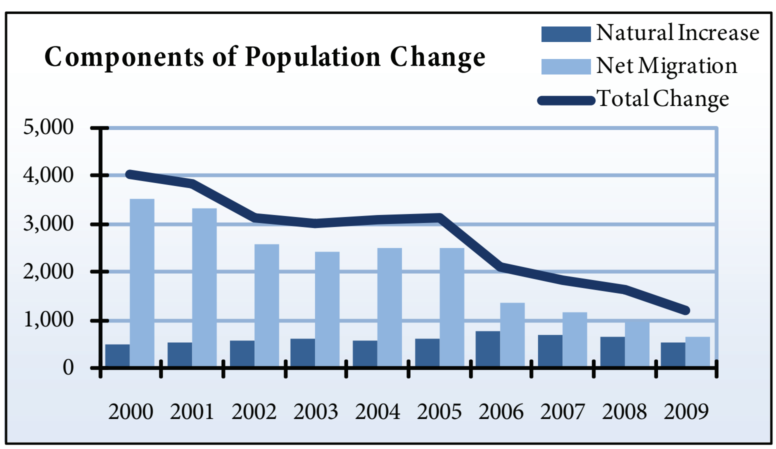
Year	Births	Deaths	Net Foreign Migration	Net Domestic Migration	Total Change
2000	1,575	1,096	256	3,283	4,018
2001	1,679	1,142	336	2,975	3,848
2002	1,737	1,180	273	2,296	3,126
2003	1,781	1,174	257	2,153	3,017
2004	1,834	1,258	209	2,295	3,080
2005	1,871	1,256	287	2,209	3,111
2006	2,022	1,269	279	1,082	2,114
2007	1,937	1,243	365	792	1,851
2008	1,902	1,235	401	576	1,644
2009	1,754	1,227	272	398	1,197

Source: California Department of Finance, Demographic Research Unit

Created by: Center for Economic Development, California State University, Chico

El Dorado County

In 2009, there was a net migration of 670 people to El Dorado County. There were 1,754 births and 1,227 deaths in the county in the same year, resulting in a natural increase of 527 people. The figures below present the components of population change in El Dorado County since 2000.



1.4 Age Distribution

Overview

Population breakdowns by age are projected by the California Department of Finance (DOF) as of July 1st of each year. The projections use the 2000 Census as a base. These models are based on total net migration and fertility rates by ethnicity. There is little data available, other than what is collected for the census, that would produce more accurate projections of population by age.

Age distribution information is valuable to companies that target specific age groups. It is used for revenue projections, business plans, and for marketing purposes. The age distribution in a given area affects the area's school system, public services, and overall economy. It is also an important measure of diversity within a community. A large older teen and young adult demographic has a greater need for higher education and vocational training facilities, while a large middle-aged group creates more focus on employment opportunities. An area with a large mature or retired population typically has fewer employment concerns, but a greater need for medical services. A county with a large number of young children is attractive to day care centers, and other family related services. Age distribution information is also used in conjunction with components of population change in order to project population growth in the future.

El Dorado County

The largest age group in El Dorado County in 2010 is the 50-59 year-old range which represents 17.6 percent of the total county population. This group is followed by those ages 40-49 with 16 percent. Since 2000, the number of people ages 50-59 increased over 55 percent, while those ages 30-39 decreased nearly 27 percent, causing a 5 percent decrease among children in the 0-9 year-old range. Simultaneously, residents 60-69 make up a higher percentage of the population in El Dorado County than the state average.

See the chart for more details on age distribution in El Dorado County since 2000.

Age Distribution

Year	0-9	10-19	20-29	30-39	40-49	50-59	60-69	70-79	80+
2000	20,471	24,817	13,312	21,933	30,080	21,472	12,847	9,210	4,479
2001	20,012	26,175	12,986	21,722	31,017	23,018	13,452	9,362	4,819

1.5 Population by Race/Ethnicity

Overview

While sometimes difficult to classify, race and ethnicity of a population is self-determined, meaning that individuals identify their own race or ethnicity in the census. There are five race categories: American Indian, Asian, Black, White, and other. Alternative names for these classifications are also used to address matters of social sensitivity, although the people classified in each of these categories remains the same. The CED uses these classifications only because these are the names used by the U.S. Census Bureau.

The 1990 Census asked people to choose their primary racial category. The question changed for the 2000 Census, which allowed respondents to choose as many race categories as they deemed appropriate, leading to a change in the data categories for 2000.

Hispanic is an ethnic classification. Some people who consider themselves Hispanic do not consider themselves to be members of one of the four specific race categories, and therefore classify themselves as "other." The California Department of Finance responded by adding Hispanic origin as a separate category in its projections of population by race. In the data table, Hispanic includes all persons who consider themselves to be of Hispanic origin, while all other categories exclude this group. Therefore, the sum of all categories is equal to the projected population in each year.

As with age distribution, population by race/ethnicity is a projection based on data from the 2000 Census. All projections are for July 1 of the given year.

Population by race statistics are used by advertisers to market products to a particular ethnic group and

Population by Race/Ethnicity

Year	Total	White	Hispanic	Asian	Black	American Indian	Other
2000	158,621	135,355	14,787	3,340	776	1,306	3,057
2001	162,563	138,547	15,453	3,362	779	1,309	3,113
2002	165,854	141,112	16,085	3,388	784	1,309	3,176

Created by: Center for Economic Development, California State University, Chico

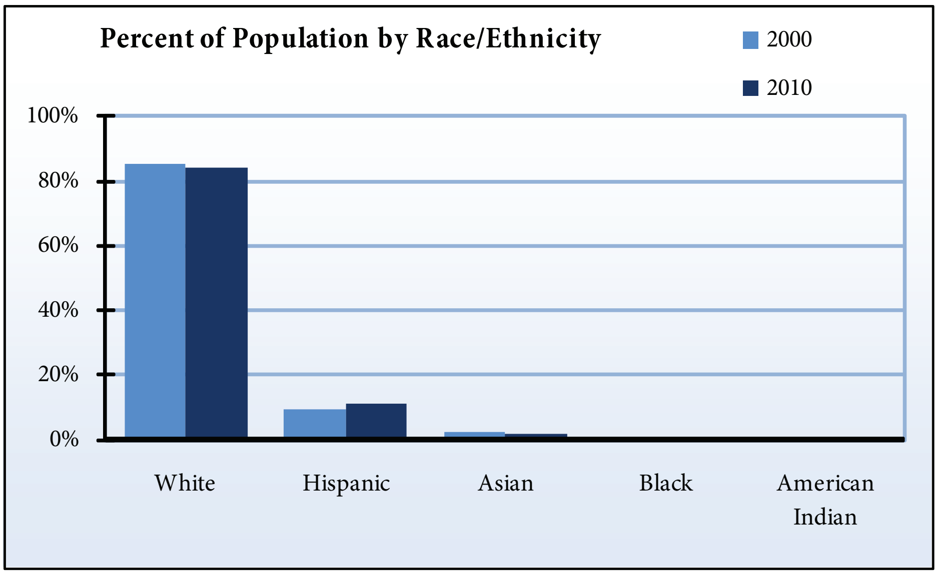
to determine whether investments in businesses with race specific target markets are likely to be lucrative. For example, investing in a start-up Spanish radio station may be a better investment in a predominantly Hispanic area. Advertising companies use race/ethnicity data in order to make their advertisements appealing to the dominant ethnic groups in a given area.

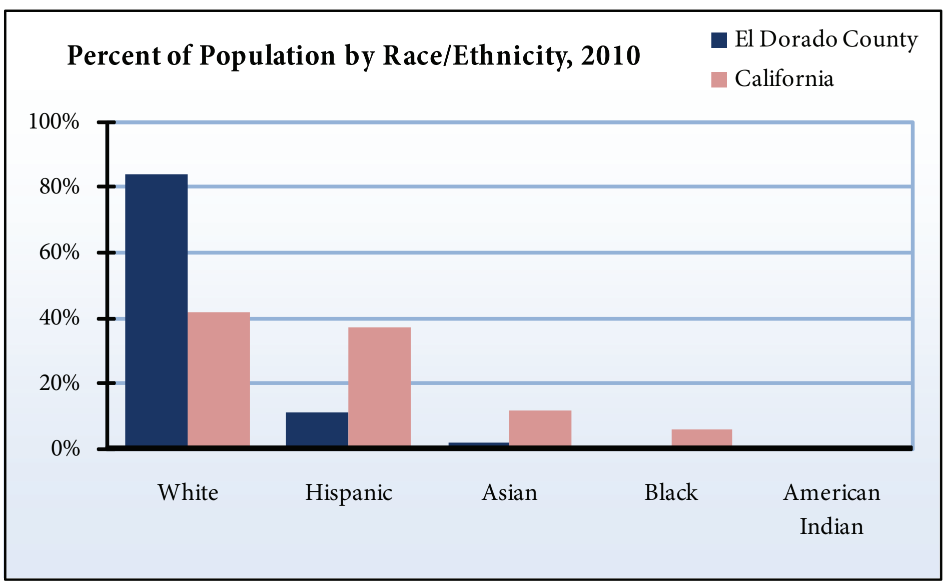
Grant writers use race/ethnicity data to create arguments to acquire funding for programs targeted toward specific groups, or to show population disparities that are favorable in grant priority scoring. Government officials and political candidates also use race/ethnicity data in order to tailor their campaigns to distinct ethnic groups in certain locations.

El Dorado County

Approximately 84 percent of residents in El Dorado County classify themselves as white in 2010, while statewide the white population is 42 percent. Hispanics represented the next largest group, with 11 percent of the population, compared to 37 percent in California. Asians and American Indians are the next largest groups, with 2 percent and 0.7 percent, respectively. Blacks are the smallest census-classified group, with 0.4 percent.

NOTE: The multi-race data is reported on July 1 of each year. This creates a discrepancy between the total population data (section 1.1) and the total population by race/ethnicity data because total population data is collected on January 1 of each year.





1.6 Population by Educational Attainment

Overview

Educational attainment is requested by the U.S. Census Bureau during the decennial census. The data represents the number of people 18 years and over who have achieved a specified level of education.

Educational attainment has a direct influence on family income. Often gains in annual income for men and women result from more education. Conversely, a family's income affects their ability to pay the high costs of pursuing a two-year, four-year, or graduate degree. High educational attainment by the local population exhibits a degree of permanence and can be a factor in attracting new businesses to an area, particularly those requiring skilled workers. Increased income, whether linked to higher educational attainment or other factors, increases tax revenues generated in a particular county through increased taxable retail sales.

Educational attainment information is also used by businesses for market research, primarily by those wishing to target customers of a particular educational level.

El Dorado County

In 2008, 30 percent of El Dorado County residents had some college education with no degree, making them the largest educational group in the area. This rate is higher than the rest of the state, in which 25 percent of all residents had some college education as their highest level of education. High school graduates and residents holding bachelor's degrees were the next most common educational groups in El Dorado County, at 26 and 19 percent, respectively. In 2008, El Dorado County was above the statewide average for residents having an associate's degrees, as their highest level of education.

Population by Educational Attainment, Population 18 and Over

Educational Attainment	2000	2008
Less than 9th grade	3,162	2,329
9th to 12th grade, no diploma	10,993	9,756
High school graduate, GED, or alternative	27,199	36,163
Some college, no degree	36,430	41,389
Associate's degree	9,633	12,032
Bachelor's degree	19,318	26,190
Graduate or professional degree	8,876	10,321

1.7 Net Migration

Overview

This indicator includes information concerning migration patterns between El Dorado and other nearby counties with the highest levels of migration interaction. It includes the top five counties in terms of out-migration, the top five in terms of in-migration, and their respective median income levels. Collected from the Internal Revenue Service (IRS) database, these numbers are based on taxes paid by all citizens.

In-migration is the number of people moving into El Dorado County from some other area in the world and out-migration is the number moving from El Dorado County to other areas. Net migration is in-migration minus out-migration.

This indicator provides information on likely changes in the economic, political, and social structure of an area based on the characteristics of the area from which the migrants originate. For example, migrants coming from large cities bring with them a particular set of characteristics and values that may affect the local political climate. They also bring their patterns of consumer spending that create opportunities for businesses to provide the kinds of products and services these individuals are accustomed to receiving at their urban place of origin.

Neighboring counties, as well as those with higher population totals, generally show the most migration activity. However, if a non-neighboring county, even one with a smaller total population, is present among the top five counties in terms of migration, there may be a unique interaction that is worth further evaluation.

That portion of population growth driven by in migration is the product of some economic factor or amenity attracting new residents. The attraction could be an increase in employment opportunities, the recognition of the environmental advantages of the area, or expanding business opportunities. In general, new residents do not move to an area without good reason, and when they do, they fuel economic expansion.

El Dorado County

Two of the top five counties for in migration lie within close proximity of El Dorado County, while two Bay Area counties are also among them. Interestingly, El Dorado County had a Southern California county among its top five for in migration.

Top 5 Out-Migration by County 2007-08

1.8 Voter Registration

Overview

Voter information includes voter registration and political party affiliation. The choice of a party generally reflects certain attitudes towards government including relative tolerance for higher taxes, land preservation, and allocation of local government funds. The information made available from voter registration data may provide general guidance to local government in terms of its role in public policy and fiscal matters.

A registered voter may or may not choose a political party. The data presented shows the number of registered voters for each party, and party members as a percentage of the total number of registered voters. The accuracy of this data depends on the ability of the county clerk to update their voter rolls and remove those who no longer live at the address where they registered.

NOTE: In the following table, those persons registered to vote are shown as a percent of the total eligible.

Voter Registration as of May 24, 2010

Political affiliation	Number of people	Percent of total eligbles
Eligible	128,827	n/a
Registered	105,163	81.6 %
Democratic	32,173	30.6 %
Republican	47,249	44.9 %
American Independent	3,373	3.2 %
Green	895	0.9 %
Libertarian	768	0.7 %
Peace and Freedom	262	0.2 %
Miscellaneous	772	0.7 %
Decline to affiliate	19,671	18.7 %

Source: California Secretary of State, Elections Divisions
Created by: Center for Economic Development, California State University, Chico

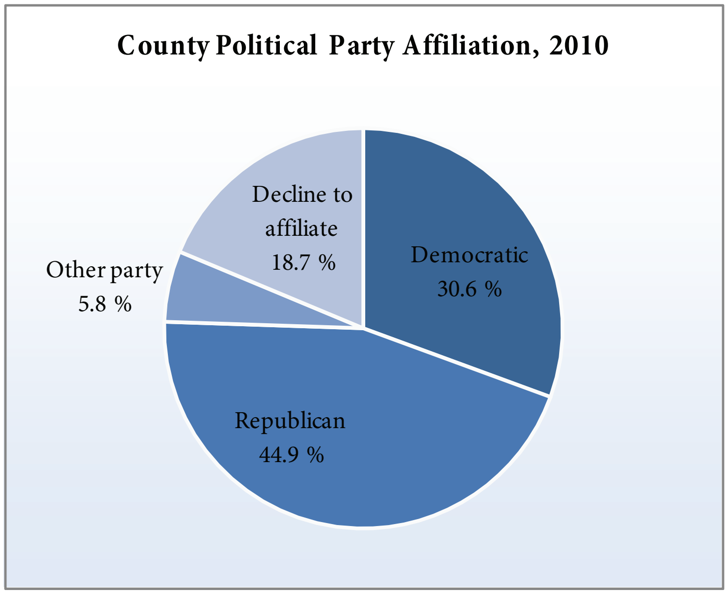
People typically choose a political party representing social and economic values close to their own. Therefore, political party membership may allow a business or organization to evaluate whether the community may or may not support particular proposals for development or regulation.

Registrants as a percentage of those estimated to be eligible to vote may indicate the level of civic participation and political involvement within the community. Communities with high levels of voter participation ordinarily have a strong sense of community and that may be a characteristic attractive to potential new residents and also to new businesses and potential employers.

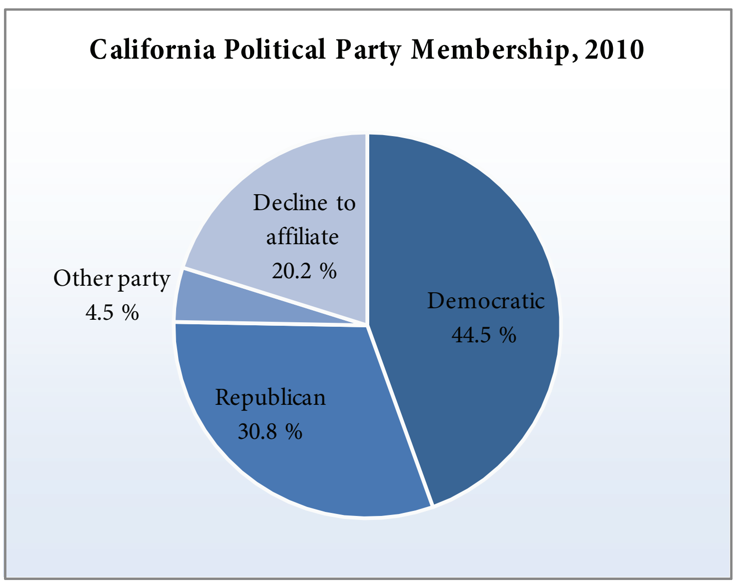
El Dorado County

As of May 2010, of the nearly 129,000 El Dorado County residents eligible to vote, 81.6 percent were registered. In comparison, 72.4 percent of eligibles in California, were registered.

In the county, 30.6 percent of registered voters were registered Democrat and 44.9 percent were registered Republican. In California, 44.5 percent of eligible voters were registered Democrat and 30.8 percent were registered Republican. For a complete listing of registered voters by political affiliation, please see the chart to the left.



County Political Party Affiliation, 2010
Decline to affiliate 18.7 %
Democratic 30.6 %
Other party 5.8 %
Republican 44.9 %



California Political Party Membership, 2010
Decline to affiliate 20.2 %
Other party 4.5 %
Democratic 44.5 %
Republican 30.8 %

2. Environmental Factors

Environmental factors can influence a county's agriculture, economic standing, recreation, and the quality of life of its residents. Climate is a key factor in determining what types of limitations or opportunities exist for agricultural production or recreational activities. This section provides information useful for making decisions concerning residential and business location.

Many state parks in El Dorado County offer a variety of recreational opportunities. Due to the mountainous geography and extreme seasonal weather changes, the recreational opportunities are ever-changing.

In this section:

2.1 Land Area & Population Density

Overview

Population density is determined by dividing the total population of the area by its size in land area. This section shows population density in persons per square mile of land area, a commonly used measure.

Land Area and Population Density

Year	Land area (sq. miles)	Total population	Population density (per sq. mile)
1991	1,711	130,181	76
1992	1,711	134,898	79
1993	1,711	138,788	81
1994	1,711	141,843	83
1995	1,711	143,863	84
1996	1,711	145,949	85
1997	1,711	148,373	87
1998	1,711	150,857	88
1999	1,711	153,232	90
2000	1,711	155,702	91
2001	1,711	160,419	94
2002	1,711	163,871	96
2003	1,711	166,908	98
2004	1,711	169,926	99
2005	1,711	172,987	101
2006	1,711	175,530	103
2007	1,711	177,379	104
2008	1,711	178,860	105
2009	1,711	180,185	105
2010	1,711	182,019	106
2020(p)	1,711	225,439	132
2030(p)	1,711	267,535	156

Source: California Department of Finance
Created by: Center for Economic Development, California State University, Chico

The concept of "urban" versus "rural" is a relative one. For example, people living in Sacramento might consider the city of Placerville to be rural, while residents of Pollock Pines may consider Placerville to be "the city." Population density provides a quantitative measure of the degree of an area's urbanization.

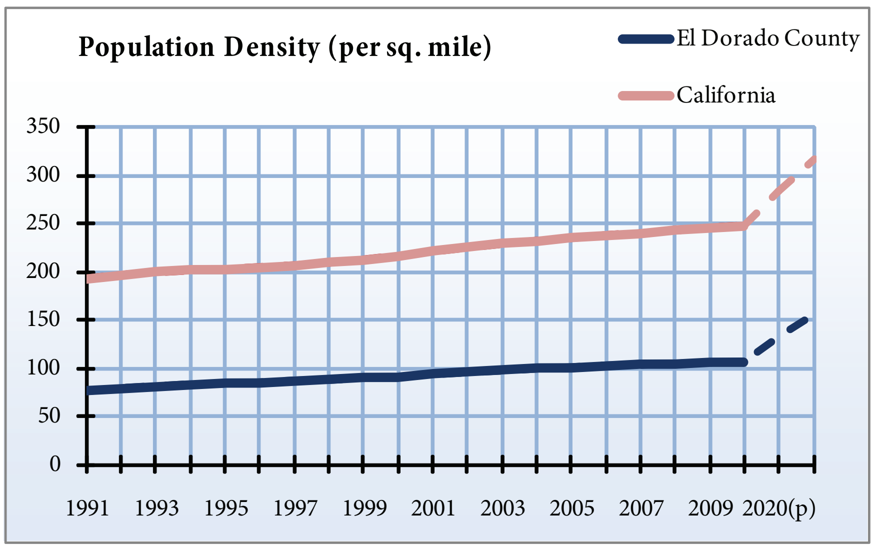
This measure can be an important quality of life indicator for an area. Economic use for land includes the production of raw materials, factories and other production facilities, office space, housing, food production, recreation, and transportation of goods and people. As population density rises, certain activities become more expensive to maintain. Farming can be crowded out by more profitable industrial or residential development. This structural change is likely to be associated with increasing area economic activity, but can also lead to adverse impacts on the quality of life. Vehicle use also rises and as more vehicle miles are traveled in a confined location, traffic slows down causing more congestion. This not only increases commute time, but also increases air pollution emissions per square mile. As a result, in addition to the positive impacts of the associated economic growth, an increase in population density can have negative impacts on the mental health (stress) and physical well-being (increased exposure to toxins) of a community.

Persons per acre, rather than persons per square mile, is a measure more commonly found in large dense cities, or by local government planning departments when evaluating community density or the density of a proposed development. To convert persons per square mile to persons per acre, divide persons per square mile by 640.

Population density can be used in grant writing and when comparing the degree of urbanization of different counties or areas.

El Dorado County

El Dorado County's total land area is 1,710.8 square miles. Because population has increased while land area has remained constant, El Dorado County's population density has steadily risen over time. As of 2010, the population density in the county was 106 residents per square mile, putting it well below the statewide average population density of 248 people per square mile. It is projected that by 2020 the population density in El Dorado County will reach 132 people per square mile.



2.2 Urban Land Consumption

Overview

Every two years, the California Department of Conservation conducts aerial land surveys in agricultural areas to determine the extent to which farmland may or may not be replaced by other uses over time. Generally, the most common use into which agricultural land is converted is developed urban land.

Reductions in agricultural land permanently reduce agriculture as an industry in the county, which may be a critically important base industry in some counties. Many planners consider development that does not consume agricultural land as being more beneficial to the community.

El Dorado County

Since 1984, urban land has consumed not only farmland, but grazing land as well. Urban land has increased by over 12,000 acres, an increase of 63 percent, while farmland has decreased by nearly 13,000 acres, or 16 percent. There has also been a decrease in grazing land of 6,000 acres and an increase in other land of 6,000 acres.

Urban Land Consumption (acres)

Year	Farmland	Grazing Land	Urban and Built-Up Land	Water Area	Other Land
1984	77,949	200,664	19,803	6,937	231,051
1986	77,970	199,623	21,131	6,924	230,756
1988	78,094	197,964	23,008	6,924	230,413
1990	78,064	195,365	23,779	6,924	232,272
1992	88,125	186,196	24,295	6,924	230,863
1994	88,531	186,126	24,339	6,893	230,515
1996	88,254	185,418	25,360	6,893	230,479
1998	88,146	185,283	25,690	6,880	230,404
2000	68,292	203,798	26,132	6,819	231,361
2002	67,508	201,738	28,557	6,819	231,780
2004	66,681	196,900	30,670	6,820	235,332
2006	65,844	195,958	31,359	6,819	236,426
2008	65,105	194,779	32,195	6,819	237,508

2.3 Climate

Overview

This indicator shows climate readings from selected weather stations in El Dorado County. Climate data is collected on an ongoing basis and is reported by the Western Regional Climate Center in December of each year unless otherwise noted. The data expresses an annual average calculated over the time indicated below.

It is important to know what types of weather a certain area may experience because of extremes of heat and cold, and severe storms may reduce the desirability of an area for tourists or retirees. These conditions may occur in a particular season and limit the attractiveness of an area at certain times of the year. This information can be useful for determining which particular businesses might be viable in a specific area.

El Dorado County

Weather in El Dorado County is wildly variable. The County spans from the Central Valley to Lake Taho so it is difficult to identify a weather station that represents the El Dorado County climate. The following figure shows the average temperatures and precipitation rates in winter and summer for each weather station in the county.

NOTE: The data here reflects an average of monthly readings taken between the following years for each site:

Georgetown:	1/1/1893 to 11/30/1967
Placerville:	1/1/1900 to present
Squaw Valley Lodge:	10/13/1955 to 10/31/1975
Tahoe:	9/13/1903 to 9/30/2010

Climate Station Readings as of July 2010

	Georgetown	Placerville	Squaw Valley Lodge	Tahoe
Average July maximum temp. (deg.)	89.4	92.7	80.1	77.9
Average January maximum temp. (deg.)	51.2	53.4	39.5	38.5
Average July minimum temp. (deg.)	59.5	51.9	42.1	44.4
Average January minimum temp. (deg.)	35.2	32.6	14.6	19.0
Average July precipitation (in.)	0.0	0.1	0.7	0.3
Average January precipitation (in.)	10.6	6.9	9.7	6.0
Average annual precipitation (in.)	53.0	38.1	51.0	31.4
Average January snowfall (in.)	9.2	1.2	54.9	45.9
Average annual snowfall (in.)	31.8	2.5	246.6	190.7

2.4 Air Quality

Overview

Air quality is the general term used to describe various aspects of the air that plants and human populations are exposed to in their daily lives. There are four main contaminants that decrease air quality: particulates (PM 10 and PM 2.5), tropospheric ozone (O3), carbon monoxide (CO), and oxides of nitrogen (NOX). Air pollutants are emitted by both stationary and mobile sources. Stationary sources include factories, power plants, and agricultural burning (forest fires and field burning). Mobile sources of pollution include automobiles, motorcycles, trucks, buses, and various types of recreational vehicles. Mobile sources are primarily responsible for the decrease in air quality in Northern California.

Air quality standards are set at both state and federal levels. The allowable levels for a particular pollutant are established in affect to protect human health, avoid damage to sensitive vegetation, and preserve aesthetic values. If a region is in violation of one or more standards for allowable levels of the above four pollutants, the state may limit the type of new industrial facilities that can be built in the area and place more restrictions on existing operations in the future.

PM2.5 and Ozone are shown in this report because the California Air Resources Board includes metrics indicating long-term (8-hr) exposure to these pollutants. Long-term exposure is far more detrimental to human health than short-term (1-hr.) exposure. State standards are reported because they are higher than federal standards.

As industry, agricultural production, and traffic continues to increase across California, air quality becomes an important issue. Air quality affects all populations, especially the young, the elderly, and those with heart or lung problems. Ultimately, a county with high levels of pollutants will also see an increased need for health services. Air quality can be an important factor in determining where people are willing or able to live.

PM2.5 - Particulate matter over 2.5 microns in diameter composed of very small bits of ash, wood tars, soot and other substances created by combustion. Examples of sources include cars and trucks (especially diesels), woodstoves, and open burning. PM2.5 particles are so small that they can evade the body's natural defense mechanisms and penetrate deep into lung tissue. They can damage lung tissue, which can lead to serious respiratory problems.

O3 - Ozone. Concentrations are measured in parts per million. Sources include cars and trucks (especially diesels), industrial sources like chrome platers, neighborhood businesses, such as dry cleaners and service stations, and building materials and products. Overexposure to O3 can cause breathing difficulties and lung damage. Ozone is an invisible pollutant formed by chemical reactions involving nitrogen oxides, reactive hydrocarbons, and sunlight. It is a powerful respiratory irritant that can cause coughing, shortness of breath, headaches, fatigue and lung damage, especially among children, the elderly, the ill, and people who exercise outdoors. Ozone also damages plants, including agricultural crops, and degrades manufactured materials such as rubber and paint.

El Dorado County

In 2009, the county air quality did not exceed state or federal standards, however, the county did spend 40 days over the state 8 hour ozone average in the same year. See the table on the next page.

Air Quality

Year	Number of Days Above State 8 hour Ozone Average	Number of Days Above State PM2.5 Average
1999	94	0

2.5 Water Depth Table

Overview

Periodically, the California Department of Water Resources tests groundwater wells for pollution or contaminants. One of the outputs of this testing includes depth to groundwater. The CED used wells in the county with consistent measurement between 1999 and 2010, and corrected for wells not measured in any particular year.

Water is scarce in most parts of California, creating tremendous pressure to redistribute the state's water resources and to find new sources and ways to store and deliver water more efficiently. In addition, water is only plentiful parts of the year. Typically, whenever water shortages occur, groundwater is used to supplement surface water storage and delivery. Therefore, groundwater levels are the best measure to determine the sustainability of water availability, whether or not significant amounts of groundwater are used.

El Dorado County

Overall, El Dorado County has experienced little groundwater change over the past ten years. Depths have fluctuated between 22 and 30 feet deep, with an increasing long-term trend. Between 1999 and 2010 water table depths increased an average of 3.2 percent per year with a net change of approximately 8 feet.

County Water Table Depth

Year	Average Depth to groundwater (ft)

2.6 Generation Capacity

Overview

The California Department of Energy is responsible for licensing and monitoring of all electrical power plants in California with a capacity greater than 1/10 of a megawatt. Actual electricity production is not collected and reported by the state. Although the federal government requires production reporting for power plants with greater than 100 megawatts of capacity, this represents a small fraction of generation in most areas.

Electricity production provides economic value of environmental features to the local community. Depending upon the type of generation, it indicates the degree to which renewable or green electricity if produced in and benefits the local community.

El Dorado County

All of El Dorado County's generation capacity comes in the form of hydroelectric power, generating a total of 739.5 megawatts of power.

Generation Capacity

Facility	Megawatts
Coal	0.0
Geothermal	0.0
Hydroelectric	739.5
Nuclear	0.0

3. Labor Market

Labor market conditions are an important indicator of an area's economic well-being. Of particular importance is the relationship among all of these factors: labor force, employment, unemployment, and monthly employment. While alone, one of these factors might project an incomplete image of the economy's performance, taken together, they provide a comprehensive assessment of the health of the labor market and the associated well-being of affected residents.

Labor market information can be used to draw conclusions about the availability of jobs, the social climate, and the standard of living in the area.

The following is a brief summary of the statistical relationship between each of the indicators discussed in this section:

Labor force is equal to employment plus unemployment.

Employment refers to people working at least one hour per week.

Unemployment refers to people working less than one hour per week, but is actively seeking work.

Unemployment rate is equal to unemployment divided by labor force.

The U.S. Department of Labor, Bureau of Labor Statistics uses the twelfth of each month to determine a person's employment status. This date was originally chosen because at one time, there were no holidays in the week that included the twelfth. Although that may not be true now, mid-month time periods are less volatile to changes in the overall business climate.

The average unemployment rate in El Dorado County from 1999 to 2009 was 5.6 percent. Tracking monthly unemployment trends during that time revealed seasonal changes in the level of employment with January seeing the lowest average employment and September and August having the highest employment.

In this section:

3.1 Labor Force

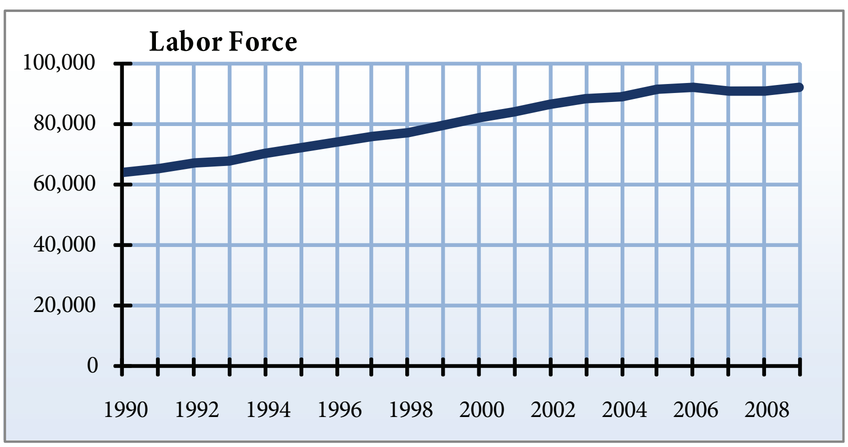
Overview

The labor force is the number of people living in the specified area who are willing and able to work. It is the sum of employment (persons currently working) and unemployment (persons actively seeking work). Therefore, changes in both employment and unemployment affect the labor force. The labor force is estimated monthly by the California Employment Development Department. Annual data is the average of the twelve months of the year.

An increasing labor force indicates a growing economy only if it is the result of increasing employment. If the labor force is growing due primarily to increasing unemployment, then population growth may be occurring in excess of the ability of the economy to provide jobs for new workforce entrants.

El Dorado County

In 2009, 91,800 residents, or 51 percent of El Dorado County's population, were members of the labor force, compared to 48 percent in California. The labor force has increased steadily over the last twenty years, with a 1 percent growth in 2009. This steady increase indicates a perpetual increase in available employment and business growth.



Total Labor Force

Year	Labor Force	1-year change
1990	63,900	n/a
1991	65,500	2.5 %
1992	67,300	2.7 %
1993	67,500	0.3 %
1994	70,500	4.4 %
1995	72,200	2.4 %
1996	74,100	2.6 %
1997	75,700	2.2 %
1998	77,000	1.7 %
1999	79,300	3.0 %
2000	82,100	3.5 %
2001	84,100	2.4 %
2002	86,600	3.0 %
2003	88,100	1.7 %
2004	89,200	1.2 %
2005	91,200	2.2 %
2006	92,100	1.0 %
2007	90,900	- 1.3 %
2008	91,100	0.2 %
2009	91,800	0.8 %

3.2 Total Employment

Overview

The California Employment Development Department (EDD) defines employment as the number of residents who are employed, regardless of whether they work in the county or city of residence: "Civilian employment includes all individuals who worked at least one hour for a wage or salary, were self employed, or were working at least fifteen unpaid hours in a family business or on a family farm during the week including the twelfth of the month. Those who were on vacation, other kinds of leave, or involved in a labor dispute, were also counted as employed."

Increasing employment indicates an increase in economic activity within the area, either by increasing local jobs or increasing the number of workers in residence. Workers spend a large portion of their income at their place of residence (the percentage of which typically depends on the availability and relative price of retail goods in the community). Employment by place of residence is an economic indicator that is typically evaluated alongside the count of jobs by place of work.

El Dorado County

As of 2009, 81,500 members, or 89 percent of El Dorado County's labor force, were employed, a 4 percent decrease from the preceding year. 89 percent of California's total labor force was also employed in the same year. Total employment had been experiencing steady growth since 1990 but experienced its first declines in 2007, 2008, and 2009.

Total Employment

Year	Empl.	1-year change
1990	61,000	n/a
1991	61,100	0.2 %
1992	61,500	0.7 %
1993	61,600	0.2 %

3.3 Unemployment

Overview

Unemployment is the estimated number of people who are actively seeking work and are not working at least one hour per week for pay and who are not self-employed. As with employment, it is estimated at the place of residence. Annual average unemployment is the average of twelve monthly unemployment estimates developed by the California Employment Development Department (EDD).

Unemployment is not a simple count of people who are receiving unemployment insurance payments, although the EDD uses unemployment insurance recipients to help produce its estimates. Not everyone who the EDD considers to be unemployed, including those whose employment is terminated due to poor performance, is eligible for these benefits. Unemployment includes workers who have been laid off and are waiting to be called back to work, though it does not include people who are in prisons, mental hospitals, nursing homes, or those under the age of sixteen, regardless of whether they are seeking work or not.

The unemployment rate is the percent of the labor force that is unemployed. It is often used as a primary measure of economic health, although by itself, changes in the unemployment rate may misrepresent economic performance. For example, take the case of rising employment with a simultaneous rise in unemployment (a common situation in Northern California in the early 2000s). This situation typically produces an increase in the unemployment rate, even when the employment situation is improving. Therefore, employment growth or labor force growth combined with employment growth, are better measures of economic performance.

Still, the unemployment rate is a valuable community indicator. Sustained high unemployment rates typically indicate the presence of societal issues within the community, although what is considered "high" may vary from one community to the next. For communities with a high unemployment rate, social issues may vary as well. See the social indicators sections, nine through twelve, to find connections between the unemployment rate and social issues.

Total Unemployment

Year	Unempl.	Unempl. Rate	1-year change
1990	2,900	4.5 %	n/a
1991	4,400	6.7 %	51.7 %
1992	5,800	8.6 %	31.8 %
1993	5,900	8.7 %	1.7 %
1994	5,100	7.2 %	- 13.6 %
1995	5,000	6.9 %	- 2.0 %
1996	4,700	6.4 %	- 6.0 %
1997	4,200	5.5 %	- 10.6 %
1998	3,800	5.0 %	- 9.5 %
1999	3,100	3.9 %	- 18.4 %
2000	3,400	4.1 %	9.7 %
2001	3,600	4.3 %	5.9 %

Another important issue exposed by unemployment statistics is the number of potentially qualified workers available in the community. As unemployment falls, employers start having a difficult time attracting qualified employees at their offered rates of pay. High-skill workers are typically affected first, such as those in management, technical, and professional occupations, with moderate-skill workers being affected as the unemployment rate continues to fall. Results typically include higher average pay, in combination with out migration of some firms in search of the employees they can no longer find locally.

The lowest unemployment rate calculated over the past ten years, or the lowest unemployment number, can be used to estimate the level at which employers have difficulty finding qualified employees. At the national level the lowest sustainable unemployment rate is called the full-employment unemployment rate, and at that rate, the remaining unemployment is not due to a lack of jobs, but rather structural, frictional, and seasonal factors.

El Dorado County

In 2009, 10,300 members of El Dorado County's labor force were unemployed, making up 11 percent of the labor force. El Dorado County's unemployment rate has been consistently lower than the California average since 1990. For example, when statewide unemployment swelled to 9.5 percent in 1993, El Dorado County's unemployment rate was at 8.7 percent.

3.4 Average Monthly Labor Statistics

Overview

The California Employment Development Department estimates labor market data (labor force, employment, unemployment, and the unemployment rate) for each month. The department uses the week including the twelfth of each month to determine a person's employment status. Mid-month time periods are less sensitive to changes in the overall business climate and are more representative of average conditions. For specific definitions of each measure, please see the previous three indicators in this section.

Average monthly labor statistics are used to evaluate seasonal trends in employment. Areas dependent on agriculture, forestry, or seasonal recreation tend to experience fluctuations in employment over the course of the year that cannot be observed when using the annual average as a measure. The difference in employment in the low and high months can be used to evaluate the degree to which an economy is dependent upon seasonal employment. Many seasonal employees locate temporarily (at winter ski resorts or some types of farms) and leave during the off-season, but some remain year-round and are unemployed during the months of lower employment.

El Dorado County

Between 1990 and 2009, unemployment was lowest in August through October. The highest unemployment rates occurred in January through March, peaking in January at 6.7 percent and decreasing throughout the year.

In all cases, the average monthly unemployment rate for El Dorado County was lower than the statewide average from 1990-2009.

3.5 Jobs by Industry

Overview

Published by the U.S. Department of Commerce, Bureau of Economic Analysis (BEA), this measure of jobs is by place of work; that is, where the job is being performed regardless of where its worker lives. The BEA uses business tax returns from the Internal Revenue Service to calculate jobs by industry. Therefore, each person who worked for a company for pay or profit over the course of a year is counted. That means if a person changed jobs once over the course of a year, they are counted twice—once for each company at which they worked. The same holds true for part-time and seasonal employees who hold more than one job over the course of a year. Self-employed proprietors and members of business partnerships are counted as well. A person with a full-time job who owns or co-owns a business on the side is counted for each job. Unpaid family workers and volunteers, however, are not included.

Some industries may be so small that publishing data could disclose confidential information about an individual business. The BEA will withhold data if there are fewer than four businesses or if one business is responsible for more than 80 percent of the industry's sales. If a withholding occurs, the BEA must withhold data in another category to preserve confidentiality.

Before 2000, jobs by industry was published according to the Standard Industrial Classification. In 2001, that changed to the new North American Industrial Classification (NAICS). The NAICS system of industrial classification was an improvement over the old system because it allowed the separation of important industry groups, such as recreation. Therefore, recreation is its own category starting in 2001. Before 2001, jobs in recreation were classified mostly under retail trade and services.

Job growth by industry sector is a measure of the economic diversity and stability of the local economy. A healthy economy will have a balance between industries. If too many jobs are concentrated in one sector, a downturn in that sector could easily and rapidly weaken the economy.

Job growth is an important indicator for business and government planning, allowing for a better understanding of which sectors are the major generators of jobs in the area and which sectors are continuing to grow. This can provide insight into which industries have the greatest potential for growth in the near future.

El Dorado County

According to the available data, the mining sector had the largest growth in employment between 2007 and 2008 in El Dorado County with a 19 percent increase. Real estate, rental, and leasing employment had the next highest with a 10 percent growth in the county. In El Dorado County, management of companies and enterprises employment decreased 53 percent, and information employment decreased 9 percent in the same year.

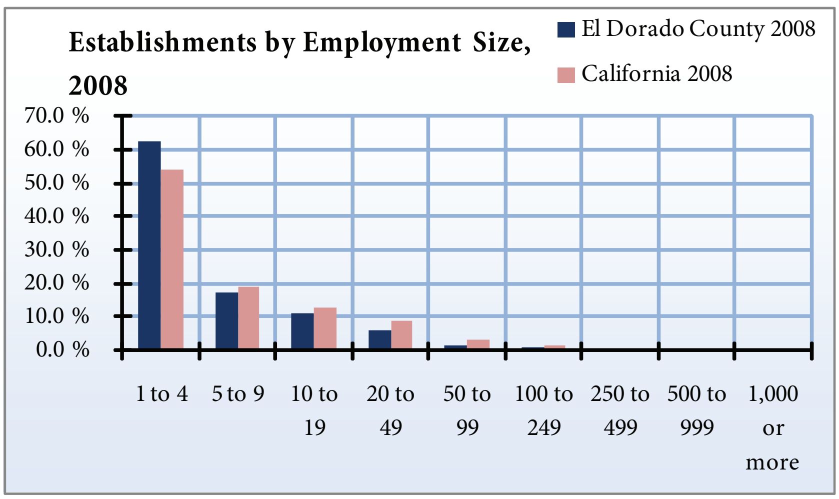
3.6 Employers by Employment Size & Industry

Overview

Each year, the U.S. Department of Commerce's Census Bureau tabulates the number of employers with employees on which taxes are paid. As with Jobs by Industry (the previous section), the tabulations are based on tax returns are collected by the Internal Revenue Service. Establishments without payroll are not included. Most businesses are non-employers, although most jobs are employee positions.

The stability of a local economy is dependent upon a diverse mix of businesses, both in terms of size and industry sector. A diverse employer mix allows an economy to weather economic downturns more easily than one that is dependent on a few types of businesses. For example, during the previous recession the Bay Area was heavily dependent upon computer technology employers when the dot-com crisis hit in 2000. The national economy experienced a small recession during a few months in 2001, but the Bay Area suffered from a much deeper economic downturn that lasted several years.



El Dorado County

In 2008, businesses with one to four employees were the most common in El Dorado County, and made up 62 percent of all establishments. Another 17 percent of the businesses in El Dorado County consisted of five to nine employees, suggesting a strong trend of small local businesses in the county. Statewide, businesses with one to four employees were the most common, making up 54 percent of all businesses in the state.

4. Income

Income affects consumer choice, local retail sales, and is an indicator of current economic conditions. Income influences buying power and income changes allow comparison of local economic performance to that of surrounding areas.

Income is one measure of the benefits to people provided by employment, government, or their own investments. It is the primary connection between employment and the overall benefit jobs provide for residents.

In this section:

4.1 Total Personal Income

Overview

Total personal income is calculated by the U.S. Department of Commerce, Bureau of Economic Analysis. It is the sum of all income collected by individuals, including but not limited to earned income, government payments, and returns on investment. It does not include personal contributions for social insurance (such as payments to Social Security or Medicare).

Total personal income is the basis for several other income indicators in this section. Growing personal income indicates a growing economy, as long as the growth is greater than the annual average inflation rate of 2.3 percent. The growth may be due to increasing incomes, increasing population, or some combination. See the demographics section (section one) and the indicator for per capita personal income later in this section to see which factor is more prominent.

El Dorado County

The total personal income in El Dorado County was over $8.8 billion in 2008, a 10 percent increase from the previous year. When income was adjusted for inflation, the increase was 6 percent. Adjusted personal income is expected to increase to over $9.4 billion by 2020. This projection indicates an economy that is steadily growing, with a consumer driven market that will gain spending power going forward. As the following figure shows, total personal income in El Dorado County has followed a similar rate of change to the statewide average since 1991.

Total Personal Income

4.2 Components of Total Personal Income

Overview

According to the U.S. Department of Commerce, total personal income can be broken down into the following five major categories shown in this indicator: earnings by place of work; dividends, interest, and rent; personal contributions for social insurance, adjustment by place of residence, and transfer payments.

Understanding how income is earned in the community can shed light on the structure of the local economy. If a greater proportion is in earnings by place of work, then industry performance is driving economic growth. If there is a greater proportion of adjustment by place of residence or of transfer payments, then people living in the community are importing income into the area, which means that the community's economic performance may be driven by factors currently outside the area's influence. A negative adjustment by place of

residence typically means that the community is not providing enough opportunities to house people working in the community in terms of price, availability, or quality.

El Dorado County

Approximately 43 percent of the income of El Dorado County residents came from earnings by place of work in 2008. Another 17 percent of income in the county came from dividends, interest, and rent, and 12 percent came from transfer payments. There was a 33 percent adjustment for residence in the county in 2008, indicating that a large number of residents commuted outside of El Dorado County for work; therefore, wages earned by those persons were a part of the county's total personal income, but were not earned there.

Earnings by place of work is the total income earned from jobs located in a given county. Based on business tax returns, these earnings can be wages, salary disbursements, other labor income, or proprietor (the owner's) income earned within the county regardless of the employee's place of residence.

Dividends, interest, and rent are various types of returns on investments. These include payments by corporations, located at home and abroad, to U.S. resident stockholders, as well as monetary and/or imputed interest received by individuals, nonprofit institutions, estates, and trusts. An individual's income from real property rentals and royalties received from patents, copyrights, and rights to natural resources is also included.

Personal contributions for social insurance are a component of earnings, but not a component of income because the income is counted when the social insurance is received as a benefit, such as Social Security payments, rather that when it was earned. In other words, contributions are taken out of a paycheck prior to disbursement. Therefore, as a component of personal income, this measure is always negative. These contributions include payments made by employers, employees, the self-employed, and by other individuals to programs. In addition to Social Security, payments include those to the Federal Deposit Insurance Corporation (FDIC) and Medicare.

Adjustment by place of residence is made so that total personal income is an indicator that reveals income by place of residence instead of by place of work. This is helpful when evaluating the economic well-being of people who live and work within the county, not counting commuters. Positive residence adjustments indicate that more people live in the county and work outside the county. Negative residence adjustments indicate that more people work in the county, but live outside of it.

Transfer payments are compensations for work not immediately performed. They include payments made by government and businesses to individuals and nonprofit institutions. Transfer payments include a wide variety of payments that are described in the following indicator.

4.3 Components of Transfer Payments

Overview

Transfer payments are a component of total personal income. They are payments made by the government or a business to an individual or nonprofit institution. The payment cannot be compensation for current work, or else it would be considered earnings. Returns on investments, such as dividends, interest, and rent, are not considered to be transfer payments. Transfer payments can be broken down into the following nine major categories:

Understanding the routes through which transfer payments are being distributed to individuals in the community can further understanding about the structure of the economy. If a greater proportion of payments are from retirement and medical payments, then retirees are a relatively important part of the economy. If the greater proportion is in income maintenance and unemployment insurance payments, then there may be some social issues affecting employment growth within the community.

El Dorado County

In El Dorado County, retirement and disability insurance benefit payments accounted for 44 percent of total transfer payments in 2007, compared to 32 percent in California. Medical payments made up the next largest portion with 39 percent of total transfer payments, and saw the highest increase (472 percent) between 1990 and 2007. A similar trend occurred throughout the state, with medical payments increasing 419 percent. Total government payments to individuals in El Dorado County accounted for 51 percent of all transfer payments in 2007, compared to 64 percent in California.

Retirement and disability insurance benefit payments include the Old Age, Survivors and Disability Insurance (OASDI), commonly known as Social Security, and a variety of other programs, such as federal, state, and local government employee retirement benefits.

Medical payments include Medicare, Medicaid, and the Civilian Health and Medical Plan of the Uniformed Services program (CHAMPUS) payments.

Income maintenance benefit payments include SSI, TANF, CalWORKs, food stamps, and other income supplements.

Unemployment insurance benefit payments include state, federal, veteran, and other unemployment compensation.

Veteran benefit payments include veteran pensions, life insurance, educational assistance, and other payments to veterans and their survivors.

Federal education and training assistance payments include payments to nonveterans in the form of fellowships, loan interest subsidies, educational grants, and Job Corps payments.

Other payments to individuals include Indian affairs payments, compensation to survivors of fallen public safety officers and victims of crime or disaster, compensation for Japanese internment, and other special payments to individuals.

Payments to nonprofit institutions consist of the payments made by the federal government, state governments, local governments, and businesses to nonprofit organizations that serve individuals. These payments exclude federal government payments for work under research and development contracts.

Business payments to individuals include any payments to nonemployees and consist largely of personal injury liability payments to individuals.

4.4 Per Capita Income

Overview

Per capita income is calculated by the Bureau of Economic Analysis using its total personal income and the Census Bureau's population estimates. It is defined as total personal income divided by total population. It is one of the primary measures of economic well-being in a community. Changes in per capita income can indicate trends in a county's standard of living, or the availability of resources to an individual, family, or society. Per capita income tends to follow the business cycle, rising during expansions and falling during contractions.

It is important to evaluate per capita income growth against inflation. Growth in excess of the inflation rate indicates real per capita income growth. If growth is less than the rate of inflation then real per capita income levels are falling.

It is also important to evaluate relative per capita income with cost of living differentials. This comparison is reflected in the inflation-adjusted figures seen here.

El Dorado County

The nominal per capita income in El Dorado County in 2008 was $49,187 or 9.1 percent more than the previous year. When adjusted for inflation, the increase was 5.1 percent between 2007 and 2008. Inflation adjusted per capita income is expected to rise to $47,269 by 2030.

Per Capita Income

Year	Current-dollar per capita income (thousands)	1-year change	Inflation-adjusted per capita income (thousands, 2004$)	1-year change

4.5 Median Household Income

Overview

Median household income is the income level at which half of the area's households earn more and the other half earn less. It can be conceptualized as the income midpoint. It is measured every ten years and estimated annually by the U.S. Census Bureau.

Median household income is a better measure of average income than per capita income when evaluating income growth among all economic classes. Changes in per capita income may be driven by growth increases in the high income ranges only, whereas growth in median household income indicates expansion across the full range of incomes.

El Dorado County

The total nominal median household income in El Dorado County in 2008 was $67,019 very compatible to the $61,017 average in California in the same year. El Dorado County's median household income has been higher than the state average since 2000, indicating that its residents have more spending power than the average Californian.

Median Household Income (Nominal)

Year	County	California
2000	$ 52,155	$ 46,836
2001	$ 51,861	$ 47,064
2002	$ 53,182	$ 47,323
2003	$ 54,131	$ 48,440
2004	$ 56,629	$ 49,894
2005	$ 62,199	$ 53,627
2006	$ 67,605	$ 56,646
2007	$ 64,256	$ 59,928
2008	$ 67,019	$ 61,017

4.6 Poverty Rate

Overview

Poverty is a situation where people do not earn enough income to achieve a basic standard of living considered acceptable by society. Measurement of poverty is challenging in general because an assumption must be made about the standard of living society considers acceptable. The U.S. Census Bureau measures poverty as that level of income where a household is able to live in a community with an average cost of living and spend no more than 30 percent of their income on basic food items and 35 percent on basic housing. This measure is controversial because of disagreements over the assumed standard of living and the higher average cost of living in some areas, especially in California.

Poverty status is defined for each household; either everyone or no one in the household is in poverty. The characteristics of the household used to determine poverty status are: number of people, number of related children under 18, and whether the primary householder is over age 65. If a family's total income is less than the poverty threshold, then that family is considered to be impoverished. The poverty thresholds do not change geographically, but they are updated annually for inflation using Consumer Price Index (CPI-U). The official poverty definition includes money income before taxes and does not include capital gains or noncash benefits, such as public housing, Medi-Cal, or food stamps.

Poverty is not defined for people in military barracks, institutional group quarters (such as prisons or nursing homes), or for unrelated individuals under the age of 15, such as foster children.

A high poverty rate in an area can indicate social issues within the community. It may also indicate a scarcity of available employment. The poverty rate also affects such indicators as educational attainment and cost of living.

El Dorado County

The average poverty rate in El Dorado County in 2008 was 7.8 percent, well below the statewide average of 13.3 percent. The poverty rate throughout California as a whole has remained relatively constant between 2000 and 2008, increasing less than 1 percent. El Dorado showed a decrease of 0.4 percent between 2007 to 2008. This is certainly a positive trend for the county, and indicates a healthy and growing economy.

Poverty Rates

Year	County	California
2000	7.3 %	12.7 %
2001	7.3 %	12.9 %
2002	7.1 %	13.3 %
2003	7.5 %	13.7 %
2004	6.9 %	13.2 %
2005	7.4 %	13.3 %
2006	7.6 %	13.1 %
2007	8.2 %	12.4 %
2008	7.8 %	13.3 %

4.7 Business Taxable Sales

Overview

The taxable sales indicator is the value of all transactions subject to sales and use tax in California. Collected and published by the California Board of Equalization, sales and use taxes are imposed on the sale and use of tangible personal property. Total taxable sales do not necessarily reflect the gross sales of retail businesses because not all transactions are subject to sales and use tax, including nonprepared food items, prescription medicines, and services, whether or not the service is tied to the sale of a taxed product.

Taxable sales generate a substantial amount of income for local and state governments; however, rather than reflecting the revenue earned by a local government, taxable sales act as a gauge for consumer spending and local economic performance. Compared with total population, this is a helpful indicator for retail businesses to measure the potential for sales volume in a certain area. Changes in taxable sales are a measure of changes in both local government revenue and the economic health of the area.

NOTE: There is a lag time of one year and one quarter in the availability of the following data.

Total Taxable Retail Sales and Total Taxable Sales (Thousands)

Year	Taxable retail sales	Total taxable sales
1997	$ 701,638	$ 1,011,222
1998	$ 711,083	$ 1,041,654

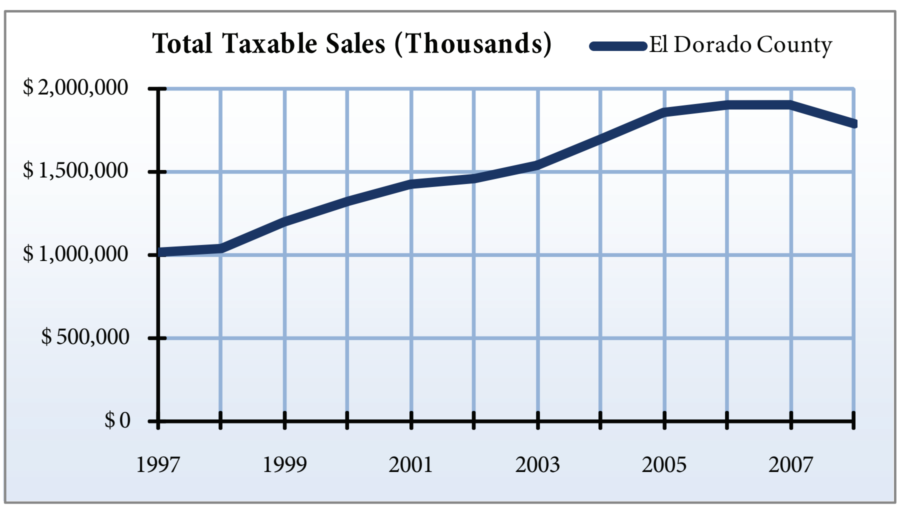
El Dorado County

In 2008, total taxable sales in El Dorado County were almost $1.8 billion, and retail sales made up 69 percent of that total. Retail sales made up 71 percent of total taxable sales in California in 2008. Between 1998 and 2008, the city of South Lake Tahoe saw a 32 percent increase in total sales, while the city of Placerville saw a 39 percent increase. As the following figures show, El Dorado County's total taxable sales have matched similar statewide trends in the last decade.



Total Taxable Sales (Thousands)

Year	Placerville	South Lake Tahoe
1997	$ 188,769	$ 254,153
1998	$ 195,982	$ 257,592

4.8 Earnings by Industry

Overview

Earnings by industry is the total personal earnings from jobs in individual industries. It is not equivalent to the total revenue a business generates. The total earnings of an industry are calculated by taking the sum of three components: wage and salary disbursements, supplements to wages and salaries, and proprietor income.

Earnings by industry serves as a proxy and allows comparisons between industries or geographic areas because sales by industry are not reliably available at the county level.

Growth in earnings by industry can provide some insight into the relative competitiveness of an industry in a local economy, as well as which industries have the potential for expansion. For example, if the proportion of an industry's earnings is higher than in the state, then there is likely a competitive advantage to that industry's location in the county. Locations where an industry has a competitive advantage and/or has been growing rapidly in the past may have greater potential for expansion in the near future.

NOTE: (D) Figure not shown to avoid disclosure of confidential information, but the estimates for this item are included in the totals.

El Dorado County

The construction sector, and the government and public administration sector earned totals of $563 million and over $639 million, respectively, in the same year.

Within the services sector, professional, scientific, and technical services earned the highest reported total, with over $469 million in 2008. Health care and social assistance services followed with $412 million in earnings in the same year.

Earnings by Industry (Millions)

Industry	2001	2002	2003	2004	2005	2006	2007	2008

5. Agriculture

In certain areas of Northern California, agricultural production constitutes a significant portion of the economic base. The relative importance of agricultural production in an area affects the volatility of the local economy and determines what businesses are successful. Areas particularly dependent on a few agricultural crops can experience considerable instability in their economic performance as commodity prices fluctuate. In addition, seasonal unemployment is more pervasive in economies with a large agricultural sector, raising the average annual unemployment rate.

All information for this section was collected from the California Agricultural Statistics Service. It should be noted that the California Agricultural Statistics Service compiles data from each county's agricultural commissioner, who in turn collects data from farmers. In some cases, crops are classified under varying titles from year to year and deadlines are not always met for reporting information; therefore, some discrepancies exist in historical data and no crop specific historical data was analyzed in this section.

.

In this section:

5.1 Harvested Acreage

Overview

Total harvested acreage is the amount of land that is harvested for agricultural products in a given year. This includes field crops, vegetable crops, seed crops, with pasture and rangeland included. Harvested acreage can fluctuate due to flooding, severe storms, fields that are left fallow for a season, government programs and regulations, pest control, and other factors. The county agricultural commissioner collects this data and reports it to the California Department of Food and Agriculture.

A decline in agricultural land availability may indicate urban expansion, a permanent removal of land from the production cycle. In some cases, crop types such as vines and orchards must grow for three to four years before being harvested, creating a cyclical pattern in harvested acreage. Therefore, evaluation of long-term patterns is more revealing than year-to-year comparisons.

NOTE: Estimates of harvested acreage can fluctuate primarily due to fluctuations in range pasture acreage. New county agricultural commissioners sometimes employ different methods for estimating range pasture than their predecessors.

El Dorado County

A total of 237,399 acres of land considered was harvested acreage, including pasture in El Dorado County in 2008, which accounts for 21.7 percent of the land area in the county and 1 percent of the total harvested land in California. Pasture for rangeland made up 98.1 percent of harvested acreage in the county. See the following illustrations for more detail on the county's harvested acreage by year, harvests of the most important crops, as well as rangeland.

Wine grapes were the dominant harvested crop in El Dorado County, with 1,901 acres harvested in 2008. This accounted for 0.2 percent of all wine grapes harvested in California. Bartlett pears comprised only eighty-four acres of harvested land in the county, yet accounted for 0.4 percent of the California total. Apples made up the next most abundant harvest, with 845 acres in 2008, or 3 percent of the state total.

Total Harvested Acreage

Year	Total Acres Harvested	Percent of Total Land Area

5.2 Value of Agricultural Production

Overview

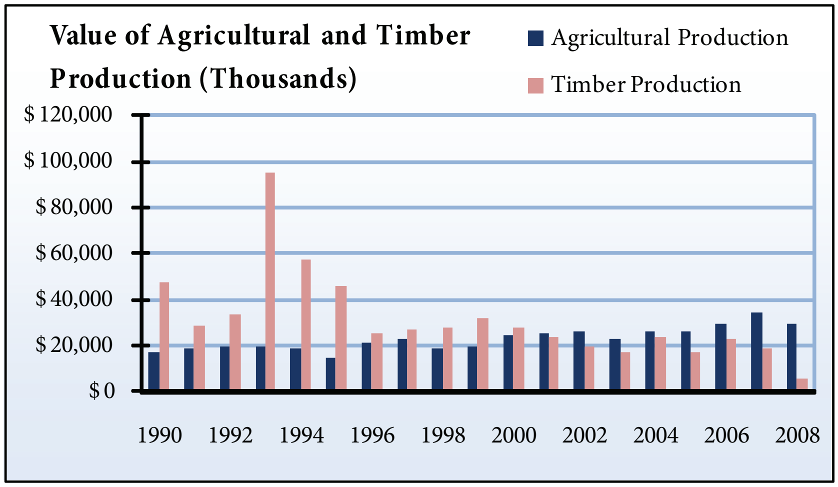
This is the total value of agricultural products producedThis is the total value of agricultural products produced in the county. The products do not have to be sold to be counted in the value of production. The data on crop production and prices is estimated by the county agricultural commissioner and reported to the California Department of Food and Agriculture. Included are the ten most important crops in the area, classified in terms of gross production value.

Agricultural production affects many aspects of a county's economy, including jobs, income, and the economic output of related industries. When agricultural production declines, so do purchases from some local businesses. Not all crops have the same impact on local employment and income. Increasing values of agricultural production is generally associated with higher local income.

El Dorado County

Total agricultural production totaled over $35 million in El Dorado County in 2008, a decrease of 34 percent from 2007.

The decrease in total production had a lot to do with the 87% decrease in timber production since 1990. Decreasing timber production is a consistent trend across northern California.



Agricultural and Timber Production (Thousands)

Year	Agricultural Production	Timber Production	Timber as a Percent of Total Production	Total Production
1990	$ 16,814	$ 47,456	73.8 %	$ 64,270
1991	$ 18,819	$ 29,035	60.7 %	$ 47,854
1992	$ 19,902	$ 33,784	62.9 %	$ 53,686
1993	$ 19,467	$ 95,521	83.1 %	$ 114,988
1994	$ 18,869	$ 57,355	75.2 %	$ 76,224
1995	$ 14,872	$ 45,800	75.5 %	$ 60,672
1996	$ 21,567	$ 25,676	54.3 %	$ 47,243
1997	$ 23,193	$ 27,050	53.8 %	$ 50,243

5.3 Top Crops by Value

Overview

This section includes the top ten agricultural products in the county in terms of gross production value. Gross production value is measured for the calendar year and includes what is sold on the market and the portion used on the farm. The information is collected by the County Agricultural Commissioner, who in turn reports the data to the California Department of Food and Agriculture.

High prices and stable prices are important for agricultural producers and the local economy dependent on agriculture. When prices are too low or fluctuate excessively, profitability cannot be guaranteed and local production may weaken.

El Dorado County

Cattle and calves generated over $5.8 million in 2008, accounting for 19 percent of total agricultural production.

The production of apples, the most valuable crop in El Dorado County, generated over $5.8 million and made up 20 percent of the county's total agricultural value in 2008. The next most valuable crop in the county were wine grapes, with a value of $5.2 million in 2008, or 18 percent of the county's production value. Both wine grapes and apples are extremely important to the local economy of the county because their successful harvest contributes to the livelihood of the farming community.

Pasture for rangeland and cattle are also highly valuable in El Dorado County, as well as Christmas trees and nursery products. Please see the graphs for illustrations of El Dorado County's agricultural production value.

Top Crops by Value, 2008

Crop	Value
Apples, All	$ 5,845,500
Cattle & Calves Unspecified	$ 5,431,500
Grapes Wine	$ 5,229,100
Pasture Range	$ 2,796,000
Christmas Trees & Cut Greens	$ 2,520,300
Nursery Products Misc.	$ 1,560,000
Pears, Asian	$ 1,422,700
Livestock Unspecified	$ 1,254,800
Pears, Bartlett	$ 676,400
Apiary Products Bees Unspecif	$ 650,000

5.4 Total Farm Revenue

Overview

Farm revenue is derived by the U.S. Department of Commerce from annual income tax returns delivered to the Internal Revenue Service. It is a tabulation of income from farms filing taxes in the county.

Farm revenue is what links agricultural production to economic impact in the county. The value of production may not include products sold, or income to local farmers. Production value also does not include government payments or other subsidies that would not be seen in the county if county farms did not exist.

El Dorado County

Although agricultal production was down significantly in 2008, total farm revenue exceeded $30 million for the first time in 2008. The average annual growth rate in farm revenue since 1990 is 6.6 percent. Most revenue comes from crop sales with a significant portion (about 24 percent) from miscellaneous income. Less than 1 percent of farm revenue comes from government payments.

Total Farm Revenue (Thousands)

Year	Cash Receipts from Livestock and Products	Cash Receipts from Crops	Government Payments	Miscellaneous Income	Total Revenue
1990	$ 3,207	$ 5,922	$ 0	$ 2,009	$ 11,184
1991	$ 4,111	$ 6,023	$ 0	$ 2,137	$ 12,297
1992	$ 3,511	$ 6,906	$ 68	$ 1,842	$ 12,327
1993	$ 4,030	$ 6,803	$ 76	$ 1,962	$ 12,871
1994	$ 3,254	$ 6,908	$ 69	$ 1,644	$ 11,875
1995	$ 2,673	$ 5,837	$ 53	$ 1,507	$ 10,070
1996	$ 2,691	$ 9,643	$ 0	$ 1,803	$ 14,164
1997	$ 4,058	$ 11,016	$ 0	$ 1,818	$ 16,912

6. Housing & Real Estate

In this section, we explore issues regarding housing and real estate. This includes how economic activity affects housing and real estate markets and how housing and real estate affect the local economy.

Generally, housing stock keeps pace with population, although in an economy that is intricately linked with those of surrounding counties, growth in housing stock can drive growth in population, rather than population changes the housing stock. Therefore, housing built locally often satisfies a regional demand. However, it is important for a community to allow the construction of housing to meet local demand as well. Not meeting this need can result in rapid increases in home prices. That said, home price increases, and most recently, price declines, are attributable to the housing bubble and its subsequent burst. Currently, home prices are more affordable than they have been in at least a decade.

Non-residential construction and real estate followed a similar, but lagging path. Commercial building was not originally affected by the housing bubble burst, although a lack of residential construction eventually resulted in a severe reduction in commercial construction because the local retail and service market failed to grow as quickly as in the past. Vacancy rates for retail have more than doubled the past few years, while vacancy for office and industrial space has increased significantly as well.

In this section:

6.1 Total Housing Units

Overview

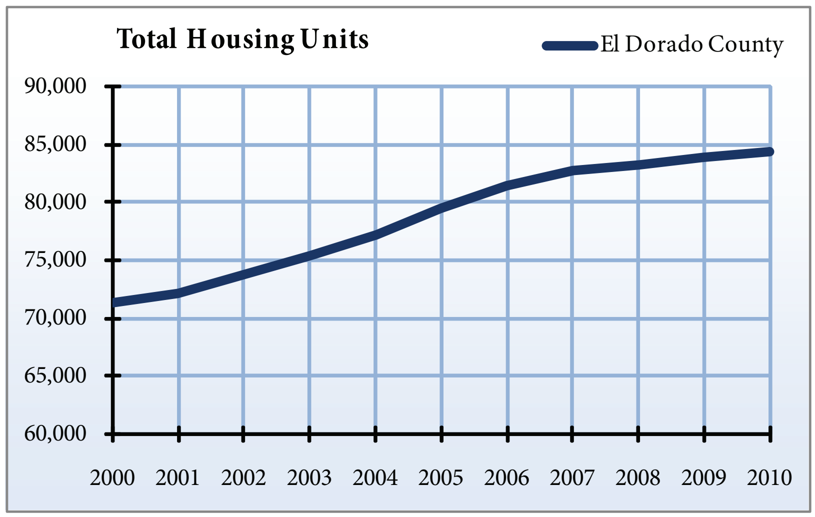
Total housing units is the number of single- and multiple-family dwellings, mobile homes, and other dwelling units located within a given jurisdiction. A housing unit may be the permanent residence for a family, a seasonal or second home, or it can be vacant. Occupancy may be by a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements. The number of housing units is estimated annually by the California Department of Finance and the department uses this data to estimate population change (section one).

Growth in the number of housing units typically keeps pace with population growth. A disparity between housing and population growth indicates something about a community. Housing growth without population growth may indicate an increase in the number of second homes in the community. Population growth without housing growth may result in a housing shortage and an increase in home prices, affecting housing affordability and the overall cost of living.

NOTE: The California Department of Finance uses the decennial census as a base for estimating total housing units. The estimates are produced by adding new construction with annexations and subtracting demolitions from the census benchmark.

El Dorado County

The total number of housing units in El Dorado County increased at an average annual rate of 1.7 percent between 2000 and 2010, compared to 1 percent in California. Single-family units have increased the most in the county, with a 20 percent increase since 2000. In 2010, about 82 percent of single-family units and 82 percent of mobile homes are outside



County Total Housing Units

Year	Single-family units	Multiple-family units	Mobile Homes	Total Housing Units	Annual percent change
2000	58,692	8,213	4,373	71,278	n/a
2001	59,488	8,367	4,373	72,228	1.3 %
2002	60,974	8,444	4,373	73,791	2.2 %
2003	62,510	8,452	4,374	75,336	2.1 %

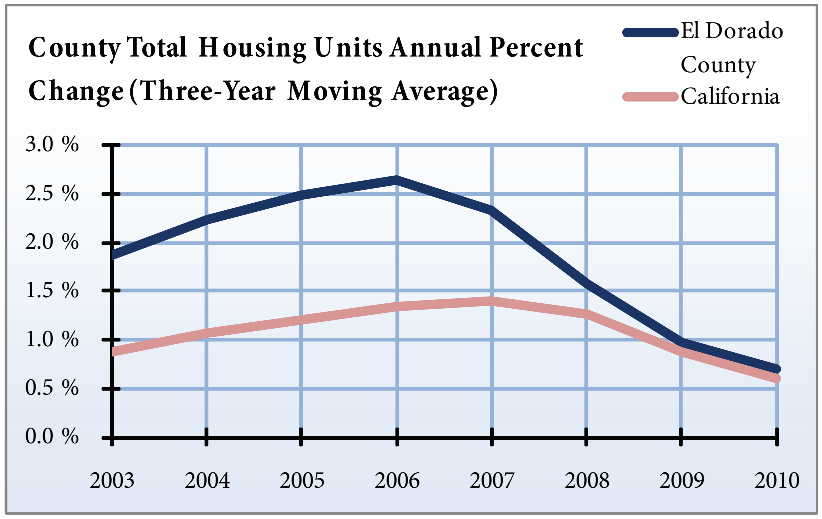
city limits, while the majority of multiple-family units are within the county's incorporated areas.

The city of South Lake Tahoe had 14,450 total housing units in 2010, the largest amount in the county, and yet the city has only had an annual average increase of 0.3 percent over the last ten years. Placerville has had an average annual increase in total housing units of 1 percent over the last decade.



According to the California Construction Industry Research Board, single-family units include the following:

-Disconnected or detached units that stand apart from other units

-Semi-detached units that are attached to another unit on one side only

-Row houses and townhouses that are separated unit by unit by an unbroken ground-to-roof partition or firewall

-Condominiums are considered single-family units if they include the following:

-A zero-lot-line or zero-property-line construction (these terms can be used interchangeably referring to a lot that has no side yard but extends to the property line)

-A dividing line that separates two or more lots for the purpose of maintenance, repair, improvements, and reconstruction of the original dwelling

-Each unit is separated by an air space

-The units are separated by an unbroken ground-to-roof partition or firewall

Multi-family units include the following:

-Duplexes Three- to four-unit structures

-Apartment structures (with five or more units)

-Condominiums that do not meet the single-family definitions

6.2 New Housing Units Authorized by Building

Overview

A building permit is required for all new construction. A permit may allow one or more homes in a subdivision. The number of housing units authorized by building permits is the primary factor used to calculate the changes in total housing units. The data is collected by every city and county, then reported to and disseminated by the California Construction Industry Research Board.

The number of building permits typically indicates building activity in the near future, either during the year the permit was issued or the next. An increase in the number of building permits issued indicates expansion in construction sector activity. That expansion may be a response to any number of factors including falling mortgage interest rates, economic growth, or the expectation of rising housing prices due to housing shortages or speculative activity.

El Dorado County

An average of 1,432 new housing units have been authorized by building permits each year in El Dorado County between 1999 and 2009. During that same time, there was an average annual decrease of over 20 percent in new housing permits and a 2 percent increase in population. In comparison, California saw a 13 percent annual average decrease in housing permits, and a 1.4 percent average annual increase in population during the same time.

Between 1999 and 2009, there have been an average twenty-nine new single-family and sixteen multiple-family unit building permits each year in Placerville. In South Lake Tahoe, there were an average fourty-seven single-family and thirteen multiple-family unit permits during the same period of time. The combination of permits in these two cities accounted for 17 percent of the county total in 2009. This means that most of the construction of new housing units took place in unincorporated areas in El Dorado County that year, while 100 percent of new multiple-family units are in the City of Placerville.

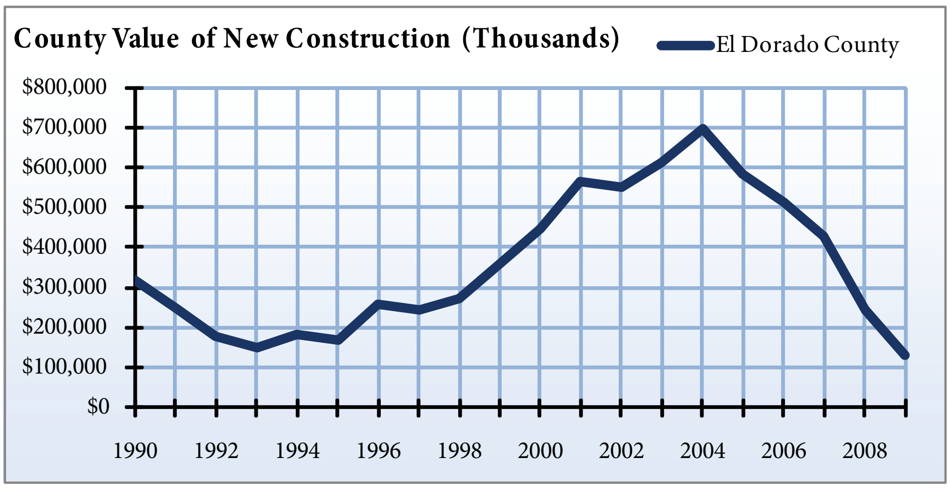
6.3 Value of New Construction (Building Permit Valuation in Dollars)

Overview

Building permits are required for all new construction, not just housing units as shown in the previous section. Permits are required not only for new commercial and industrial construction, but also for the demolition, remodeling, expansion, additions, and repairs made to existing residential, commercial, and industrial structures.

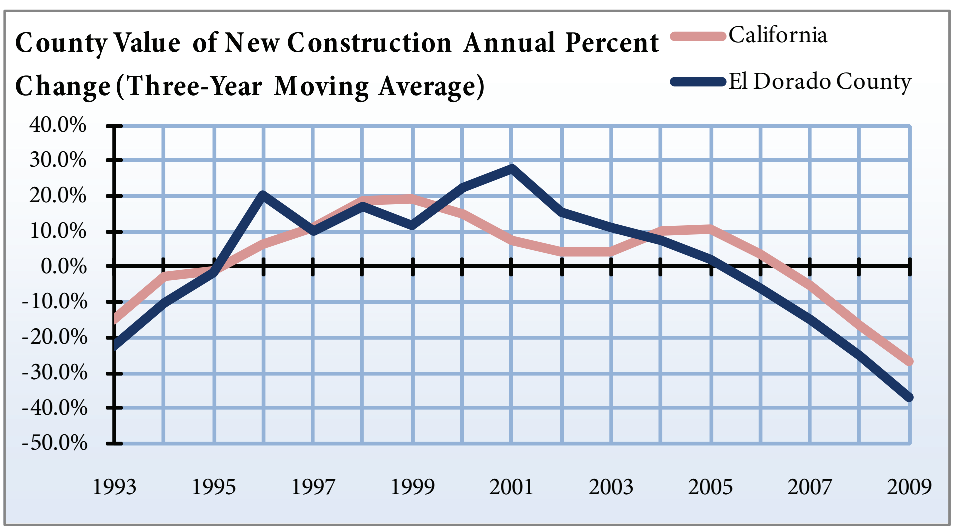
The value of new construction in this section is the total value reported in building permits. This often understates the true value of construction because many development impact fees are based on the value of permitted construction, giving builders an incentive to underestimate the cost of the completed structure. The valuation estimate is based on costs that include labor, materials, and architectural and engineering expertise.

Residential units are single-family and multi-family units, and typically account for about half of all permitted construction valuation.



Major components of nonresidential construction include commercial offices, commercial stores, other commercial, industrial buildings, and other construction

This section excludes public buildings when a building permit is not necessary for construction. This usually includes public schools and local government buildings.



The value of construction activity, especially of commercial and industrial buildings, is one of the primary indicators of economic expansion. It indicates economic investment in the community for which the investor is expecting a return. Because the building may not be complete and operational until the next year, building activity is often a leading indicator of near-term economic growth.

El Dorado County

The value of new construction decreased 10 percent on average each year between 1999 and 2009 in El Dorado County. California saw an average annual decrease of 6 percent the same time period. In 2009, single-family units made up 39 percent of all new construction value in the county, while multiple-family units made up less than 1 percent. Total commercial and industrial construction accounted for 9 percent of the total value in the county in the same year. The city of South Lake Tahoe had the highest new single-family unit valuation at $6 million, followed by the city of Placerville at over $726 thousand.

County Value of New Construction (Thousands)

Year	Single-family units	Multiple-family units	Residential alterations	Comml. offices	Comml. stores	Other Comml.	Industrial	Other construction	Non-residential alterations	Total valuation

6.4 Fair Market Rent

Overview

Fair market rent acts as a proxy for monthly rent values. It is calculated by the U.S. Department of Housing and Urban Development using surveys of privately-owned dwellings with standard sanitary facilities. Fair market rent is set at the fortieth percentile, which means that 40 percent of the units in a given area pay less than the fair market rent and 60 percent pay more. It is calculated for various numbers of bedrooms in the house or apartment. Fair market rental values are gross rent estimates and they include shelter, rent, and the cost of utilities, except telephone.

Most wealthy households can afford a home. Fair market rent is an indicator of housing costs for poorer households in a county and is used to determine whether families or individuals qualify for rent and utility assistance. Fair market rent figures are descriptive of the local rental housing market in the region and are useful for individuals or businesses contemplating a move to the area.

Fair market rent also allows community leaders to evaluate the adequacy of the supply of rental housing in the community by calculating how much a household must earn to afford a certain type of unit. A rental unit is defined as affordable if rent plus utilities is not more than 30 percent of income.

El Dorado County

From 2009 to 2010, El Dorado County rent prices consistently increased between 1.6 percent and 1.7 percent regardless of the number of bedrooms. Between 2000 and 2010, county rent prices increased on average approximatley 54 percent.

7. Travel & Tourism

People travel away from home for many reasons, including business, pleasure, and other personal reasons. A traveler is considered to be anyone who spends time in a community other than the one in which they reside, whether it is a day trip or an overnight stay. Many areas of Northern California rely on visitor spending as a significant part of the economy. This section presents data on travel to El Dorado County including data resulting from tourism and daily commutes. Estimates of the economic impacts of tourism travel are also presented in this section, including sales, income, and employment.

Tourism in El Dorado County is important due to a number of attractions in the area, including wilderness areas, camping, hiking, and fishing opportunities.

In this section:

7.1 Travel Expenditures

Overview

Every year, the California Travel and Tourism Commission hires Dean Runyan Associates on contract to estimate the impacts of travel spending by county in California. Dean Runyan specializes in economic and market research related to travel, tourism, and recreation. They are on contract with ten U.S. states to produce travel spending estimates.

Travel and tourism spending includes all purchases made by a traveler at the point of sale while visiting a county. Travelers include those making day trips, staying overnight, and people just passing through (buying gasoline, etc.). The travel can be for any reason, including but not limited to recreation, business, personal, and family visits.

Travel expenditures is the base indicator for evaluating the impacts of travel and tourism in El Dorado County. It is an estimate from which the following three important indicators are calculated.

El Dorado County

Over the past few decades, the travel and tourism industry has been responsible for a steady rise in the amount of money spent in California. Total travel expenditures in California in 2008 reached $97.5 billion, a 3 percent increase from the previous year. Travel expenditures in El Dorado County decreased by 1 percent in the same year, to $604.3 million. Between 1992 and 2008, El Dorado County was respon-sible for an annual average of 0.7 percent of all travel expenditures in California.

Total Annual Travel Expenditures by County and State (Millions)

Year	Expenditures in County	Annual percent change	Expenditure in California	Annual percent change
1992	$ 425.0	n/a	$ 50,700	n/a
1993	$ 438.1	3.1 %	$ 51,600	1.8 %
1994	$ 449.8	2.7 %	$ 52,600	1.9 %
1995	$ 455.7	1.3 %	$ 54,200	3.0 %
1996	$ 462.1	1.4 %	$ 58,900	8.7 %
1997	$ 484.4	4.8 %	$ 64,100	8.8 %
1998	$ 502.1	3.7 %	$ 66,500	3.7 %
1999	$ 528.1	5.2 %	$ 70,900	6.6 %

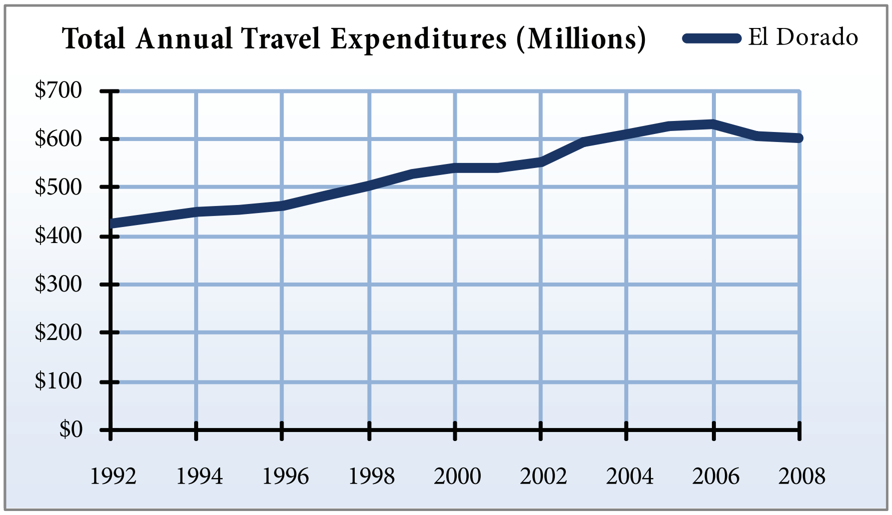
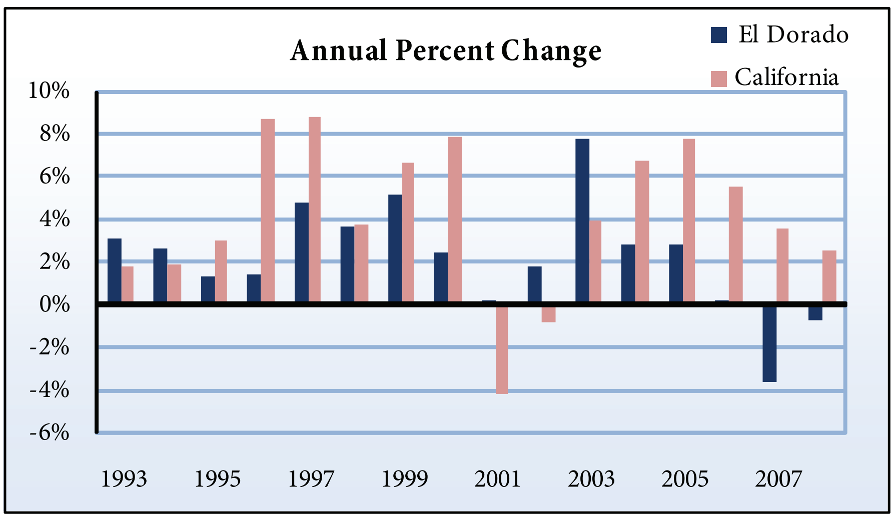
2004	$ 611.9	2.8 %	$ 80,700	6.7 %
2005	$ 629.4	2.9 %	$ 87,000	7.8 %
2006	$ 631.0	0.3 %	$ 91,800	5.5 %
2007	$ 608.5	- 3.6 %	$ 95,100	3.6 %
2008	$ 604.3	- 0.7 %	$ 97,500	2.5 %

Source: California Travel and Tourism Commission, Dean Runyan Associates

Created by: Center for Economic Development, California State University, Chico





The expenditures shown in the graph are estimated in current dollars and include the following:

Accommodations refer to spending by travelers on lodging in hotels, motels, camping sites, and rented vacation homes.

Eating/drinking refers to purchases made by travelers at restaurants and other businesses that serve food and beverages for consumption on the premises.

Retail sales refer to spending by travelers on gifts and souvenirs, or any items other than food and recreation.

Transportation refers to spending by travelers for travel arrangements to and from their destinations.

Recreation refers to spending by travelers for amusement and enjoyment, such as admission to tourist attractions.

7.2 Travel-Generated Employment

Overview

The employment indicator is an estimate of the number of jobs generated in the county from travel spending shown in the previous indicator. Travel generated employment is spread across nearly all industries evaluated by the U.S. Department of Commerce. Travel-generated employment is the impact of travel spending on jobs and job growth in the county. It is a measure of the benefit to workers.

Travel and tourism can play a vital role in the economy and economic growth of small towns, particularly those in Northern California dependent on visitors to wine country. It is a source of jobs for many otherwise less-skilled or -educated workers in the county.

El Dorado County

Travel-generated employment produced 8,500 jobs in El Dorado County in 2008, accounting for 9 percent of the total employment in the county. Between 2002 and 2004, El Dorado County experienced increases in travel-generated employment, but over the last four years employment has decreased. Between 1998 and 2008, El Dorado County was responsible for an annual average of 1 percent of the total travel-generated employment in the state.

Total Travel-Generated Employment (Thousands of Jobs)

7.3 Total Annual Travel Earnings

Overview

Earnings listed in this indicator are an estimate of the amount of personal income generated from the jobs shown in the previous indicator. As with employment, the earnings indicator represents those in nearly all industries evaluated by the U.S. Department of Commerce. Total annual tourism earnings are all the earnings of employees and business owners over the course of a year that can be attributed to travel expenditures, including wages and salaries, earned benefits, and proprietor income. Other earnings that do not directly relate to travel are excluded.

Tourism earnings measure the personal financial benefit of travel and tourism in El Dorado County. If earnings are increasing faster than the number of jobs, then travel and tourism jobs are generating higher wage jobs or the work season (if employment is seasonal) is expanding.

El Dorado County

El Dorado County's tourism industry generated $224.8 million in 2008, which is a 1 percent decrease from the previous year, and $42.1 million more than the county generated in 1998. Statewide, tourism earnings increased 2 percent in 2008. Between 1992 and 2008, El Dorado County's tourism earnings made up an annual average of 0.8 percent of all the tourism earnings in California.

NOTE: Data prior to 1997 was not revised by Dean Runyan and Associates to include NAICS revisions at the time of writing. Therefore, data may not be comparable to previous years. Please contact the CED for any available updates in the near future.

7.4 Tax Revenues Generated by Travel Expenditures

Overview

The tax revenues indicator is an estimate of revenue generated by local government from travel expenditures shown earlier in this section. The revenue can be in the form of taxes, fees for service, fines, or any other source. The totals are not limited to general revenue, which can be spent at the discretion of the local governmental jurisdiction, but also include functional revenue that must be spent for a specific purpose.

Tax Revenues Generated by Travel Expenditures, County and State (Millions)

Year	Local rax revenues	State tax revenues	Total tax revenues	County Annual percent change	California Annual percent change
1992	$ 9.7	$ 14.7	$ 24.4	n/a	n/a
1993	$ 10.1	$ 15.1	$ 25.2	3.3 %	2.3 %
1994	$ 10.4	$ 15.4	$ 25.8	2.4 %	3.7 %

Local sales taxes and transient occupancy taxes (TOT) are typically the largest components of tax revenues generated by travel expenditures. This represents a portion of the revenues generated by sales of taxable items shown in section six.

Tax revenues generated by travel expenditures are a measure of the fiscal benefit to local governments in El Dorado County that is derived from travel and tourism. The size of the revenue impact can help determine the desirability of local government investment in promoting travel and tourism within its jurisdiction.

El Dorado County

Tourism tax revenues in El Dorado County decreased each of the last 2 years. In 1997, El Dorado County generated over $27.7 million in tax revenues, including both local and state taxes. By 2008, total tax revenues in El Dorado County increased to $34.6 million, a 19 percent increase since 1998. This was behind the state of California, which saw a 46 percent increase. During the same time period, El Dorado County's travel-generated local tax revenue increased 18 percent, while state tax revenues in the county increased 20 percent. Many attractions in the county offer untaxed goods and services, so the numbers may not reflect the total tourism activity in the county.

7.5 Selected Highway Traffic Volumes

Overview

Traffic volumes on California State Highways are estimated annually and measured on-the-ground periodically by the California Department of Transportation. The data is collected to help the state understand where traffic volume is growing and for planning traffic improvements.

Traffic volume is an indicator of change in economic interconnectivity between regions and communities. Most traffic growth over a ten-year period reflects increases in commute patterns, although other factors include increased shopping trips and commercial traffic.

Average Annual Daily Traffic Volumes

		1999		2009		Percent Change

7.6 Travel Time to Work

Overview

Travel time to work is the amount of time, in minutes, workers estimate it takes them to get to work on a normal workday. Travel time can be influenced by distance to work, traffic levels, and the means of transportation utilized (evaluated in the following indicator). It is measured every ten years by the decennial census.

As the U.S. economy heads toward a broader global market, the dynamics of transportation to and from work change as well. Commuting has become a way of life. People spend an increasing number of hours on the road traveling to and from work, and lose valuable time that otherwise might be spent working, at home, or in the marketplace. In addition, the increasing use of the Internet to conduct business has had an impact on the number of people working from their homes or nearby offices, while the expansion of large businesses in metropolitan areas attracts employees from rural areas. Commuting has had a tremendous effect on local economies, increasing the need for alternative forms of transportation, including public transit.

El Dorado County

For many residents in El Dorado County, commuting to work is a ten- to nineteen-minute drive in a personal car, truck, or van. As of 2000, 19,619 residents in El Dorado County, which is 27.2 percent of total employed residents, commuted to their place of employment in a ten- to nineteen-minute drive, while 15.3 percent faced a commute of twenty to twenty-nine minutes. These were also the two most common commute times statewide. A significant number of El Dorado County residents had much easier commutes, with 9,407 people reporting a commute time of less than ten minutes. This number, which is 13.1 percent of all employed El Dorado County residents, is higher than the 11 percent of workers with similar commutes throughout California.

Travel Time to Work

7.7 Means of Transportation to Work

Overview

Means of transportation to work is the type of vehicle or mode used to get from home to work on work days. As with travel time, it is only consistently measured by the decennial census unless a local survey is conducted during noncensus years.

Commuting is a necessary and regular part of life for most people in the workforce. The means by which the population travels to and from work can be used to analyze the need and importance of public transportation in a county.

El Dorado County

As of 2000, the vast majority of El Dorado County workers, 89.1 percent, got to work via car, truck, or van. Of those residents, 85.1 percent drove alone, compared to 83.2 percent throughout California in 2000. In the county, 14.9 percent of that group carpooled in the same year.

In 2000, 3.1 percent of El Dorado County's employed residents used nonmotorized means to get to work: 0.3 percent rode a bicycle, 2.2 percent walked, and 0.6 percent got to work using some other mode of transportation. Only 1.8 percent of the total number of employed residents in El Dorado County used public transportation of some kind, which can either be attributed to a lack of available public transportation, or a negative connotation associated with it.

Means of Transportation to Work

7.8 Vehicle Registration

Overview

Registration is an annual fee based on vehicle type and required for all vehicles intended for use on the highway or in town. A biennial smog check is required for all gasoline vehicles made made after 1975. Models made before that time are exempt, as well as models made within the last six years, some diesel powered vehicles, motorcycles, hybrids, and electric vehicles.

Vehicle registration, per capit, a has generally increased over time, meaning more cars on the road for every living person. Increasing volume of vehicles can indicate increasing traffic levels, the impacts of which may need to be addressed by state and local government bodies.

The California Highway Patrol (CHP) and the Department of Motor Vehicles (DMV) use vehicle registration fees to offset costs for road safety, maintenance, and repairs. Registration fees also benefit local projects, such as fingerprint identification for children in the community, the disposal of abandoned vehicles, Service Authority for Freeway Emergencies (SAFE), auto theft deterrence/DUI educational prevention tactics, and air quality monitoring and management programs.

Estimated Fee Paid Vehicle Registrations

Year	Autos	Trucks	Trailers	Mortorcycles	Total
1990	81,941	40,362	22,185	3,841	150,319

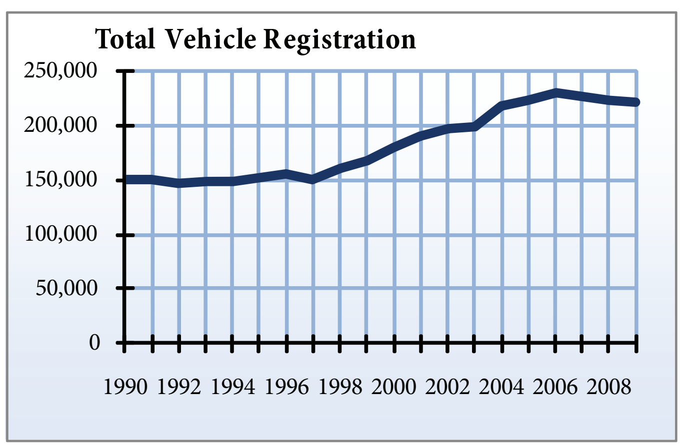
El Dorado County

The number of total vehicle registrations had increased steadily in El Dorado County until reaching a peak of 229,791 in 2006. It has since fallen to 220,799 in 2009. Of these, 121,768 were automobiles, 47,309 were trucks, 41,555 were trailers, and 8,158 were motorcycles. These numbers are expected to rise as more people obtain their driver's license and begin driving in El Dorado County. Because registration fees in certain cases can be more than $400, vehicle registration and



8. Community Health

Health and human service agencies are involved in treating and monitoring the health care needs of the community. Community health indicators measure the success of programs and services that provide access to physical and mental support for the community.

When considering community health indicators, it is helpful to look not only at traditional medical indicators (births, deaths, etc.), but those that measure individual and collective health as well. Individual health may be influenced by a variety of factors, including educational attainment, employment, environmental factors, and even community relations. Other indicators measure the availability, and perhaps the adequacy, of health care services in the area.

Indicators in this section can be linked to issues of unemployment and poverty as poverty can affect a persons ability to recieve adequate health care. Conversley health issues can affect a person's ability to work and improve their standard of living.

In this section:

8.1 Death Rate

Overview

The data is reported by place of residence at the time of death; as long as the decedent was a permanent resident of El Dorado County at the time of death, they are included. Age and race/ethnicity of decedent, place of death, and cause of death, among other characteristics are also reported to the California Department of Public Health.

Death statistics are essential when evaluating public health and generally identifies the degree to which the county has an aging population. This data is used for identifying health issues in the community, and targeting public health programs and services. Age-adjusted death rates are not published by CDPH at the county level.

El Dorado County

1,227 El Dorado County residents died in 2008. The death rate in El Dorado County decreased from 7.1 deaths per 1,000 residents in 1998 to 6.8 in 2008. In comparison, California had a lower death rate of 6.2 deaths in 2008 per 1,000 residents, and it also has a decreasing death rate. A death rate higher than that of California's death rate means either or both of the following are true: the population of the county is much older than that of California's population, or El Dorado County residents have a lower standard of living/health than the California average.

8.2 Birth Rate

Overview

The birth rate is the number of live births that occur for every 1,000 people in the county. The number of births and rate is tabulated by the California Department of Public Health from records of the state's county health departments.

Birth rates indicate the degree to which the population reproduces. High birth rates can indicate a healthier population, although lower birth rates may be due to fewer family-age adults in the community, or a greater propensity for lifestyles that include smaller than average families. Birth rates tend to increase slightly during economic booms and decrease slightly during recessions, although long-term trends in birth rates are not an indicator of long-term economic activity.

El Dorado County

County birth rates are consistently below average compared to the state, which is attributable to the higher senior population of the county. Rates have been declining along with those of the state since 1991.

8.3 Leading Causes of Death

Overview

Each death in the county is reported with certain characteristic information, including age and race/ethnicity of decedent, place of residence at time of death, and cause of death, among other characteristics. This indicator includes data on the ten leading causes of death in California each year, broken out by county. The tables show the number of deaths in El Dorado and in California in order of California's top ten most common causes of death in California between 1999 and 2008.

El Dorado County

The leading cause of death in El Dorado County is cancer, which is the second leading cause of death in the state. The second leading cause of death in El Dorado County is heart disease, California's leading cause of death. In the last ten years, the number of deaths caused by heart disease has fluctuated between 343 with 301 deaths in 2008.

Leading Causes of Death, County

8.4 Infant Mortality

Overview

Infant mortality is used to compare the health and well-being of populations across and within countries.

Infant mortality rates are a subset of total deaths presented earlier in this section and are the sum of infant and neonatal deaths, which are described below:

·**Neonatal death** is a death occurring within the first twenty-eight days of life.

·**Infant death** is a death occurring during the first year of life.

Infant mortality represents many factors surrounding birth, including but not limited to the health and socioeconomic status of the mother, prenatal care, quality of the health services delivered to the mother and child, and infant care. In addition, high infant mortality rates are often considered preventable and can be influenced by various education and care programs.

El Dorado County

There were a total of eight infant deaths in El Dorado County in 2007, an increase of one death from the previous year. In 2002, El Dorado County saw the highest number of infant deaths since 1994.

At the time of data collection the most current data available was from 2007.

8.5 Low Birth Weight Infants

Overview

Births of infants with a low birth weight (less than 2,500 grams, about 5.5 pounds) are reported by the California Department of Health Services as a subset of birth data.

Low Birth Weight Infants, California

Year	Number	Percent of live births
1990	35,474	5.8 %
1991	35,359	5.8 %

Low birth weight is a major cause of infant mortality. Birth weight is also an important element in childhood development. There are many factors that lead to low birth weights, such as smoking tobacco during pregnancy, using alcohol or other nonprescribed substances, poor nutrition, inadequate prenatal care, and premature birth.

Low birth weight babies are at a higher risk to be born with underdeveloped organs. This can lead to lung problems, such as respiratory distress syndrome, bleeding of the brain, vision loss, and/or serious intestinal problems. Low birth weight babies are more than twenty times more likely to die in their first year of life than babies born at a normal weight.

El Dorado County

The total number of low birth weight babies was 120 in El Dorado County in 2008, which was 6.6 percent of the total number of births in the same year. This percentage has decreased from 7 percent in 2002 and 2003, and is 0.2 percent less than the rate of low birth weight babies across California.

8.6 Teenage Pregnancy

Overview

Teen births are reported by the California Department of Health Services as births to mothers under the age of twenty. It is a subset of the birth data published by the California Department of Public Health.

Teen pregnancy is a major national and state concern because teen mothers and their babies face increased risks to their health and economic status. According to the National Center for Health Statistics, teen mothers are more likely than mothers over age twenty to give birth prematurely (before thirty-seven completed weeks of pregnancy). Many factors contribute to the increased risk of health problems of babies born to teenage mothers. Teens often have poor eating habits and neglect taking vitamins. Many teens smoke, drink alcohol, or even take drugs.

Teenage mothers are more likely to drop out of high school than those who wait until later years to have their own children. Usually lacking necessary education skills, teenage mothers potentially have a harder time finding and keeping well-paying jobs.

El Dorado County

Births to teenage mothers in El Dorado County represented 10 percent of all live births in 1995, but have since been decreasing even though the population has grown. Also, teen pregnancy rates in El Dorado County have always been lower than the overall incidence throughout California. Only 6.2 percent of all births in the county were from teen mothers in 2008, lower than the California average of 9.4 percent.

8.7 Late Prenatal Care

Overview

Late prenatal care is a count of births where the mother first saw a physician about her pregnancy after her third trimester began. Data is collected by county health departments from surveys of every birth and reported to the California Department of Public Health. The survey includes a question about when the mother first sought medical care during her pregnancy.

Late prenatal care is one of the more prominent risk factors for many medical complications later in pregnancy, during childbirth, or among the children themselves. Early medical care can help expectant mothers with lifestyle and medication changes that might otherwise affect their child.

El Dorado County

In 2008 the percent of live births with late prenatal care in the county was 2.9 percent compared to 3.2 percent in the state. However, county rates have been similar to state rates since 1996.

8.8 Medical Service Providers

Overview

The Medical Board of California is the state's licensing agency for practicing physicians. The table in this section presents the number of licenses where the primary address of the practice is in El Dorado County. This may not entirely represent health care availability in the area if there are a significant number of physicians practicing part-time in El Dorado County with a primary address in neighboring places.

The number of practitioners providing services within an area can indicate the available health care resources in a community. Access to health care and preventative services, such as immunizations and health screenings, are important to an individual's health. Those lacking preventative services are at a higher risk for some diseases, especially those that are preventable by vaccine.

El Dorado County

As of 2008, there were 302 physicians actively practicing in El Dorado County, a decrease of one physician from the previous year, although there is a general upward trend over the last decade. As the number of physicians in California and El Dorado County continue to rise, community health and preventative care services will continue to improve. Also, an influx of physicians in a particular area raises that area's economic and educational status.

Number of Physicians

Fiscal Year	Number of physicians	Total physicians in California
1999	242	82,872
2000	251	84,675

9. Welfare

The amount of assistance utilized by families and individuals in need is an indication of how well the community is meeting the basic needs of the less fortunate in our society. Also, by assessing the available services and the amount of existing need, it becomes apparent what additional services and/or assistance might improve the quality of life in a specific area. Welfare indicators are also a good indication of the county's socio-economic make-up.

In this section:

9.1 TANF/CalWORKs Caseload

Overview

The table shows the annual average number of California Work Opportunity and Responsibility to Kids (CalWORKs) recipients (persons) and cases (families or households). CalWORKs is California's implementation of the federal Temporary Aid to Needy Families (TANF) program. Under the welfare reform legislation of 1996, TANF replaced the old welfare programs known as Aid to Families with Dependent Children (AFDC), the Job Opportunities and Basic Skills Training (JOBS) program, and the Emergency Assistance (EA) program.

CalWORKs is a welfare program that gives cash aid and services to eligible needy California families. The program serves all fifty-eight counties in the state and is locally operated by county welfare departments. If a family has little or no cash and needs housing, food, utilities, clothing, or medical care, they may be eligible to receive immediate short-term help. Families eligible for cash aid are those with needy children who are deprived because of a disability, absence or death of a parent, or unemployment of the principal earner. The assistance is intended to encourage work, enable families to become self-sufficient, and provide financial support for children who lack the proper support and care.

Information about these programs is useful in determining which areas need the most assistance and which areas have the greatest number of people utilizing assistance programs. Higher incidence of CalWORKs enrollment may indicate a lack of job opportunities for lesser skilled workers, or additional health or social issues that keep people from holding on to adequate employment.

El Dorado County

Between 2008 and 2009, the number of TANF/CalWORKs cases in the county increased 11 percent, compared to an 8 percent increase in California. In the same year, the number of recipients in the county increased 16 percent, compared to a 9 percent increase in California.

TANF/CalWORKs Caseload

Year	Average number of cases	Average number of recipients

9.2 Food Stamps Caseload & Expenditures

Overview

The food stamp program is a federally funded program aimed at ending hunger and improving nutrition and health. The program is available to people whose income falls below a certain level, but who are actively seeking employment or are currently employed.

The food stamp program is administered through the U.S. Department of Agriculture (USDA). The department pays all of the costs of the food stamps issued and half of the administrative costs of the program. The state and county share the other half of the administrative costs. Through this system a county can provide for the basic nutrition needs of its population without suffering a major drain on its economy. Food stamps cannot be used to buy items such as pet food, soap, paper products, household supplies, alcoholic beverages, vitamins, or any food prepared in the store or ready-to-eat.

As with CalWORKs, food stamp caseloads and expenditures may be an indication that issues exist in the county affecting the ability of people to work, either due to lack of jobs or lack of ability to do paid work. Since those working may also be eligible for food stamp assistance, a high food stamp caseload may also indicate that a large percentage of households are supported by employment paying relatively low wages.

El Dorado County

Between 2008 and 2009, the number of households receiving food stamps increased 9 percent, while the number of persons increased 8 percent. In comparison, the average number of households receiving food stamps in California increased 9 percent, and the average number of persons receiving food stamps increased 7 percent in the same year.

Total expenditures in the county rose to its highest point ever in 2009, increasing by 14 percent , compared to a 15 percent increase in California.

Food Stamps, Recipients, and Expenditures

Year	Average number of households	Average number of persons	Total expenditures
2000	1,513	3,478	$ 3,051,748
2001	1,453	3,285	$ 2,984,037

9.3 Medi-Cal Caseload & Expenditures

Overview

Medi-Cal is California's program that replaces the federal Medicaid program in the state. It was created before Medicaid and, therefore, California legislators successfully requested that the federal government exclude this state from their program. It covers people who are disadvantaged physically or financially. Some examples of Medi-Cal eligibles are people aged 65 or older, those who are blind or disabled, those who receive a check through the Supplemental Security Income/State Supplemental Payments program, children and parents who receive financial assistance through the CalWORKs program, and women who are pregnant or diagnosed with cervical or breast cancer.

Many Medi-Cal recipients are also either CalWORKs or food stamp recipients, creating an overlap in program enrollment.

Information on Medi-Cal programs is helpful in determining the need for public medical assistance in a particular community. As with CalWORKs and food stamps, the relative need for assistance is also an indicator of the social and/or economic status of area residents.

El Dorado County

In 2009, approximately 10 percent of the population in El Dorado County was eligible for Medi-Cal programs (17,192 people). In comparison, 18 percent of the population throughout California was eligible. The number of eligibles in the county has been increasing since 2003.

Medi-Cal Users

Year	Beneficiaries	Percentage of County Population	California Beneficiaries	Percentage of California Population
2003	13,621	8.1 %	6,478,049	18.0 %
2004	14,004	8.2 %	6,489,774	17.8 %

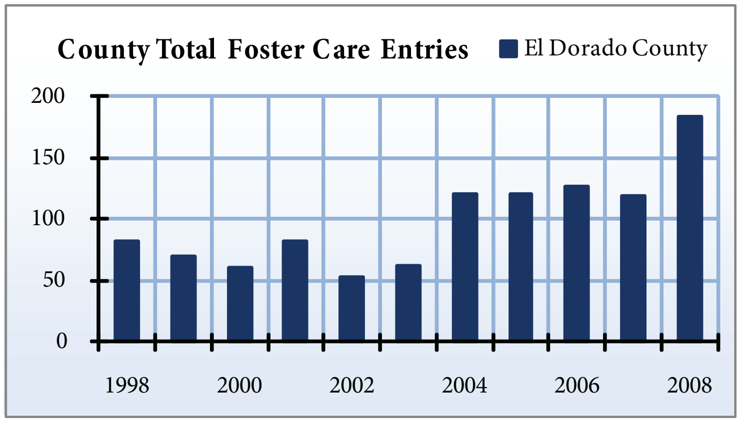
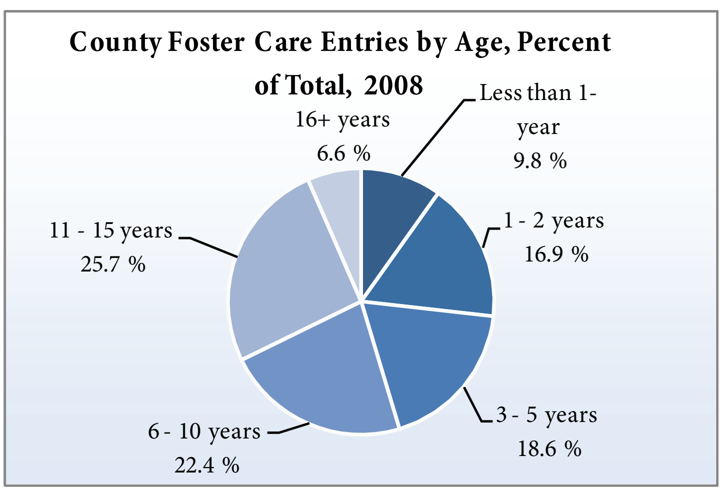
9.4 Foster Care Entries



Overview

Foster care is an out-of-home care system designed to protect children who cannot safely remain in the care of their families. Child abuse and/or neglect are the main causes of child removal from the home, making the child a dependent of the court. The foster care program is aimed at placing these children (who have been removed from their families) in an environment where they will receive proper care and attention. Foster care entries can be of many different types, including kinship, foster, foster family agencies, group homes, shelters, and guardian care.

It is common for children placed in foster care to remain in the system, with multiple placements, until age eighteen. Depending on the success of the initial placements, the time spent in the welfare foster system can have lasting effects on the child's adult life following emancipation. For example, statistics show that children with over five placements suffer more hardships than a child who had fewer than five placements. A small but disturbing number of males enter the state prison system after they leave the child welfare system, while those women who become mothers while in foster care are four times as likely to receive welfare or state aid compared to other young females in their age group. It has been determined by the California Youth Connection that many emancipating foster youth are not made aware of their eligibility for benefits that could support their housing, child care, and employment needs. Roughly two-thirds of foster youth have college ambitions, but many emancipating youths do not attend because information on higher education and financial aid opportunities is not consistently provided in a timely manner.



El Dorado County

A total of 183 children entered foster care in El Dorado County in 2008, an increase of 54 percent from the previous year. The age of these children varied greatly, ranging from less than one year old to over 16 years of age. Of the 183 children who entered foster care in 2008, eighteen were less than one year old.

County Foster Care Entries by Age

Year	Less than 1-year	1 - 2 years	3 - 5 years	6 - 10 years	11 - 15 years	16+ years	Total	Annual percent change

9.5 School Free and Reduced Meals

Overview

This indicator is the count of K-12 students enrolled in the free or reduced-priced meal program. The program provides meals to students from income-qualifying families. Families only have to claim a certain income level to enroll their children in the program, and no evidence or auditing is required. Periodically, schools will actively promote the program, which can temporarily boost enrollment.

NOTE: Total enrollment numbers differ between this indicator and section 10.1 because total enrollment for the free and reduced meal is calculated for total enrollment in October of a given year, students between ages 5 and 17.

El Dorado County

The percent of students enrolled in the free and reduced price meal program has increased significantly since 2000, from 21 percent to 31 percent in 2009. Program enrollment went from a low of 5,925 in 2000 to a high of 8,980 in 2009.

School Free and Reduced Meals

Year	Total Free and Reduced Meals	Total Enrollment	Percent of Students
1999	6,334	27,844	22.7 %
2000	5,925	28,096	21.1 %
2001	5,965	28,690	20.8 %
2002	5,948	28,874	20.6 %
2003	6,105	29,072	21.0 %
2004	6,242	29,396	21.2 %
2005	6,449	29,183	22.1 %
2006	6,561	29,138	22.5 %
2007	6,826	28,950	23.6 %
2008	7,392	28,686	25.8 %
2009	8,980	29,021	30.9 %

10. Education

The quality of an area's educational institutions can be a critical factor in a person's decision on where to live, raise a family, and locate his or her business. Education is considered one of the most fundamental socio-economic indicators of a successful life, and a county with substantial, respectable schools is very attractive to parents.

The indicators in this section cover enrollment volume and student performance, each indicating different aspects of the local community. Enrollment data can be used to refine the estimate of population by age (section one) and school performance can influence employment and income potential. Good performance in schools can help residents avoid the need for public assistance health and welfare programs in the future. Often, the amount of education a person achieves has a strong influence on occupations, earnings, poverty, and health care.

In this section:

10.1 School Enrollment

Overview

Total enrollment as reported by the California Department of Education is shown for the 2001-2002 school year through the 2008-2009 school year. The data was compiled from the California Basic Education Data System (CBEDS). On October 4th of each year, the number of students enrolled in public schools that day is reported to CBEDS. California Youth Authority schools (CYA) are also included in enrollment figures. CYA schools provide institutional training and parole supervision for juvenile and young adult offenders.

School enrollment is the most useful indicator of change in the child population after the 2000 Census. As discussed in the age distribution indicator in section one, the decennial census is the only time when population by age is counted, and any data for later years is typically a projection of 2000 Census data. The child population is the most difficult to project because of changing family migration and fertility patterns. School enrollment provides the best data with which to estimate the population of children in the community.

Enrollment trends provide insight into a school's financial stability. Funding is based primarily on enrollment and average daily attendance. Since school districts often face funding challenges, understanding trends in enrollment will help them produce more accurate financial plans.

El Dorado County

In the 2008-2009 school year, 29,336 students were enrolled in El Dorado County schools. This number represents a 1 percent decrease from the 2007-2008 year. Total enrollment has increased by 232 students since the 2001-2002 school year.

Total School Enrollment

School Year	Total Enrollment	Annual Percent Change
2001-2002	29,104	n/a
2002-2003	29,147	0.1 %

10.2 High School Dropout Rate

Overview

High school dropout rates measure how many students fail to complete state-mandated curriculum requirements. In order for a student to be officially designated as a dropout, he or she must have been previously enrolled in any grade level, 9-12, and left school without re-enrolling in another public or private educational institution or school program for forty-five consecutive days. The one-year dropout rate is the number of dropouts in grades 9-12 divided by the total enrollment in those grades.

The completion of high school is a requirement for most jobs. Even many lower skilled jobs require a high school diploma. According to the U.S. Census Bureau, people with a high school diploma who did not attend college earn 23 percent more per year on average than those without a diploma. The employment rate for high school dropouts is 11 percent less than rate for high school graduates.

High dropout rates may indicate social issues with families in the community. It may also indicate a workforce that is not skilled enough to attract higher wage jobs to the area, which is important for economic development.

NOTE: Due to Department of Education data discrepencies 2006 - 2008 drop out numbers are not historically comparable.

El Dorado County

There were 373 students designated as high school dropouts in El Dorado County in 2007, or a 3.7 dropout rate. This number is lower than the 4.9 one-year drop-out rate in California.

High School Dropouts, County (Percent of Total Enrollment)

Year	Number of dropouts	1-year dropout rate	CA 1-year dropout rate

10.3 Graduates Eligible for UC or CSU System

Overview

This indicator is the count of high school graduates who have completed coursework required by either the California State University or University of California postsecondary education systems. The data is reported by schools to the California Department of Education in their annual California Basic Educational Data System (CBEDS) reports. Further eligibility based on SAT or other college entrance exams are not included here.

A college education is critical for most students looking for higher-wage employment. Also, this is an indicator of the support provided to K-12 students from a combination of the local school system, parents, and the community.

El Dorado County

Between 2000 and 2007, the county has had a similar percentage of its graduates complete coursework to be CSU/UC eligibile to that of California. However, that percentage decreased significantly in 2007-08. This decrease may be temporary or due to incomplete reporting, which can happen – forthcoming data for 2008-09 will help clarify the picture.

With the exception of the 2007-2008 school year the percent of El Dorado County graduates eligible for the UC or CSU system has been very comprable to the state average.

Graduates Eligible for UC or CSU System

Year	County Graduates eligible for UC or CSU System	County Percent of Graduates eligible for UC or CSU System	CA Percent of Graduates eligible for UC or CSU System
2000-01	560	31.5 %	35.6 %

10.4 English Learners Enrollment

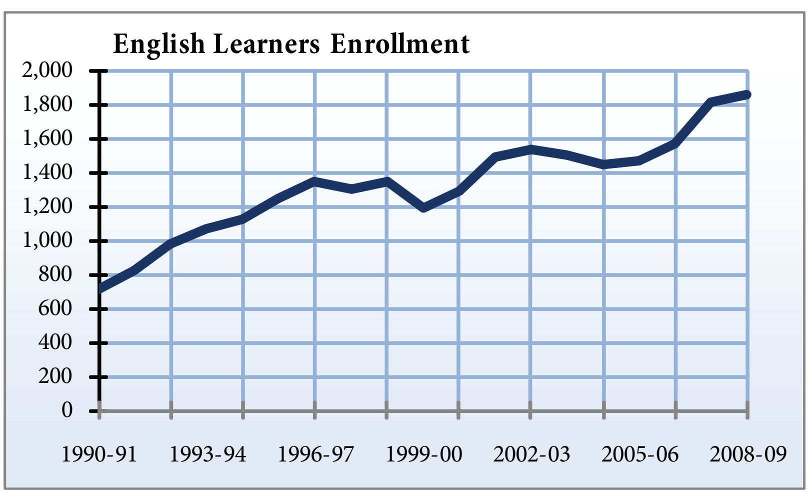
Overview

This is the count of K-12 students enrolled in English language learning (ELL) programs. These programs were once referred to as "English as a second language" (ESL).

ELL programs require additional school resources per student, although enrollment in the program does not increase school funding, so this can be a measure of hardship for local school districts. It is also a measure of community culture – children and families who continue to primarily use a non-English language can indicate adherence to native culture and may have less access to high paying employment opportunities.

El Dorado County

The total English learner enrollment has increased steadily over the past two decades. From 1990 to 2009 the total increase in English learners was 161 percent compared to a 53 percent increase in California. The sharp increase seems to have flattened out somewhat as there was a 2.2 percent increase from the 2007-2008 scchool year to the 2008-2009 school year.



English Learners Enrollment

Year	Enrollment
1990-1991	711
1991-1992	825
1992-1993	977
1993-1994	1,064

10.5 Average SAT Scores

Overview

The SAT is designed to measure verbal and mathematical reasoning abilities that are related to successful performance in college, according to the California Department of Education. Academic, demographic, and socioeconomic factors can affect the results of the test scores. The largest factor affecting average SAT scores is the number of students taking the test; as the number of test takers increases, scores tend to fall.

Students are required to take the test only if they plan on attending a college that requires it for admission. This is the primary reason the SAT is not an accurate measure of the effectiveness of school curriculum or teaching. If a small percentage of students from a school take the test, then the average score could reflect selective testing; a school may encourage only those students who are identified as high achievers to participate. For this reason, the percentage of students who took the exam is provided. The highest possible score a student can receive is 2400.

NOTE: Average SAT scores are only reported for graduating seniors. The scores from students who take the SAT as juniors are included with their graduating class.

El Dorado County

Average SAT scores in the county are significantly higher than those in California. During the 2008-2009 school year, the average score was 1594 compared to 1492 in the state as a whole.

Average SAT Scores (out of 2400)

School Year	County % of Students who took SAT	County Average SAT Scores	CA % of Students who took SAT	CA Average SAT Scores
2005-06	34.4%	1613	36.7%	1498
2006-07	34.7%	1583	36.9%	1489
2007-08	35.4%	1580	35.9%	1493
2008-09	37.2%	1594	34.7%	1492

10.6 Academic Performance Index (API)

Overview

The purpose of the Academic Performance Index is to measure the academic performance and progress of schools. It is a reliable measure of academic performance and progress because it uses a test that every student is required to take yearly beginning in second grade and continuing through eleventh grade. The base year for a school's API result is 2006. These results will be used to monitor academic growth.

The 2006 base API incorporates the results of school performance in California's Standardized Testing and Reporting (STAR) program, the California High School Exit Examination (CAHSEE), and the California Alternate Performance Assessment (CAPA). The API is calculated on a scale from 200-1000, using individual student performance on four different tests.

The State Board of Education adopted a performance target of 800 for the 1999 API. This target will serve as an interim statewide target until state performance standards are adopted. The annual growth rate target for schools is equal to 5 percent of the distance between a school's API and the interim state performance target of 800. Schools that receive an API less than 800 have a minimum target of a one-point increase. Schools that meet or exceed the interim target must maintain an API of 800.

The California Department of Education did not calculate API scores for schools with less than 100 students with valid Stanford 9 test scores, or county administered, alternative, continuation, independent, or community day schools.

Combined with SAT scores, API scores can indicate either the learning ability of children in the community, or measure the effect of broader social or economic maladies in the community on children.

It is also important to keep track of a school's API scores because federal No Child Left Behind includes provisions allowing the state to assume more financial and administrative control over local schools that do not make the required improvements in test scores toward a national benchmark.

El Dorado County

El Dorado County's average API has been steadily increasing since 2000. As stated, the goal for county schools is to make an annual minimum increase that is equal to 5 percent of the differance between the school or county's API and 800. El Dorado County has reached the State Board of Educations's performance target each year since 2006.

Average County API

Year	Average API	1 Year Change

11. Crime

Crime rate statistics include information on crimes reported, staffing of the criminal justice system, and the probation caseload. Interpretation of crime statistics is difficult because they may be indicative of any number of local conditions and attitudes, both negative and positive. An above average rate of reported crime in an area can be a direct reflection of social problems in a community. It can also indicate a greater willingness within the community to report crime, perhaps due to a more cooperative relationship between local law enforcement and the citizens. The adequacy of local law enforcement cannot be determined by the information presented in this section.

In this section:

11.1 Reported Crime & Crime Rates

Overview

Crime counts are a summation of crimes reported to local law enforcement agencies. They include misdemeanor and felony reports, but not infractions such as traffic violations. Reported crimes are counted whether or not the criminal is apprehended.

The crime rate is the number of crimes committed per 100,000 people, and includes both violent and property crimes.

Crime rate data can be used to determine whether the amount of crime in a given area is increasing or decreasing, and also to show how crime rates from various areas compare to each other. Crime is an important factor in terms of an area's quality of life. An area with a high crime rate is usually a much less attractive place to live than one with a low crime rate. While it is impossible to predict when or where a crime will occur, individuals and communities can help with prevention by taking note of patterns and trends collected by legitimate agencies.

Crime rates can rise and fall with increasing or decreasing incidence of crime, but rates could also change if more or fewer crimes are reported to local law enforcement agencies. Therefore, careful analysis is needed when evaluating change in crime rates.

El Dorado County

There were 2,027 property crimes and 451 violent crimes in El Dorado County in 2008. The crime rate in the county in 2008 was 14 crimes per 1,000 people, which reflects no significant change in the number of crimes per 1,000 from the preceding year.

County and California Crime Rate per 1,000 Population

11.2 Criminal Justice Personnel

Overview

Criminal justice personnel includes the law enforcement employees working in the different agencies as reported by the California Department of Justice. NOTE: The California Department of Justice relies on local agencies to report the number of criminal justice personnel in their area every year.

Criminal justice personnel information helps identify the types of criminal justice employment within a county. Counties with higher incidence of crime need greater numbers of criminal justice personnel to handle the caseload. If crime is rising and the number of criminal justice personnel is not keeping pace, then local personnel are likely handling greater workloads.

The following types of criminal justice personnel are shown:

Law enforcement or sworn officers and civilian employees in local law enforcement agencies, including city police and county sheriff's departments

Prosecution or personnel involved in the prosecution of the accused

Public defense or personnel primarily responsible for representing those unable to hire a private lawyer

Trial courts or primary and auxiliary judges employed during trials

El Dorado County

The total number of criminal justice personnel in El Dorado County increased slightly between 2007 and 2008. There was an increase of 34 sheriff's department personnel in the same year. In the state of California, the total number of law enforcement personnel increased from 210,797 in 2007 to 227,958 in 2008, according to the California Department of Justice.

11.3 Crime Expenditures

Overview

Expenditures for criminal justice programs in a county measure the amount of money allocated to local law enforcement each year. Criminal justice expenditures include the amount of money spent by a county in a fiscal year, according to the California Department of Justice. These expenses include employee salaries and benefits, as well as services and supplies. Capital expenditures (expenditures made to acquire, add to, or improve property, plant, and equipment) and construction and maintenance of structures are not included in the data.

NOTE: The California Department of Justice relies on local agencies to report criminal justice expenditures in their area. Local government expenditure reports may show different spending patterns on criminal justice line-items, which usually include capital expenditures. The data reported to the department should include some expenditures entered in administrative line items, as well.

The criminal justice expenditures statistic is somewhat ambiguous because higher expenditures may imply a local problem with crime or a budgetary priority for prevention or prosecution of crimes. Evaluation must be included with trends in crimes and personnel.

NOTE: Criminal Justice Expenditures are not inflation adjusted.

El Dorado County

In FY06, approximately $52.5 million was spent on criminal justice expenditures in El Dorado County. Those expenditures have increased $15.7 million since FY98. Between FY98 and FY07, public defense expenditures increased the most, with a 126 percent increase. This increase in expenditures was followed by law enforcement expenditures (64 percent). Judicial expenditures (-4.4 percent) and prosecution expenditures (-0.3 percent) experienced a decrease over the same time period.

Criminal Justice Expenditures (Thousands)

Year	Law enforcement	Judicial	Prosecution	Public defense	Total

11.4 Probation Caseload

Overview

Probation allows people who have been convicted of a minor crime to serve time outside criminal justice facilities, performing various duties such as trash collection, park cleanup, and landscape maintenance of the surrounding community. Data is representative of December 31 of a given year.

Significant probation caseloads in a county can be indicative of minor criminal activity within the community, a criminal justice system that relies on community-based rehabilitation programs, or any number of additional factors.

El Dorado County

There were a total of 1,512 probation cases in El Dorado County in 2008, with 1,211 cases related to felony offenses (a decrease of 95 from the previous year) and 301 related to misdemeanors (an increase of 23 from the previous year).

County Probation Caseload

Year	Felony Offense	Misdemeanor Offense	Total
1999	552	568	1,120

REPORTS

COSUMNES RIVER FLOW AUGMENTATION PROJECT

PROJECT SUMMARY

Introduction

The Cosumnes River Flow Augmentation Project (Project) is being proposed by a Coalition of interests[1] to provide supplemental flows to the Cosumnes River that will provide fish passage improvements for fall-run chinook salmon and for evaluation of groundwater recharge rates from the Cosumnes River channel. This project will be facilitated by releasing supplemental water from the Folsom South Canal into the Cosumnes River to pre-wet the river channel prior to the onset of natural fall flows in the lower reaches of the river. Figure 1 shows the project location and major features. The Project will provide critical information regarding the effectiveness of releasing supplemental water for local groundwater recharge and of supplementing the natural flow regime to restore a historical flow pattern for the improvement of fall-run chinook salmon passage.

The Cosumnes River is a keystone of fishery conservation efforts in the North Delta. The Anadromous Fish Restoration Program (AFRP), The Nature Conservancy (TNC), and the University of California, Davis (UCD), have sponsored numerous research projects on the health of the salmon fishery of the Cosumnes River. AFRP has also identified the Cosumnes as having potential for contributing to the fish doubling goals of the Central Valley Project Improvement Act (CVPIA). The AFRP has also set program objectives specifically directed at the Cosumnes River and the acquisition and restoration of fish habitat, primarily directed at improving passage and spawning habitat for fall-run chinook salmon.

The geologic setting and unregulated nature of the Cosumnes River has also made it a focus of regional water management strategies for Sacramento County, and particularly for the Southeast Sacramento County Agricultural Water Authority (SSCAWA). The SSCAWA, in partnership with the Sacramento County Water Agency (SCWA), the TNC and UCD are sponsoring a number of programs aimed at evaluating and developing a conjunctive use strategy that capitalizes on the natural geology of the region for groundwater recharge and surface water management.

---

[1] The Coalition consists of the Sacramento County Water Agency, The Nature Conservancy, the Southeast Sacramento County Agricultural Water Authority (members include Omochumne-Hartnell Water District, Galt Irrigation District, and Clay Water District), the Fisheries Foundation of California, and the UCD Center for Integrated Watershed Science and Management.

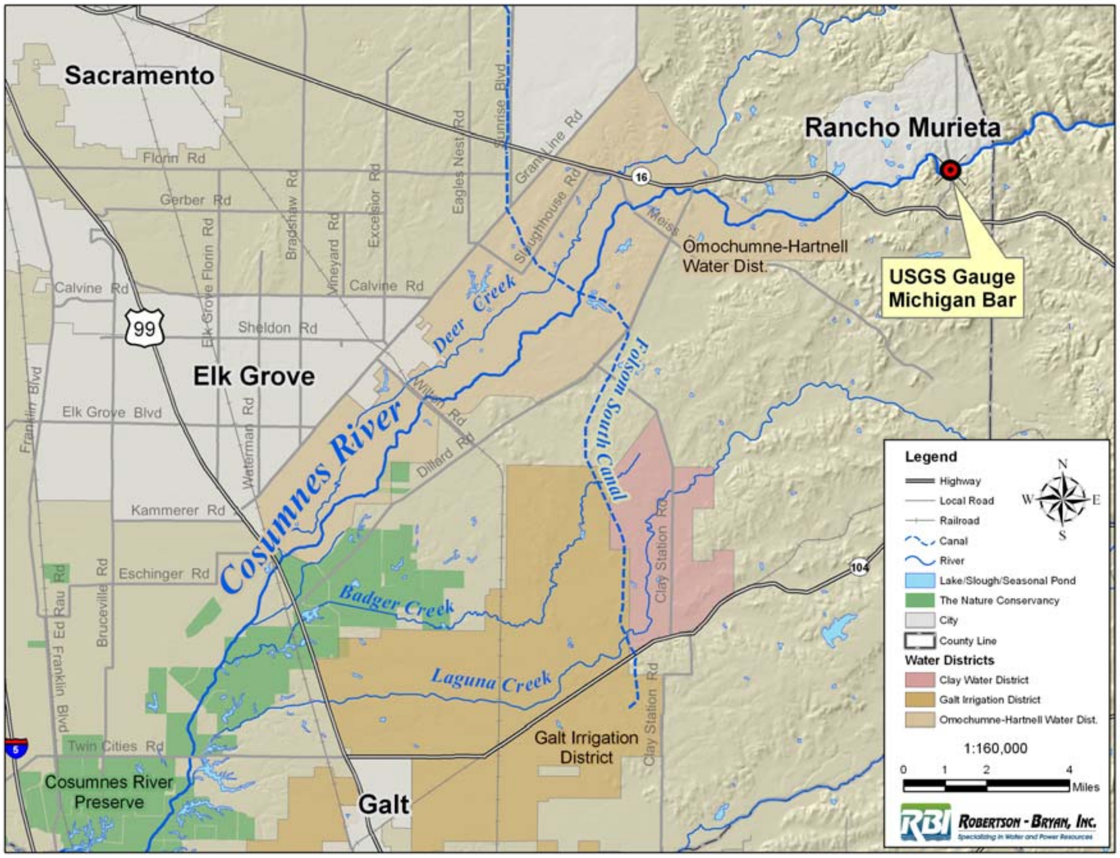

Figure 1. Project Area.

Project Overview

The Project will release up to 5,000 acre-feet (af) of water into the Cosumnes River from an existing turnout of the Folsom South Canal. The objectives are to 1) improve upstream fall migration of salmon, and 2) to evaluate groundwater recharge from the Cosumnes River channel. The first objective will be accomplished by allowing the Cosumnes to connect to tidewater earlier in the fall and sustaining non-barrier flow conditions after initial connection. The second objective will be accomplished by making controlled releases into the river channel and monitoring the surface water–groundwater exchange processes along the length of the channel.

Project Water Supply

The long-term water supply for the Project will be provided by Sacramento County Water Agency (SCWA) using water developed from the Eastern Sacramento County Replacement Water Supply Project (RWSP). The RWSP is intended to provide for the beneficial use of remediated water generated by groundwater extraction and treatment (GET) facilities of the Aerojet / Boeing groundwater cleanup project mandated by the Regional Water Quality Control Board.

Currently, GET facilities are discharging approximately 11,600 acre-feet annually (afa) to Alder Creek, which discharges to Lake Natoma, and 8,600 afa to Buffalo Creek, which discharges to the American River below Lake Natoma. None of the current discharges are being reclaimed for beneficial uses. At full development the RSWP will provide 30,465 afa of water for potable use and 5,000 afa to the CRFAP. Remediated water from the GET facilities will be discharged to the American River via various creeks and drainages and rediverted from the American and Sacramento River at the following locations:

Discharge Points:	**Diversion Points:**
Alder Creek to Lake Natoma(15,951 afa)	Folsom South Canal to American States Water Company (5,000 afa)
Buffalo Creek (6,693 afa)	Folsom South Canal to Cosumnes River (5,000 afa)
Boyd Station Channel (8,798 afa)	Fairbairn Diversion to City of Sacramento (5,000)
Local storm drain (3,709 afa)	Freeport Diversion to SCWA (20,465 afa)
Cordova Drainage Channel (323 afa)	

Project Operations

The Project is designed to create river conditions similar to what might have been experienced prior to the reduction of groundwater levels underlying the Cosumnes River between Highway 16 and the Cosumnes River Preserve (downstream of Twin Cities Road). The Project is not intended to create a hydraulic connection with the tidewater area of the Cosumnes River and the Delta before it naturally occurs from run-off generated by fall precipitation in the Sierra Nevada foothills.

A preliminary flow-release schedule (Figure 2) has been develop that meets the following criteria: (1) pre-wet the greatest length of channel possible, and (2) maintain sufficient water in reserve for augmenting river flow to sustain the connection with tidewater during the optimal salmon migration period of November 1 to December 31.

Channel pre-wetting flows will begin on October 15 and continue through December 31. By beginning flow releases on October 15, the Cosumnes River channel would receive approximately 2,000 af of water before the river typically connects with tidewater (mid-November).

Water not used for channel pre-wetting will be held in reserve and used to supplement natural flows through December 31 to eliminate stranding conditions during the migration period. Flow augmentation releases will be made when Cosumnes River flows fall below that required to maintain upstream migration conditions, estimated to be 65–70 cubic feet per second (cfs), measured at the U.S. Geological Survey (USGS), Michigan Bar gauging station. Historical flow record for the Cosumnes River, with consideration of today's groundwater conditions, indicates that supplement releases to maintain migration conditions would be needed in about 93% of the years.

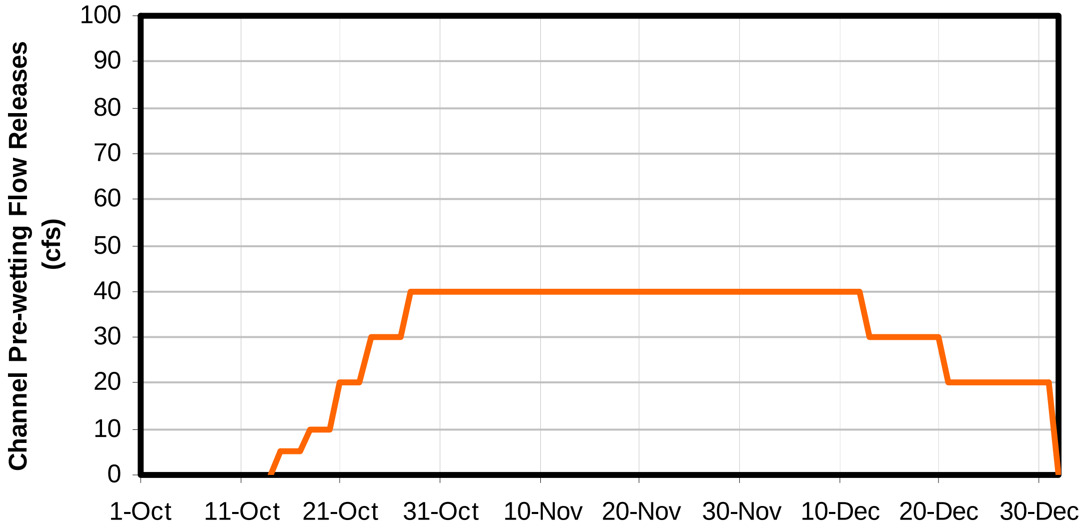

Figure 2. Cosumnes River channel pre-wetting releases from the Folsom South Canal.

Monitoring Program

Escapement and Out-Migration Monitoring

The Fisheries Foundation of California (FFC) will conduct Escapement and Out-Migration Monitoring. The FFC will either be funded through the SSCAWA, if the SSCAWA and Coalition partners develop the funding for this task, or the FFC may fund this task directly.

This task will evaluate the adequacy of flows for salmon passage by life stage. Flow needs will focus on the lower critical passage reach, below Folsom South Canal, to above tidewater (Twin Cities Road crossing) where passage presents the biggest problem. The duration and rate of flow needed to allow the run to proceed upstream and successfully reach spawning grounds will be a focused evaluation building on information gathered in previous years. The duration and rate of flow needed to maintain a successful migration pattern will be determined through adaptive management of flow releases from the Folsom South Canal. The FFC will also conduct out-migration surveys to provide information on the success of fall spawning in the Cosumnes River.

Groundwater-Surface Water Interaction Monitoring

Professor Graham Fogg, Ph.D., of the Land, Air, and Water Resources and Geology Department at UCD, will lead the Groundwater–Surface Water Interaction Monitoring

Task. UCD will either be funded through the SSCAWA, if the SSCAWA and Coalition partners develop the funding for this task, or UCD may fund this task directly.

Ongoing work on hydrogeology of the Cosumnes River aquifer system has shown that the river is the major source of recharge to the local groundwater system and that most of this recharge probably occurs over a small percentage of the channel between Michigan Bar and Twin Cities Road. Successful management of river flows to sustain salmon migration in the fall requires more detailed information on river–aquifer water exchange along this entire reach. This more detailed information can be obtained through careful hydrologic monitoring before and after a controlled flow release experiment, wherein a known amount of water is diverted into the channel near Folsom South Canal. Instrumentation deployed for such an experiment will also be useful for studying interaction between groundwater and surface water in the system on a continuous basis.

COSUMNES RIVER FLOW AUGMENTATION PROJECT
2005 PILOT PROJECT OPERATION PLAN

Introduction

The Cosumnes River Flow Augmentation Project (Project) is being proposed by a coalition of interests[1] to provide supplemental flows to the Cosumnes River that will provide fish passage improvements for fall-run chinook salmon and for evaluation of groundwater recharge rates from the Cosumnes River channel. This project will be facilitated by releasing supplemental water from the Folsom South Canal into the Cosumnes River to pre-wet the river channel prior to the onset of natural fall flows in the lower reaches of the river. Figure 1 shows the project location and major features.

The pilot project phase of the Project is aimed at implementing the releases to the Cosumnes River in the fall of 2005, to evaluate the effectiveness and adequacy of project operations. Information gained in during the pilot project phase will be used to refine long-term project operations planning. The pilot project will have a duration of only one season (October 2005 through January 2006) for which a temporary non-permanent water supply is being requested from the U.S. Bureau of Reclamation (Reclamation).

Project Objectives

The pilot project phase of this Project proposed to release up to 5,000 acre-feet (af) of water into the Cosumnes River from an existing turnout of the Folsom South Canal. The objectives are to: 1) improve upstream fall migration of salmon, and 2) evaluate groundwater recharge from the Cosumnes River channel. The first objective will be accomplished by allowing the nature flows of the Cosumnes River to connect to tidewater earlier in the fall, and sustaining non-barrier flow conditions after initial connection. The second objective will be accomplished by making controlled releases into the river channel and monitoring the surface water–groundwater exchange processes along the length of the channel.

The Cosumnes River is a keystone of fishery conservation efforts in the North Delta. The Anadromous Fish Restoration Program (AFRP), The Nature Conservancy (TNC), and the University of California, Davis (UCD), have sponsored numerous research projects on the health of the salmon fishery of the Cosumnes River. AFRP has also identified the

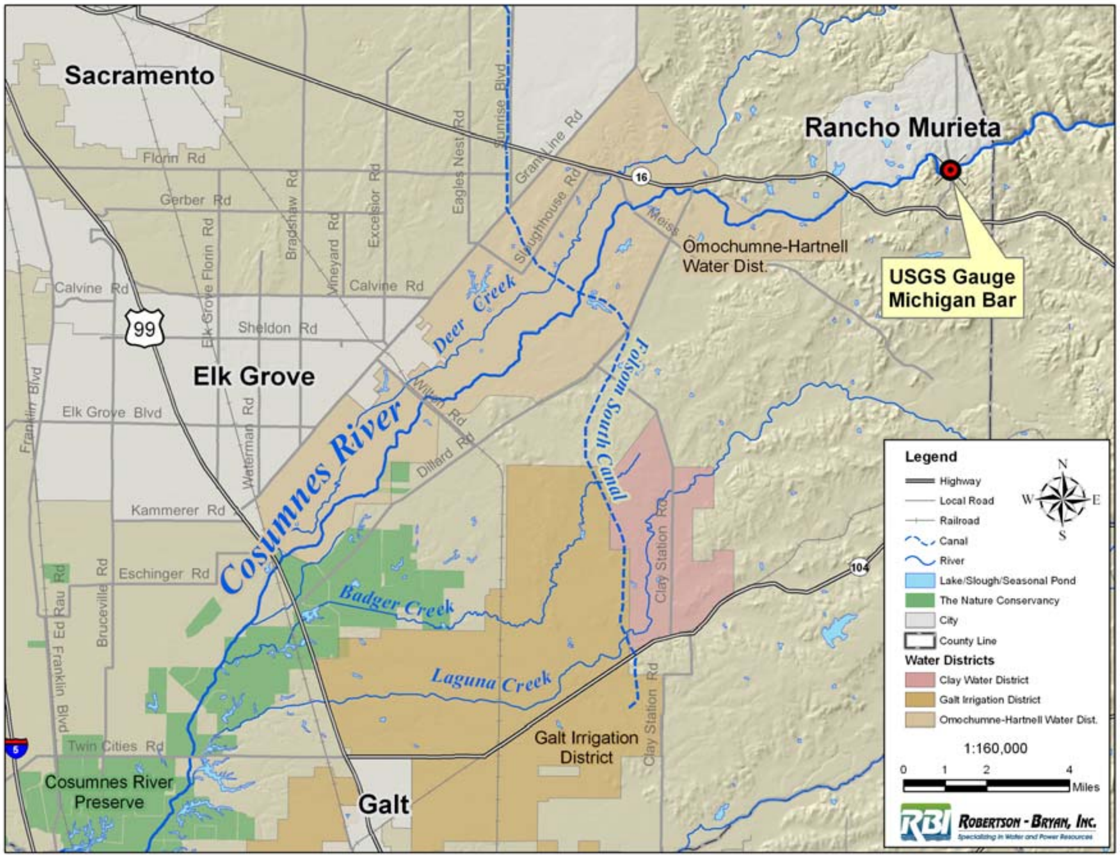

Figure 1. Project Area.

Cosumnes as having potential for contributing to the fish doubling goals of the Central Valley Project Improvement Act (CVPIA). The AFRP has also set program objectives specifically directed at the Cosumnes River and the acquisition and restoration of fish habitat, primarily directed at improving passage and spawning habitat for fall-run chinook salmon.

The geologic setting and unregulated nature of the Cosumnes River has also made it a focus of regional water management strategies for Sacramento County, and particularly for the Southeast Sacramento County Agricultural Water Authority (SSCAWA). The SSCAWA, in partnership with the Sacramento County Water Agency (SCWA), the TNC and UCD are sponsoring a number of programs aimed at evaluating and developing a conjunctive use strategy that capitalizes on the natural geology of the region for groundwater recharge and surface water management.

Pilot Project Water Supply

The Project proponents are requesting the assistance of the Reclamation in identifying a source of surplus or environmental water for implementation of this pilot project. The Project proponents make this request in light of the surplus water conditions that exist within the State this year. This request is aimed at acquiring a one-time commitment of 5,000 ac-ft in the fall of 2005, as described in the following sections. The Project proponents also understand that should Reclamation identify and provide water for this pilot project that this supply will be for one year only. The intent of the pilot project is to allow the Project proponents and Reclamation to identify and address issue that will be faced under long-term implementation of the Project. The Project proponents are committed to addressing the concerns raised by Reclamation regarding the source of water identified for the long-term implementation of the Project.

Pilot Project Operations

The Project is designed to create river conditions similar to what might have been experienced prior to the reduction of groundwater levels underlying the Cosumnes River between Highway 16 and the Cosumnes River Preserve (downstream of Twin Cities Road). The Project is not intended to create a hydraulic connection with the tidewater area of the Cosumnes River and the Delta before it naturally occurs from run-off generated by fall precipitation in the Sierra Nevada foothills.

A preliminary flow-release schedule (Figure 2) has been developed that meets the following criteria: (1) pre-wet the greatest length of channel possible, and (2) maintain sufficient water in reserve for augmenting river flow to sustain the connection with tidewater during the optimal salmon migration period of November 1 to December 31.

Channel pre-wetting flows will begin on October 15 and continue through December 31. By beginning flow releases on October 15, the Cosumnes River channel would receive approximately 2,000 af of water before the river typically connects with tidewater (mid-November).

Water not used for channel pre-wetting will be held in reserve and used to supplement natural flows through December 31 to eliminate stranding conditions during the migration period. Flow augmentation releases will be made when Cosumnes River flows fall below that required to maintain upstream migration conditions, estimated to be 65–70 cubic feet per second (cfs), measured at the U.S. Geological Survey (USGS), Michigan Bar gauging station. Historical flow record for the Cosumnes River, with consideration of today’s groundwater conditions, indicates that supplement releases to maintain migration conditions would be needed in about 93% of the years.

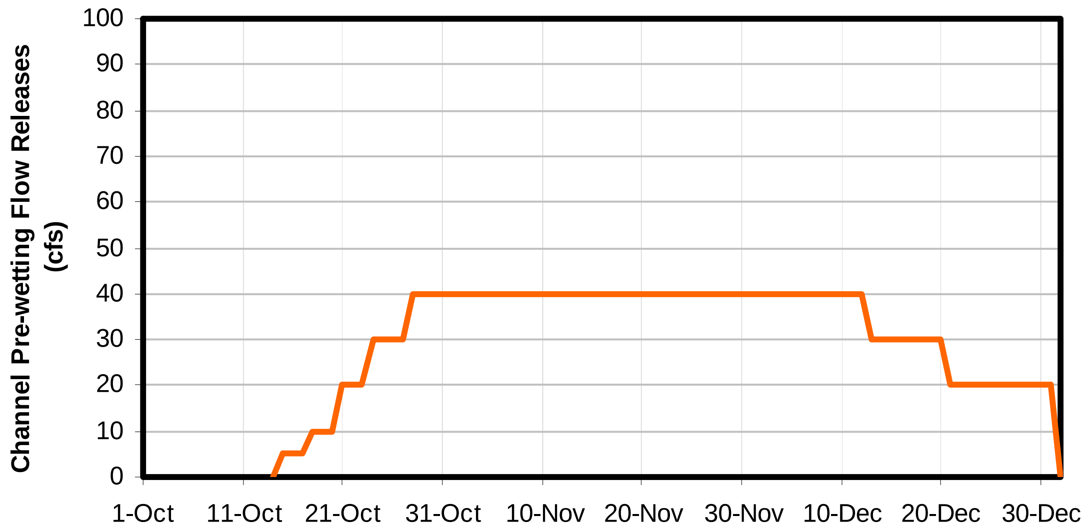

Figure 2. Cosumnes River channel pre-wetting releases from the Folsom South Canal.

Monitoring Program

Escapement and Out-Migration Monitoring

The Fisheries Foundation of California (FFC) will conduct Escapement and Out-Migration Monitoring. The FFC will either be funded through the SSCAWA, if the SSCAWA and Coalition partners develop the funding for this task, or the FFC may fund this task directly.

This task will evaluate the adequacy of flows for salmon passage by life stage. Flow needs will focus on the lower critical passage reach, below Folsom South Canal, to above tidewater (Twin Cities Road crossing) where passage presents the biggest problem. The duration and rate of flow needed to allow the run to proceed upstream and successfully reach spawning grounds will be a focused evaluation building on information gathered in previous years. The duration and rate of flow needed to maintain a successful migration pattern will be determined through adaptive management of flow releases from the Folsom South Canal. The FFC will also conduct out-migration surveys to provide information on the success of fall spawning in the Cosumnes River.

Groundwater-Surface Water Interaction Monitoring

Professor Graham Fogg, Ph.D., of the Land, Air, and Water Resources and Geology Department at UCD, will lead the Groundwater–Surface Water Interaction Monitoring Task. UCD will either be funded through the SSCAWA, if the SSCAWA and Coalition partners develop the funding for this task, or UCD may fund this task directly.

Ongoing work on hydrogeology of the Cosumnes River aquifer system has shown that the river is the major source of recharge to the local groundwater system and that most of this recharge probably occurs over a small percentage of the channel between Michigan Bar and Twin Cities Road. Successful management of river flows to sustain salmon migration in the fall requires more detailed information on river–aquifer water exchange along this entire reach. This more detailed information can be obtained through careful hydrologic monitoring before and after a controlled flow release experiment, wherein a known amount of water is diverted into the channel near Folsom South Canal. Instrumentation deployed for such an experiment will also be useful for studying interaction between groundwater and surface water in the system on a continuous basis.

TABLE OF CONTENTS

List of Figures

1 INTRODUCTION

A coalition of interests[1] supports and developed the Cosumnes River Flow Augmentation Pilot Project (Project) to provide supplemental flows to the Cosumnes River that will improve fish passage for fall-run chinook salmon (*Oncorhynchus tshawytscha*) and provide an opportunity to evaluate the interaction of groundwater and surface water in the Cosumnes River channel. The objectives of the Project are twofold:

- To improve fall-run chinook salmon migration conditions by: (1) allowing the Cosumnes River to connect to tidewater earlier in the fall, and (2) sustaining surface flow continuity within the Cosumnes River after its initial connection.
- To evaluate the rate of groundwater recharge from the river channel between the Folsom South Canal and Twin Cities Road to better guide future groundwater management and environmental restoration efforts along the Cosumnes River corridor.

The Project will release up to 5,000 acre-feet of water into the Cosumnes River from an existing turnout of the Folsom South Canal. The project constitutes the first year of augmenting Cosumnes River flows to meet the above objectives. It is the intent of the coalition of interests that are supporting the Project to continue the Pilot Project through 2010, after which it will become an ongoing annual operation. Hence, this first year effort largely constitutes a demonstration effort to help the Project proponents develop and improve the long-term management of this action. The U.S. Bureau of Reclamation (Reclamation) and the B2 Environmental Water Program will provide the water supply for the Project during its demonstration phase.

This Monitoring Plan identifies the monitoring programs necessary to evaluate the effectiveness of the Project. Monitoring will include:

1) flow-release scheduling performed by Robertson-Bryan, Inc. (RBI), under contract with the Southeast Sacramento County Agricultural Water Authority (SSCAWA);
2) passage of low-flow migration barriers by immigrating adult fall-run salmon and location and timing of spawning by the Fisheries Foundation of California (FFC), under contract with the Anadromous Fish Restoration Program (AFRP); and

[1] The Coalition consists of the Sacramento County Water Agency (SCWA), The Nature Conservancy (TNC), the Southeast Sacramento County Agricultural Water Authority (SSCAWA) (members include Omochumne-Hartnell Water District, Galt Irrigation District, and Clay Water District), the Fisheries Foundation of California (FFC), and the UCD Center for Integrated Watershed Science and Management (UCD).

3) groundwater recharge quantification performed by the Center for Integrated Watershed Science and Management at the University of California, Davis (UCD).

2 PROJECT BACKGROUND

The Cosumnes River corridor provides habitat for a number of special-status plants and animals and is considered an ecological area of statewide importance. The Cosumnes River is the last unregulated major river draining the western slope of the Sierra Nevada having no major dams (Figure 1). Historically, the lower reach of the river supported a matrix of riparian habitats, freshwater marshes, and large tracts of valley oak woodlands.

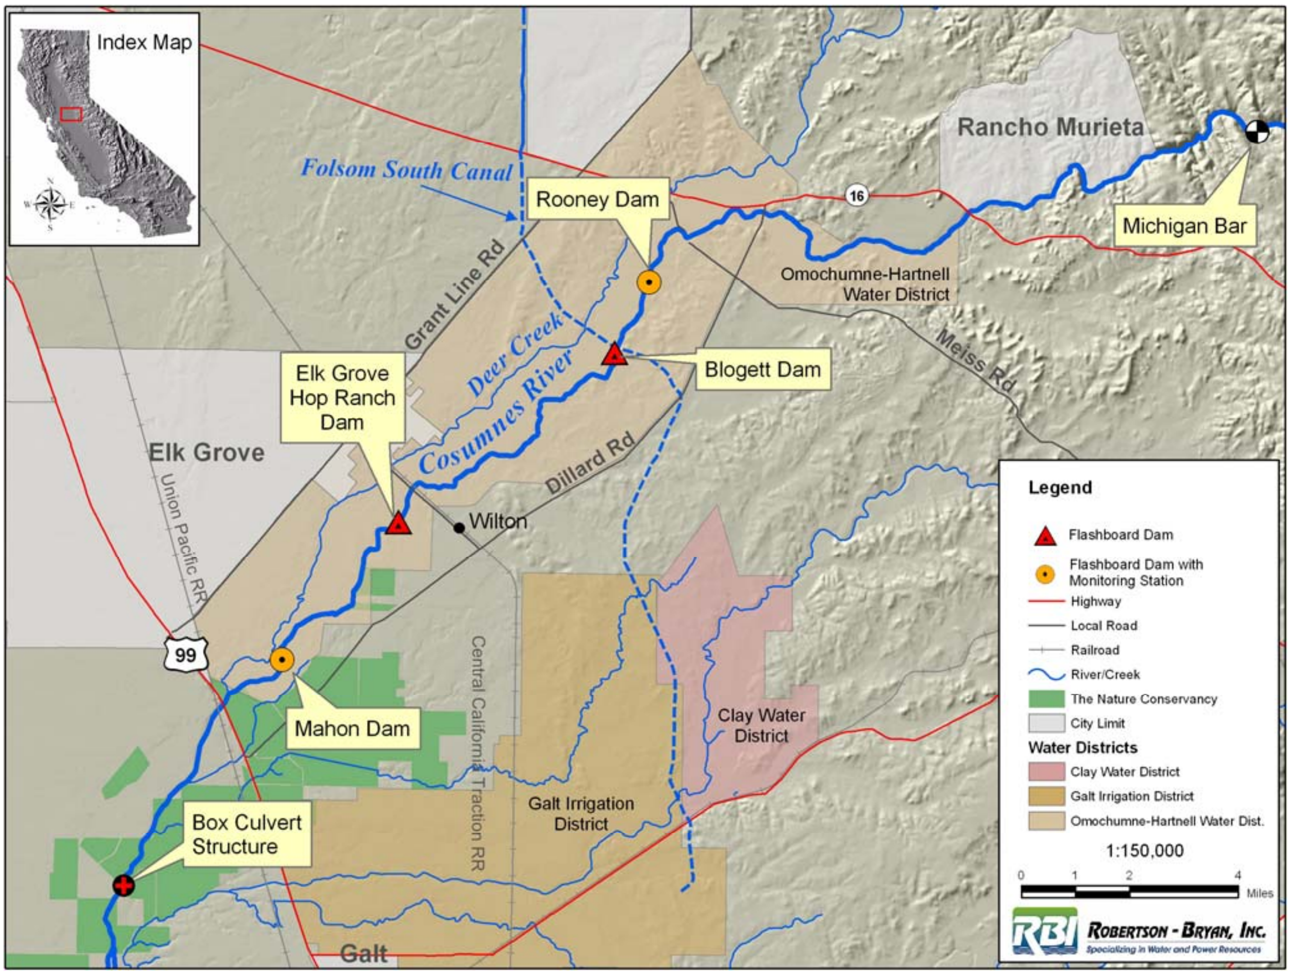

Figure 1. Location map for the Cosumnes River Flow Augmentation Pilot Project.

Recent field and modeling efforts conducted by UCD and others indicate that extensive regional and local groundwater withdrawals over the past 50 years substantially lowered groundwater tables and reduced the base flow of the Cosumnes River and its major tributaries. The Cosumnes River now frequently ceases to flow during summer months, stays dry longer into the fall, and has a dry river bed over an increasingly longer reach compared to historical conditions.

Diminished surface flows have reduced the quality and quantity of aquatic and riparian habitats and the species associated with those habitats.

The Cosumnes River is a cornerstone of fishery conservation efforts in the North Delta. The Anadromous Fish Restoration Program (AFRP) sponsored research on surface flows in the Cosumnes River, the relationship of surface flows to groundwater conditions, and the health of the salmon fishery. The AFRP also identified the Cosumnes as having potential for contributing to the fish doubling goals of the Central Valley Project Improvement Act (CVPIA). The AFRP work plan for Fiscal Year 2004 identifies program objectives specifically directed at the Cosumnes River and the acquisition and restoration of fish habitat, primarily directed at improving passage and spawning habitat for fall-run chinook salmon. In addition, the Nature Conservancy and its partners established the Cosumnes River Preserve on approximately 30,000 acres upstream of the river's confluence with the Mokelumne River. The Preserve provides protection for important biological resources associated with the Cosumnes River through land conservation, habitat restoration, and research.

The size of the Cosumnes River's fall-run chinook salmon population has declined over the past several decades, which has been related to a decline in fall streamflow in the lower Cosumnes River and a shortage of spawning and rearing habitat. Adult fall-run chinook salmon generally migrate up the river with the first fall rains, sometimes becoming stranded by receding flows following the initial storms. Groundwater pumping in the lower basin increased beginning in the 195's, resulting in reduced groundwater levels, such that the river is now disconnected from the regional groundwater table. Summer and fall flow in the lower river below Highway 16 is generally zero, leaving a barren channel of dry substrate. Above Highway 16, in the Sierra foothills, the stream is perennial with some minimal flow even in late summer. Most of the spawning occurs in the upper 10 miles of the reach extending from Latrobe Falls (a natural barrier to upstream passage of anadromous fish) downstream to Meiss Road at Sloughhouse, several miles below the Highway 16 crossing. Some additional spawning occurs below Meiss Road for several miles to the town of Wilton (observations from FFC 2002 survey). The problem for chinook salmon has been lack of fall flows between Highway 16 and tidewater to provide upstream passage to spawning grounds in the perennial flow reach in the foothills. In some years the river remained disconnected with a dry riverbed between tidewater and the spawning grounds (about 20 miles) during the entire fall spawning season.

3 MONITORING PLAN ELEMENTS

Information developed by the monitoring efforts will be used to refine Project operations and to assist in the development of a long-term program for improvement of fall-run chinook salmon migration conditions in the Cosumnes River. The following section describes the approaches that will be used to:

1. monitor and adaptively manage releases from the Folsom South Canal to the Cosumnes River to achieve Project objectives;

2. monitor the abundance, distribution, and lifestage-specific migration timing of fall-run chinook salmon in the Cosumnes River and compare these data to historical data to determine Project effectiveness; and

3. monitor groundwater-surface water interactions to develop a better understanding of the rate and locations of groundwater affected from the river channel.

TASK 1 – FLOW RELEASE SCHEDULING AND MANAGEMENT

The SSCAWA will take the lead in scheduling and managing releases from the Folsom South Canal. On behalf of the SSCAWA, RBI will facilitate the task of flow release scheduling and management. RBI also will coordinate with all members of the Coalition, Reclamation, and permitting and other regulatory authorities regarding the flow releases, as needed. RBI also will also perform field measurements of flows to monitor the effect of releasing channel-wetting flows and regulate flow releases as needed to meet the multiple objectives of the Project.

Flow Schedule

The Project is designed to create river conditions similar to what might have been experienced before the lowering of groundwater levels underlying the Cosumnes River between Highway 16 and the Cosumnes River Preserve (downstream of Twin Cities Road). The Project is not intended to create a hydraulic surface-flow connection with the Mokelumne River and the Delta before it would naturally occur from run-off generated by fall precipitation in the Sierra Nevada foothills (i.e., following the first few substantial storm events).

The flow-release schedule is designed to meet the following operational objectives: (1) to pre-wet the channel (i.e., saturate the channel's underlying substrates), and (2) maintain sufficient water in reserve for purposes of augmenting the Cosumnes River flow in the event additional water is needed to sustain surface water flows to tidewater during the peak salmon migration period during November and December. Figure 2 shows flow-release schedule developed for the demonstration phase of the Project. This schedule provides a framework for managing releases; however, flows may change through adaptive management to maximize the benefits of the available water supply. Channel pre-wetting releases will be made until natural flows sustain a surface-flow connection to tidewater. Studies indicate that in most years, a minimum flow of 75 cfs is required at Michigan Bar to create a connection to tidewater, when the river channel is properly wetted. Therefore, pre-wetting releases from the Folsom South Canal will likely stop once flows measured at Michigan Bar reach 75 cfs.

Once surface flows connect to tidewater as a result of pre-wetting and natural flows, RBI and Fisheries Foundation will monitor river conditions to ensure that upstream passage is maintained free of low-flow barriers. In the event that flows measured at Michigan Bar fall below 75 cfs, augmentation releases will likely begin to prevent stranding of adult salmon in the river reach between the Folsom South Canal and tidewater, with releases to maintain a minimum flow of 75 cfs at Blodgett Dam, immediately downstream of the canal. RBI will evaluate the adequacy of this flow through field measurements and observation of known, low-flow barriers, and make changes to canal releases as appropriate.

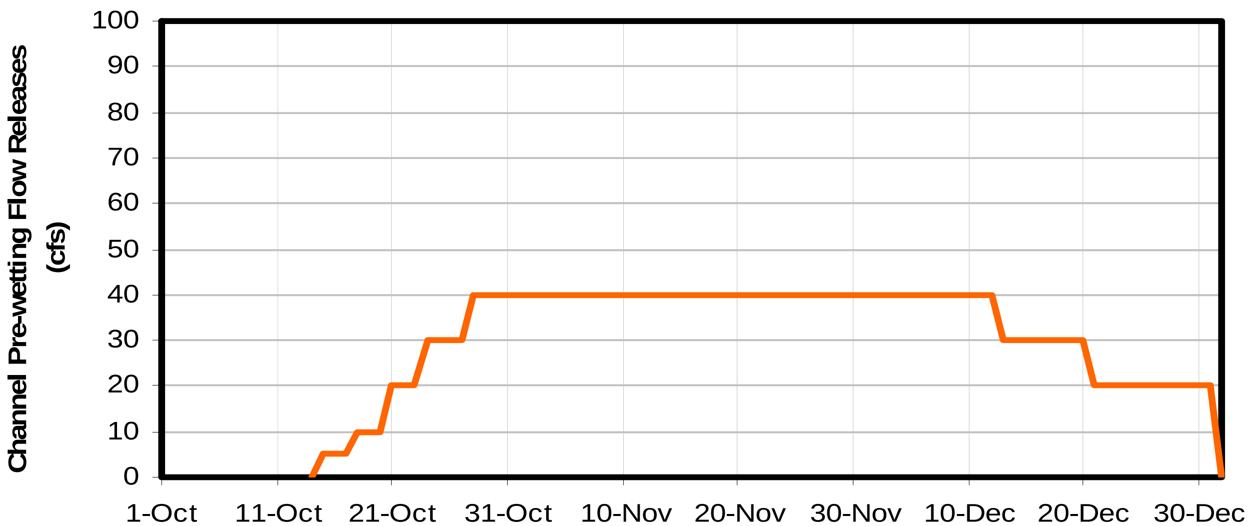

Figure 2. Planned Cosumnes River channel pre-wetting releases from the Folsom South Canal.

The following additional operational criteria will govern releases to achieve Project objectives.

1. Channel pre-wetting flows will be released from the Folsom South Canal beginning on or about October 15, and continue until natural runoff is predicted to create a surface-flow connection with tidewater.
2. The flow-release schedule represents a proposed maximum rate of release. Release rates will be modified, as necessary, to prevent channel erosion at the outlet facility, increase the extent of channel wetting, or improve fish passage conditions.
3. The rate of release of channel-wetting flows will be managed to avoid prematurely creating a surface-flow connection to tidewater. In the event that either the rate of channel wetting releases or a combination of channel wetting releases plus natural run-off creates a connection, the rate of release from the Folsom South Canal will be reduced to avoid an "unnatural" connection.

4. Water not released for channel wetting purposes will be credited to the volume of water allocated for flow augmentation purposes. During most years, the Cosumnes River connects around mid-November and, therefore, will not require the use of the entire 5,000 acre-feet. Water not used for channel pre-wetting will be allocated for surface-flow augmentation following initial connection to tidewater.
5. The flow-release schedule for channel pre-wetting and the volume of water for flow augmentation will be re-evaluated and modified based on results of Project implementation, research findings, and/or coordination with other projects that provide mutually acceptable benefits.

By beginning flow releases on October 15, the Cosumnes River channel would receive approximately 2,400 acre-feet of water prior to the time the river typically has surface flow continuity to tidewater (mid-November). To the extent that water allocated for channel pre-wetting is not required for that purpose, it would be held in reserve and used for sustaining surface-flow continuity during salmon migration or, if excess water is available, for enhancing critical habitat along the Cosumnes River or its tributaries.

Flow-Monitoring Locations

Monitoring flows in the Cosumnes River resulting from natural and/or released flows will require constant field monitoring and reporting during the October 15 through December 31 period. RBI will conduct flow and temperature measurements at two-day intervals at the following five locations along the river (Figure 1) to determine the progress of channel-wetting flows and to determine the need to change Cosumnes River releases from the Folsom South Canal:

1. Rooney Dam (RM 24) – approximately 1.1 miles upstream of the Folsom South Canal,
2. Blodgett Dam (RM 22.8) – approximately 500 feet downstream of the Folsom South Canal,
3. Elk Grove Hop Ranch (RM 16.2) – approximately 6.7 miles downstream of the Folsom South Canal,
4. Mahon Ranch (RM 11.5) – approximately 11.4 miles downstream of the Folsom South Canal,
5. Box Culvert Structure (Oneto Property; RM 6.5) – 16.4 miles downstream of the Folsom South Canal.

Flows from the Michigan Bar USGS gauging station (Figure 1), and precipitation forecasts, will be reviewed daily to assist in managing flow releases.

TASK 2 – FALL-RUN CHINOOK SALMON RUN SIZE (ESCAPEMENT) AND JUVENILE DOWNSTREAM MIGRATION (EMIGRATION) MONITORING

This task will evaluate the effects of the Project on adult and juvenile fall-run chinook salmon migration. Flow needs will focus on the lower critical passage reach, from Folsom South Canal to tidewater, where low-flow barriers have historically existed. The duration and rate of river flow needed at Blodgett Dam immediately downstream of the Folsom South Canal to eliminate all downstream low flow barriers will be a focused evaluation building on information gathered in previous years. The duration and rate of flow needed to maintain successful upstream adult migration will be determined through adaptive management of flow releases from the Folsom South Canal.

Flow needs for successful juvenile downstream migration (emigration) will depend directly on the timing of emigration and the rate at which young salmon travel from the spawning/rearing reaches to tidewater. Screw trap sampling in the lower river in the winter and spring of 2003 indicated that salmon emigrate as fry, fingerlings, pre-smolts, and smolts. This Project's findings, combined with information from past surveys, will be useful in determining flow needs for emigrating salmon. Emigration surveys will, indirectly, provide information on the success of fall spawning in the Cosumnes River.

Run Size (Escapement) Surveys

Field crews will closely monitor critical riffles and barriers during the October through December 2005 migration period to determine the success of adult upstream migration and to determine if additional flows need to be released from the Folsom South Canal to minimize delays in migration and stranding. Ultimately, the distribution of spawners and redds in the river in relation to critical riffles and weirs among and within years, and their relationship to flow, will be the primary indicator of migration delay or hindrance, as well as success of the run reaching spawning habitat in the upper river. Carcass and spawner surveys will be conducted weekly throughout the spawning season to determine spawning distribution, mortality of fish that fail to reach spawning grounds, and total run size or "escapement". In addition, carcasses will be examined for the presence of markings (e.g., fin clips, coded wire tags) indicating whether fish are of hatchery origin. All observations of markings will be recorded for subsequent estimation of straying rates from other (e.g., Mokelumne River) systems. Two independent escapement estimates will be made for adult spawners: (1) carcass tag returns, and (2) redd counts. Estimates will be made of the proportion of the run that passes known barriers to spawning in the Cosumnes River between Latrobe Falls and Meiss Road. During the surveys, this section of the Cosumnes River will be divided into two reaches based on historic protocol and local access to survey crews: (1) Michigan Bar to Highway 16, and (2) Highway 16 to Meiss Road.

Total escapement and escapement relative to improved sites will be estimated using the standard Peterson Index (Lincoln Index) as employed by Snider and Reavis (2000):

$$N = MC/R$$

where,

- N = estimated spawning population,
- M = number of carcasses marked during the survey,
- C = total number of carcasses examined during the survey, and
- R = number of marked carcasses recovered during the survey.

The Petersen index is a consistent estimator of the population size under the following conditions:

1. Either or both of the samples is a simple random sample (i.e., all fish in the population have the same probability of being tagged or all fish have the same probability of being captured in the second sample, or tagged fish mix uniformly with untagged fish).
2. The population is closed.
3. There is no tag loss.
4. The tagging status of each fish is determined without error.
5. Tagging has no effect on the subsequent behavior of the fish.

Employing the Peterson Index under these circumstances has the potential of severe bias (Snider and Reavis 2000, Law 1994); particularly when fish numbers are low (Ricker 1975). If observations at the weirs suggest that the run size on a given year will be low, Bailey's (1951) modification, which allows for multiple recaptures of marked fish, may be employed as an alternative. The equation for the Bailey's Modification is:

$$N = M(C+1)/(R+1)$$

The parameters for Bailey's Modification are the same as the Peterson Index described above.

Escapement also will be estimated by expanding total redd counts by a factor of 2.5. This information also will add to information gathered as part of the AFRP sponsored Project, "***Flow Requirements for Salmon Passage, Cosumnes River, Sacramento County, California***".

Juvenile Downstream Migration (Emigration) Surveys

The FFC will continue to operate a screw trap during the winter-spring juvenile emigration period (typically mid-January to May, depending on initiation of spawning) at river mile 6.7 to estimate emigration timing and production, relative to total escapement. As juvenile salmon migrate downstream, they will be intercepted at a five-foot rotary screw trap. The number of juvenile emigrants will be estimated by using a trap efficiency method of releasing marked fish upstream of the trap. Fish will be marked with Bismark Brown dye prior to being released 1 mile upstream of the trap. Trap efficiency tests will be conducted when numbers captured merit the effort (i.e., when more than 100 fish are available to be marked and released). Trap efficiency will be estimated using a modification to the Petersen estimate from the equation:

$$e = (R+1)/(M+1),$$

where:

- e is the estimated trap efficiency,
- M is the number of marked fish released upstream of the trap, and
- R is the number of marked fish recaptured.

Murphy et al. (1996) listed the standard assumptions of the Petersen method. The same assumptions apply in trap-efficiency experiments: (1) the population is closed, (2) all fish have the same probability of capture in the first sample, (3) marking does not affect catchability, (4) the second sample is either a simple random sample, or if the second sample is systematic, marked and unmarked fish mix randomly, (5) fish do not lose their marks, and (6) all recaptured marks are recognized. Specific performance measures will be juvenile abundance relative to total escapement and emigration timing.

These data will be used to monitor the overall success of emigration and determine rates of migration at various flow rates. Data collected under this monitoring plan will be incorporated with data collected in the fall of 2004 as part of the AFRP-sponsored Project, ***"Flow Requirements for Salmon Passage, Cosumnes River, Sacramento County, California"***.

TASK 3 – GROUNDWATER-SURFACE WATER INTERACTION MONITORING

Professor Graham Fogg, Ph.D., of the Land, Air, and Water Resources and Geology Department at UCD, will lead the Groundwater–Surface Water Interaction Monitoring Task. UCD will either be funded through the SSCAWA, if the SSCAWA and Coalition partners develop the funding for this task, or UCD may fund this task directly.

Ongoing work on hydrogeology of the Cosumnes River aquifer system has shown that the river is the major source of recharge to the local groundwater system, and that most of this recharge probably occurs over a small percentage of the channel between Michigan Bar and Twin Cities Road. Successful management of river flows to sustain salmon migration in the fall requires more detailed information on water exchange between the river and the underlying groundwater aquifer along this entire reach. This more detailed information can be obtained through careful hydrologic monitoring before and after a controlled flow release experiment, wherein a known amount of water is diverted into the channel near the Folsom South Canal. Instrumentation deployed for such an experiment also will be useful for studying interaction between groundwater and surface water in the system on a continuous basis.

Channel Instrumentation

Portions of the Cosumnes River channel between the Folsom South Canal and Twin Cities Road will be instrumented in order to detect, in real time, spatially and temporally varying losses and gains of streamflow due to interplay with groundwater. Observations will attempt to detect key river reaches within which most of the streamflow losses (groundwater recharge) are occurring.

Instrumentation will include the following:

- Automatic monitoring of river bed temperature along 6 to 8 transects to provide higher-resolution information on the rate of downstream movement of flow pulses during dry and wet conditions (100 Tidbit temperature loggers). This also will help detect sub-reaches that are most active in terms of groundwater interaction.

- Additional installation of shallow piezometers in near-channel and floodplain areas to provide more groundwater level information beyond our existing triangular floodplain and Highway 99 sites. This also will help us pin down the role of little-studied and little-understood perched aquifers in regulation of baseflow into the summer and fall months.

- Additional streamflow monitoring at strategic locations.

This task would begin prior to water releases and continue through July 2006.

TASK 4 – PROJECT REPORTING

The SSCAWA and RBI will lead the task of reporting Project activities and results. RBI will provide the SSCAWA and Coalition partners with periodic report of operations for flow management activities, during all periods in which flows are being released. The FFC will provide a report on escapement and juvenile emigration monitoring, approximately 3 months after the completion of emigration monitoring activities. Information gathered by UCD will be included in a report on groundwater and surface water Interaction, approximately 6 months after the completion of monitoring activities.

Project Title: Cosumnes River Flow Augmentation Project - 2005 Demonstration Phase

Project Location - Specific:

Project Location – City: n/a **Project Location – County:** Sacramento County

Description of Project:

The project would release up to 5,000 acre-feet of water from the Folsom South Canal to supplement flows in the lower Cosumnes River during October-December 2005. The purpose is to conduct monitoring to evaluate effectiveness for improving passage of migrating fall-run chinook salmon and to evaluate groundwater recharge rates in the channel. The Bureau of Reclamation would provide B2 surplus water for the project.

Name of Public Agency Approving Project: SSCAWA

Name of Person or Agency Carrying Out Project: SSCAWA

Exempt Status: (*check one*)

- ☐ Ministerial (Sec. 21080(b)(1); 15268);
- ☐ Declared Emergency (Sec. 21080(b)(3); 15269(a));
- ☐ Emergency Project (Sec. 21080(b)(4); 15269(b)(c));
- ☑ Categorical Exemption. State type and section number: Class 6, Sec. 15306
- ☐ Statutory Exemptions. State code number:

Reasons why project is exempt:

The project would not involve any construction or operation disturbances to environmental resources and would specifically benefit anadromous fish production goals. No regulatory permits or appprovals are required for the project. Fisheries and hydrologic data would be collected to aid design of the future long-term operations. None of the exceptions under CEQA Guidelines Section 15300.2 apply to the project.

CATEGORICAL EXCLUSION CHECKLIST

Project: Cosumnes River Augmentation Pilot Study **Date:** 9/19/2005

Nature of Action: Local groundwater withdrawals over the past 50 years have substantially lowered groundwater tables and reduced the Cosumnes River and Deer Creek baseflow. The Cosumnes River now ceases to flow earlier in the year, stays dry longer into the fall, and dries over an increasingly long reach compared to historic conditions. Because of the increase over time in the number of days that the river is dry each year, it requires more surface flow from the upper watershed to re-wet the channel and connect the surface flow from the upper watershed to re-wet the channel and connect the Cosumnes River to the Delta. Cosumnes River surface flows supporting aquatic and riparian habitats and species have been diminished, thereby reducing the quality and quantity of those habitats and associated species. The objective of this project, to improve fall salmon migration conditions, would be accomplished by: (1) allowing the Cosumnes River to connect to tidewater earlier in the fall; (2) sustaining the flow of the Cosumnes River after its initial connection; and, (3) redistributing excess water for improvement and maintenance of fish passage flows on the Cosumnes River. This pilot study is designed to demonstrate the effectiveness of using limited surface water supplies to meet multiple objectives of improving conditions for key aquatic communities as part of an integrated regional water management strategy. In the initial year, some of the basic assumptions will be tested, operational issues will be addressed, and fishery and hydrologic conditions will be monitored.

The water source for this pilot study would be 5,000 acre-feet of previously banked CVP project storage accounted for as a portion of the supply annually dedicated under §3406(b)(2) of the Central Valley Project Improvement Act for the primary purpose of implementing the fish, wildlife, and habitat restoration purposes.

Exclusion Category: D.12. Conduct of programs of demonstration, educational, and technical assistance to water user organizations for improvement of project and on-farm irrigation water use and management.

Evaluation of Criteria for Categorical Exclusion

1. This action or group of actions would have a significant effect on the quality of the human environment. No x Uncertain ____ Yes______

2. This action or group of actions would involve unresolved conflicts concerning alternative uses of available resources. No x Uncertain ____ Yes______

Evaluation of Exceptions to Actions within Categorical Exclusion

1. This action would have significant adverse affects on public health or safety. No x Uncertain ____ Yes______

2. This action would affect unique geographical features as: wetlands, wild or scenic rivers, refuges, floodplains, etc. No x Uncertain ____ Yes______

3. The action will have highly controversial environmental effects. No x Uncertain ____ Yes______

4. The action will have highly uncertain environmental effects or involve unique or unknown environmental risk. No x Uncertain ____ Yes_____

5. This action will establish a precedent for future actions. No __x__ Uncertain ____ Yes________

6. This action is related to other actions with individual insignificant but cumulatively significant environmental effects. No __x__ Uncertain ____ Yes_______

7. This action will affect properties listed or eligible for listing in the National Register of Historic Places. No __x__ Uncertain ____ Yes_______

8. This action will adversely affect species listed or proposed to be listed as Endangered or Threatened. No __x__ Uncertain ____ Yes______

CATEGORICAL EXCLUSION CHECKLIST
(Continued)

9. This action threatens to violate Federal, State, local or tribal law or requirements imposed for protection of the environment. No __x__ Uncertain ____ Yes______

10. This action will affect Indian Trust Assets. No__x__ Uncertain ____ Yes________

11. This action will disproportionately affect minority or low-income populations. No __x__ Uncertain ____Yes_______

NEPA Action: Categorical Exclusion

Remarks / Comments: Reclamation has determined that the proposed action is appropriate for Categorical Exclusion under the National Environmental Policy Act of 1969 (42 United States Code [U.S.C.] 4321, et seq.) based on the following information:

- The project is designed to be beneficial by supporting the restoration of more normative ecological conditions within the lower watershed;
- The quality of the water to be used is very good and would not cause an adverse impact to native biota or groundwater. Local proponents have consulted with the Regional Water Quality Control Board;
- The inter-basin movement of water would not induce additional straying of salmonids from neighboring watersheds due the timing and magnitude of the application of available source supply (e-mail communication from C. Ingram, US Fish and Wildlife Service, 9/16/05);
- There would be no effect to threatened steelhead because the presence of a natural barrier to upstream migration at a point upstream for the point of deliver has historically excluded steelhead from suitable spawning habitat. The Cosumnes Rive is not considered to provide any critical habitat for steelhead.

1 INTRODUCTION

The Southeast Sacramento County Agricultural Water Authority (SSCAWA) will be undertaking the Cosumnes River Flow Augmentation Project (Project) – 2005 Demonstration Phase from October through December 2005. The activity is specifically designed to collect basic operational and research information to refine a long-term program of fisheries enhancement and groundwater recharge. Because the activity will not cause adverse environmental effects, the Project qualifies for a categorical exemption as outlined in State California Environmental Quality Act (CEQA) Guidelines Sections 15061, 15062, and 15306. The following information describes the activities that will occur during the demonstration phase of the Project and the regulatory determination for supporting a CEQA categorical exemption.

2 PROJECT DESCRIPTION

2.1 Introduction

The Cosumnes River is a keystone of anadromous salmon fishery conservation efforts in the North Delta. The Anadromous Fish Restoration Program (AFRP), The Nature Conservancy (TNC), and the University of California, Davis (UCD), have sponsored numerous research projects on the health of the salmon fishery of the Cosumnes River. Historical decline of the Cosumnes River fall-run chinook salmon (*Oncorhynchus tshawytscha*) populations are apparently due to the altered hydrology of the system during the critical salmon migration period coupled with a short supply of suitable spawning and rearing habitat. AFRP has identified the Cosumnes as having potential for contributing to the fish doubling goals of the Central Valley Project Improvement Act (CVPIA). The AFRP has also set forth program objectives specifically directed at the Cosumnes River and the acquisition and restoration of fish habitat, primarily directed at improving passage and spawning habitat for fall-run chinook salmon.

The geologic setting and unregulated nature of the Cosumnes River has also made it a focus of regional water management strategies for south Sacramento County, and particularly for SSCAWA and its member district, Omochumne-Hartnell Water District (OHWD), through which the Cosumnes River flows. SSCAWA and OHWD, in partnership with the Sacramento County Water Agency (SCWA), TNC, and UCD are sponsoring a number of programs aimed at evaluating and developing a conjunctive use strategy that capitalizes on the natural geology of the region for groundwater recharge and surface water management.

Recent field and modeling efforts conducted by UCD researchers and others indicate that extensive regional and local groundwater withdrawals over the past 50 years substantially lowered groundwater tables and reduced the base flow of the Cosumnes River and its major tributaries. The Cosumnes River now frequently ceases to flow during summer months, stays dry longer into the fall, and has a dry river bed over an increasingly longer reach compared to historical conditions.

A Coalition of interests[1] support this project that will provide supplemental flows to the Cosumnes River to improve fish passage for fall-run chinook salmon and provide a controlled environment to evaluate the interaction of groundwater and surface water in the Cosumnes River channel. Figure 1 shows the project area and major features. The objectives of the Project are twofold:

- To improve fall-run chinook salmon migration conditions by: (1) allowing the Cosumnes River to connect to tidewater earlier in the fall, and (2) sustaining surface flow continuity within the Cosumnes River after its initial connection.

- To evaluate the rate of groundwater recharge from the river channel between the Folsom South Canal and Twin Cities Road to better guide future groundwater management and environmental restoration efforts along the Cosumnes River corridor.

2.2 Demonstration Project Operations

The Project will release up to 5,000 acre-feet (af) of water into the Cosumnes River starting on or about October 15, 2005, from an existing turnout of the Folsom South Canal. The Folsom South Canal diverts water from the lower American River at Lake Natoma and conveys it to the south Sacramento County area. The Project is designed to create river conditions similar to what might have been experienced prior to the reduction of groundwater levels underlying the Cosumnes River between Highway 16 and the Cosumnes River Preserve (downstream of Twin Cities Road). The Project is not intended to create a hydraulic connection with the tidally influenced area of the Cosumnes River and the Delta before it would historically have occurred naturally from run-off generated by fall precipitation in the Sierra Nevada foothills.

The intent of the Coalition is that the Project continue into a Pilot Project phase from 2006 through 2010, after which it will become a permanent annual operation. Hence, the 2005 effort constitutes a demonstration phase to help the project proponents develop and improve the long-term management strategy of the Project. Sacramento County Water Agency (SCWA) will provide the long-term water supply for the Project using water developed from the Eastern Sacramento County Replacement Water Supply Project (RWSP). CEQA compliance for the

[1] The Coalition consists of the Sacramento County Water Agency, The Nature Conservancy, Southeast Sacramento County Agricultural Water Authority (members include Omochumne-Hartnell Water District, Galt Irrigation District, and Clay Water District), Fisheries Foundation of California, and the UCD Center for Integrated Watershed Science and Management.

Pilot Project phase (2005–2010) will be prepared by the end of 2005, and any necessary regulatory permits or approvals for construction of permanent features associated with the Project would be secured in early 2006.

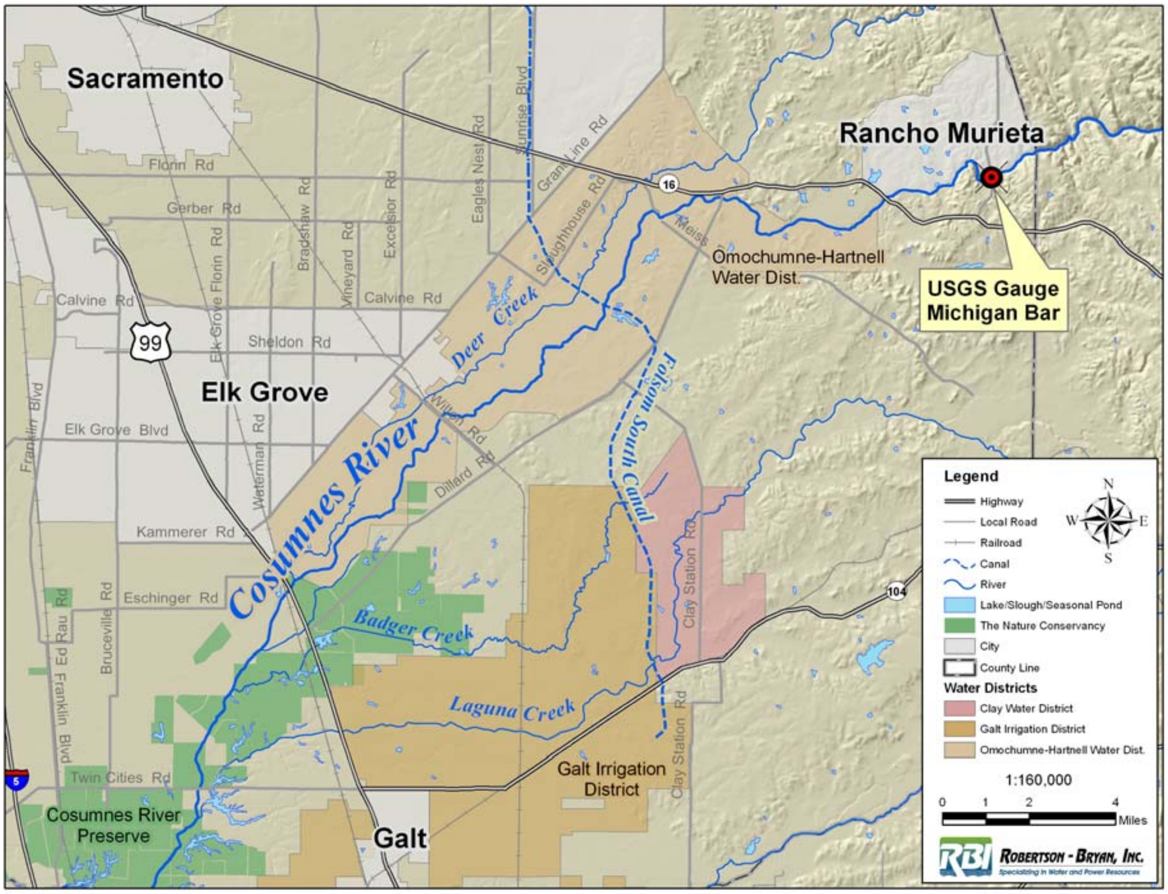

Figure 1. Location map for the Cosumnes River Flow Augmentation Project.

Demonstration Phase Water Supply

The U.S. Bureau of Reclamation (Reclamation) and the B2 Environmental Water Program will provide the water supply for the demonstration phase of the Project. Up to 40 cubic feet per second (cfs) will be diverted from the American River system, supplied from storage in Folsom Reservoir, between October 15 and December 31. This water is allocated to the B2 Environmental Water Program and, as such, will be diverted entirely from storage, thereby leaving streamflow in the American River unaffected. Water released from Folsom Reservoir for the Project will fall within Reclamation's normal operating ranges for the fall period.

Flow Release Operations

The demonstration phase of the Project will not require construction or physical alteration of existing facilities, streambed or streambank modifications, or vegetation removal to implement the release of water from the Folsom South Canal to the Cosumnes River. Releases will be made from the canal via an existing outlet structure on the canal abutment on the south side of the Cosumnes River. The outlet structure consists of an operable gate located on the canal leading into a buried 48-inch pipeline. The gravity-fed pipeline terminates on the south bank of the river, approximately three feet above the normal water surface elevation. Releases will be controlled and monitored to ensure that the hydraulic energy of the water entering the river does not cause adverse localized channel or streambank scour, erosion, or excessive turbidity in the water column. In addition, there is natural streamflow in the Cosumnes River in this section of the river because of the large 2004-05 winter snowpack in the Sierra Nevada. Existing streamflow currently extends downstream to the vicinity of Wilton Road (river mile 15) where percolation into the stream channel is complete and the channel becomes dry from that point downstream to the area of tidal influence (river mile 5). Natural streamflow is expected to continue through the 2005 implementation period. The existing streamflow will also serve to dissipate the hydraulic energy of the discharge from the canal, eliminating the need for streambed erosion controls.

Figure 2 depicts the flow release schedule developed to meet the following criteria: (1) pre-wet the greatest length of channel possible without reaching the tidally influenced area, and (2) maintain sufficient water in reserve for augmenting river flow to sustain the connection with tidewater during the optimal salmon migration period of November 1 to December 31.

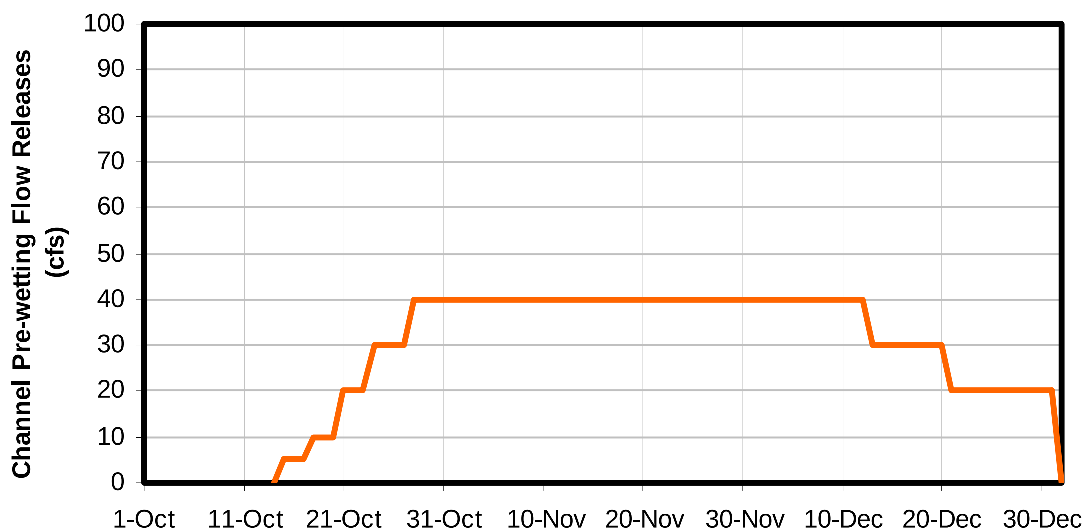

Figure 2. Cosumnes River channel pre-wetting releases from the Folsom South Canal.

Channel pre-wetting flows will begin on or about October 15 and continue through December 31. By beginning flow releases in mid-October, the Cosumnes River channel will receive approximately 2,400 af of water before the river typically connects to tidewater in mid-November. Water not used for channel pre-wetting will be reserved and used to supplement natural flows through December 31 in an effort to eliminate stranding conditions during the migration period. Flow augmentation releases will be made when Cosumnes River flows fall below that required to maintain upstream migration conditions, estimated to be 65–70 cfs, measured at the U.S. Geological Survey (USGS), Michigan Bar gauging station. Historical flow records for the Cosumnes River, with consideration of today's groundwater conditions, indicate that supplemental flows to maintain barrier-free migration conditions would be needed in about 93% of years.

2.3 Monitoring Program

SSCAWA and partner organizations of the Coalition will conduct fisheries and hydrologic monitoring as an element of the Project. Information developed by the monitoring efforts will be used to refine Project operations and to assist in the development of the long-term streamflow augmentation program for improvement of fall-run chinook salmon migration conditions in the Cosumnes River.

Flow Release Scheduling

SSCAWA will take the lead in scheduling and managing releases from the Folsom South Canal. On behalf of SSCAWA, Robertson-Bryan, Inc. (RBI) will facilitate the task of flow release scheduling and management. RBI will perform field measurements of flows to monitor the effect of releasing channel-wetting flows and regulate flow releases as needed to meet the multiple objectives of the Project. RBI will coordinate with all members of the Coalition, Reclamation, and permitting and other regulatory authorities regarding flow releases, as needed.

Fall-run Chinook Salmon Run Size (Escapement) and Juvenile Downstream Migration (Emigration) Monitoring

The Fisheries Foundation of California (FFC) will monitor the abundance, distribution, and lifestage-specific migration timing of fall-run chinook salmon in the Cosumnes River and compare these data to historical data to determine Project effectiveness. This task will evaluate the adequacy of flows for salmon passage by life stage. Flow needs will focus on the lower river reach, from below the Folsom South Canal to the tidal area, where passage of migrating adult salmon presents the biggest problem. The duration and rate of flow needed to allow the run to proceed upstream and successfully reach spawning grounds will be a focused evaluation building on information gathered in previous years. The duration and rate of flow needed to maintain a successful migration pattern will be determined through adaptive management of flow releases from the Folsom South Canal. The FFC will also conduct out-migration surveys to provide information on the relative success of fall spawning in the Cosumnes River.

Groundwater-Surface Water Interaction Monitoring

Professor Graham Fogg, Ph.D., of the Land, Air, and Water Resources and Geology Department at UCD, will lead the Groundwater–Surface Water Interaction Monitoring task. Ongoing work on hydrogeology of the Cosumnes River aquifer system has shown that the river is the major source of recharge to the local groundwater system and that most of this recharge probably occurs over a small percentage of the channel between Michigan Bar and Twin Cities Road. Successful management of river flows to sustain salmon migration in the fall requires more detailed information on river–aquifer water exchange along this entire reach. This more detailed information can be obtained through careful hydrologic monitoring before and after a controlled flow release experiment, wherein a known amount of water is diverted into the channel near Folsom South Canal. Instrumentation deployed for such an experiment will also be useful for studying interaction between groundwater and surface water in the system on a continuous basis.

3 PROJECT DETERMINATION

In compliance with the State CEQA Guidelines, the potential environmental effects of the demonstration phase of the Project were evaluated and it was determined that its implementation is exempt from CEQA under the State CEQA Guidelines; specifically, Title 14, California Code of Regulations (CCR) Section 15061(b)(3), and subject to a Category Exemption under Title 14, CCR Section 15306 (Class 6, Information Collection).

Pursuant to CEQA, a categorical exemption provides for an exemption from CEQA environmental documentation requirements for a class of projects determined not to have a significant effect on the environment. The demonstration phase of the Project is consistent with the designated Class 6 categorical exemption and thus determined to be exempt from the provisions of CEQA. The Class 6 – Information Collection class of categorical exemptions is defined as follows:

> *Class 6 consists of basic data collection, research, experimental management, and resource evaluation activities, which do not result in a serious or major disturbance to an environmental resource. These may be strictly for information gathering purposes, or as part of a study leading to an action, which a public agency has not yet approved, adopted, or funded.*

The demonstration phase of the Project meets this definition in that the Project serves to develop and evaluate research data in support of planning and design options for long-term resource management that would benefit anadromous fisheries and groundwater recharge in the Cosumnes River. Additionally, any subsequent projects that would be developed to address this problem have not yet been approved, adopted, or funded by SSCAWA.

In addition, the demonstration phase of the Project is covered by the general rule that CEQA does not apply to activities where it can be seen with certainty that there is no possibility that a significant effect on the environment could occur (State CEQA Guidelines Section 15061[b][3]). The project consists of a temporary discharge of American River water from the Folsom South Canal to the Cosumnes River for the specific purpose of anadromous fisheries enhancement and groundwater recharge. Thus, the Project is similar to a temporary water transfer program for which the State Water Resources Control Board has found to be subject to a CEQA Statutory Exemption under State CEQA Guidelines Section 15282(v) and the California Water Code, Section 1729.

Reclamation has determined that the use of B2 Environmental Water for the Project is consistent with Reclamation policy for a Categorical Exclusion for the "Conduct of programs of demonstration, educational, and technical assistance to water user organizations for improvement of project and on-farm irrigation water use and management" pursuant to the National Environmental Policy Act (NEPA), Code of Federal Regulations (CFR) Section 1508.4.

No other local, state, or federal regulatory approvals or permits are required for implementation of the Project.

3.1 Analysis of Potential CEQA Exceptions to the Categorical Exemption

Categorical exemptions represent activities that generally do not result in significant environmental impacts. However, there are six exceptions to categorical exemptions, defined in CEQA Guidelines Section 15300.2. Generally, a categorical exemption does not apply if a project would occur in certain specified sensitive environments, would affect scenic resources within official state scenic highways, or is located on a designated hazardous waste site. In addition, a categorical exemption would not apply if the project causes substantial adverse changes in the significance of a historical resource or would be considered significant within a cumulative context. Table 1 identifies specific exceptions from CEQA Guidelines Section 15300.2 and a brief discussion as to why each exception does not apply to the demonstration phase of the Project.

Table 1. Categorical Exemption Exceptions (CEQA Guidelines Section 15300.2)

Exception	Applicability
(a) Location. Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located—a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant. Therefore, these classes are considered to apply in all instances, except where the project may impact an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.	The Project is specifically designed to benefit fisheries resources and local water supplies associated with Cosumnes River where resource conditions are known to be limited by the historical reduction in favorable seasonal streamflow conditions. Central Valley steelhead are threatened under the federal Endangered Species Act and the Mokelumne River downstream of the project area is designated critical habitat for steelhead. The Project will not create early attraction flows or false attraction flows that would lead to straying of fish from their native stream of origin. In addition, the Project would not involve any construction activity or operations that would cause an impact to any resource of hazardous or critical concern.
(b) Cumulative Impact. All exemptions for these classes are inapplicable when the cumulative impact of successive projects of the same type in the same place, over time is significant.	Resource data collection conducted during the Project will specifically be used to refine the design of the long-term streamflow augmentation project. Consequently, it is anticipated that the long-term project will be constructed and operated so as to not cause any significant cumulative environmental effects.
(c) Significant Effect. A categorical exemption shall not be used for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.	The proposed study design incorporates measures to ensure that no significant impacts will occur as a result of study activities. These include manually controlling and monitoring the flow augmentation operations, conducting hydrologic and fisheries monitoring downstream of the discharge to ensure that adverse effects do not occur, and using the data that is collected to refine the design of the long-term flow augmentation project.

Table 1. Categorical Exemption Exceptions (CEQA Guidelines Section 15300.2)

Exception	Applicability
(d) Scenic Highways. A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. This does not apply to improvements, which are required as mitigation by an adopted negative declaration or certified EIR.	There are no officially designated state scenic highways in the proposed study area. The Project will not cause any aesthetic effects.
(e) Hazardous Waste Sites. A categorical exemption shall not be used for a project located on a site, which is included on any list compiled pursuant to Section 65962.5 of the Government Code.	The Project does not involve any construction or operations that would disturb, and/or alter the fate and transport, of any known or unknown hazardous waste sites.
(f) Historical Resources. A categorical exemption shall not be used for a project, which may cause a substantial adverse change in the significance of a historical resource.	The Project does not involve any construction or operations that would disturb any known or unknown cultural resources.

3.2 Environmental Impact Analysis

The following briefly describes the environmental setting in the project area, the environmental effects of the demonstration phase of the Project, and supporting evidence for this categorical exemption.

Biological Resources

The Cosumnes River is a tributary of the Mokelumne River. The discharge location is approximately 23 river miles upstream of the confluence of the two rivers. The Mokelumne River supports an annual run of Central Valley Evolutionarily Significant Unit (ESU) steelhead (*Oncorhynchus mykiss*), which are listed as threatened under the federal Endangered Species Act, and the Mokelumne River is within the designated critical habitat for the species. Anecdotal evidence suggests that Central Valley ESU steelhead may occur, seasonally, in the Cosumnes River upstream of Rancho Murrieta during some years. However, the Cosumnes River is excluded from the critical habitat designation, and steelhead occurring in the Cosumnes River are likely strays from the Mokelumne River. It is highly unlikely that the Cosumnes River can support a naturally reproducing steelhead population because juvenile fish rear in their natal streams for a period of one to three years and require perennial flow and cool summertime water temperatures during this rearing period. The Cosumnes River does not provide perennial flows and cool summertime water temperatures below Latrobe Falls, the section of the river accessible to steelhead.

It is unlikely that steelhead from the American River or Mokelumne River will be falsely attracted into the Cosumnes River, or attracted earlier than would occur without the Project, for several reasons. First, American River water will be used to “pre-wet” dry reaches of the Cosumnes River channel primarily during October and November and possibly into December (depending on when initial rains occur). Because the time at which active flow will extend to the tidal area from the discharge location will not differ appreciably from existing conditions, the discharge will not produce early attraction flow. Second, adult American River steelhead migrate upstream through the Sacramento River and are primarily attracted by a combination of olfactory cues and increased flows. Transferred water will be diluted by Cosumnes River, Mokelumne River, and numerous other tributaries to the extent that it is not expected to alter the migratory cues for American River steelhead coming up through the Delta to levels that would cause them to stray, with greater frequency, into the Cosumnes River. The small and short-term increase in flows will be regulated to pre-wet the Cosumnes River channel only, and will not be substantial enough to artificially create or increase attraction flows at the confluence of the Mokelumne and Cosumnes rivers. In addition, monitoring of the fisheries and hydrologic conditions will occur during the Project.

Folsom and Nimbus operations will not be affected by the demonstration phase of the Project. The Project will not adversely affect coldwater pool management at Folsom Reservoir, nor will it alter lower American River flows or temperatures.

Hydrology and Water Quality

The temporary interbasin transfer of water from the American River to the Cosumnes River would not cause or contribute to any substantial adverse hydrologic or water quality effects. American River water and Cosumnes River water physical and chemical characteristics are generally similar with respect to their origin from Sierra Nevada sources and suitability for designated beneficial uses supported in both rivers.

Other CEQA Issues

The demonstration phase of the Project will have no other direct or indirect environmental effects for CEQA resource issues of concern (i.e., aesthetics, agricultural resources, air quality, cultural resources, geology and soils, hazards and hazardous materials, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation/ traffic, utilities and service systems) or any cumulative impacts.

MEMORANDUM

DATE: SEPTEMBER 15, 2005

TO: DAVE ROBINSON, US BUREAU OF RECLAMATION

FROM: LARRY RODRIGUEZ
DAVE THOMAS
MICHAEL BRYAN

PROJECT: COSUMNES RIVER FLOW AUGMENTATION PROJECT

SUBJECT: NO ADVERSE AFFECT TO CENTRAL VALLEY STEELHEAD

Robertson-Bryan, Inc. (RBI) has prepared the following to support the U.S. Bureau of Reclamation's (Reclamation) determination of no adverse affect to Central Valley Evolutionarily Significant Unit (ESU) steelhead or designated critical habitat as a result of implementation of the demonstration phase of the Cosumnes River Flow Augmentation Pilot Project using water available through the B2 Environmental Water Program.

Anecdotal evidence suggests that Central Valley ESU steelhead (*Oncorhynchus mykiss*) may occur seasonally in the Cosumnes River upstream of Rancho Murrieta during some years. Central Valley ESU steelhead are currently listed as threatened under the federal Endangered Species Act (63 FR 13347, May 18, 1998); no State designation has been made. NOAA Fisheries issued its final designation for critical habitat on September 2, 2005 (50 CFR Part 226). The designation includes the Mokelumne River; however, the Cosumnes River was considered and excluded because the watersheds containing this river were of "…low conservation value." Steelhead occurring in the Cosumnes River are likely strays from the Mokelumne River, which supports an annual run of steelhead. In contrast, it is unlikely that the Cosumnes River can support a naturally reproducing steelhead population because juvenile fish rear in their natal streams for a period of one to three years and require perennial flow and cool summertime water temperatures during this rearing period. The Cosumnes River does not provide perennial flows and cool summertime water temperatures below Latrobe Falls, the section of the river accessible to steelhead. Latrobe Falls, located at river mile 40 where elevation is approximately 350 feet (msl), is a natural barrier to upstream migration

The proposed Pilot Project will augment the natural flow regime of the Cosumnes River with American River water conveyed through the Folsom South Canal. The potential adverse effects of such an action on Central Valley ESU steelhead include: (1) false attraction of non-natal (i.e., American River- or Mokelumne River-derived) fish into the Cosumnes River as a result of the inter-basin water transfer, (2) early attraction and potential stranding of steelhead because of early hydraulic connectivity, and (3) adverse alteration of designated critical habitat, including habitats of the lower American River.

It is unlikely that steelhead from the American River or Mokelumne River will be falsely attracted into the Cosumnes River, or attracted earlier than would occur without the Pilot Project, for several reasons. First, American River water will be used to “pre-wet” dry reaches of the Cosumnes River channel primarily during October and November and possibly into December (depending on when initial rains occur). Second, adult American River steelhead migrate upstream through the Sacramento River and are primarily attracted by a combination of olfactory cues and increased flows. Transferred water will be diluted by Cosumnes River, Mokelumne River, and numerous other tributaries to the extent that it is not expected to alter the migratory cues for American River steelhead coming up through the Delta to levels that would cause them to stray, with greater frequency, into the Cosumnes River. The small and short-term increase in flows will be regulated to pre-wet the Cosumnes River channel only, and will not be substantial enough to artificially create or increase attraction flows at the confluence of the Mokelumne and Cosumnes rivers.

It is unlikely that critical habitat will be adversely affected by increases in flow for several reasons. First, the Cosumnes River, which will be directly affected by the Pilot Project, is not designated critical habitat for steelhead. Second, increases in flow will be short-term in nature. Third, the incremental increase in flow will be small in the Cosumnes River and negligible in the Mokelumne River, thereby leaving critical habitat virtually unaffected. The American River, which also is designated critical habitat for steelhead, will not be adversely affected by the Pilot Project. The water to be diverted (up to 40 cfs) from the American River system will be taken from storage in Folsom Reservoir between October 15 and December 31. This water is allocated to the B2 Environmental Water Program and, as such, will be diverted entirely from storage, thereby leaving stream flow in the American River unaffected. Water released from Folsom Reservoir for the Pilot Project will fall within Reclamation’s normal operational parameters for the fall period. Folsom and Nimbus operations are not anticipated to be affected by the Pilot Project. Any minor effect on operations would not adversely affect coldwater pool management at Folsom Reservoir, nor would it alter lower American River flows or temperatures by magnitudes that would adversely affect steelhead or critical habitat.

For the reasons stated herein, the proposed Pilot Project will not adversely affect Central Valley ESU steelhead or designated critical habitat.

MEMORANDUM

Date: October 12, 2005

To: David Robinson, US Bureau of Reclamation

From: Larry Rodriguez

Project: Cosumnes River Flow Augmentation Project

Subject: Flow Release Scheduling

On behalf of the Southeast Sacramento County Agricultural Water Authority (SSCAWA), Robertson-Bryan, Inc. (RBI) prepared this memorandum to provide US Bureau of Reclamation (Reclamation) with an updated flow release schedule and communication protocols for the Cosumnes River Flow Augmentation Project – Demonstration Phase (Project). Conditions in the Cosumnes River, readiness of Folsom South Canal (FSC) turnout facilities, and the timing of the availability of US Bureau of Reclamation (Reclamation) water supplies have prompted these changes to the release schedule provided to Reclamation in the Project Monitoring Plan (September 26, 2005).

Release Schedule

The Monitoring Plan indicates that releases from the FSC will be ramped up to 40 cubic-feet-per-second (cfs) beginning on October 15. The intent of ramping flows was to first wet then fill the in-channel pool located at the FSC crossing, presuming that the channel is typically dry in October. However, the Cosumnes River at the FSC crossing is currently flowing at about 16 cfs, therefore, we do not feel the need to ramp up flows to 40 cfs. Instead, we are requesting that Reclamation start releases at 40 cfs. RBI will monitor releases to ensure that no excessive erosion occurs. If it is determined that releases need to be reduced to avoid erosion, RBI will request a change from Reclamation.

RBI is requesting that Reclamation adopt the following schedule to facilitate the initial release of water and to allow for channel erosion evaluation.

- **Monday October 17, 2005, 10:00 –** Release begin at a rate of 40 cfs. First releases will be coordinated with a project initiation ceremony and media coverage.
- **Thursday October 20, 2005, afternoon –** Shut off releases to allow for channel erosion evaluation on Friday morning.
- **Friday October 21, 2005, afternoon –** Reinitiate releases at a rate determined by RBI. Flows will be maintained at the determined rate until natural river flows increase or the channel

wetting front progresses to downstream of Twin Cities Road. RBI will determine when changes to releases are needed and will notify Reclamation of the needed change. Requests for changes in releases will be made 3 days prior to needed change.

As a component of the monitoring program, RBI will conduct regular flow measurements in the Cosumnes River. Flow monitoring locations include the seasonal dam located immediately downstream of the FSC and a location above the FSC that captures the inflow to the in-channel pool formed at the FSC crossing. These monitoring points will assist RBI and Reclamation in calibrating the releases from the FSC. All flow measurements and FSC meter readings will be conducted by RBI at two-day intervals and will be recorded onto a project data sheet that will be distributed to all project partners.

Communication Protocols

RBI will direct all communication for changes in release rates to the following parties:

1. David Robinson via phone at (916) 979-7179 and email at drobinson@mp.usbr.gov,
2. Dave Lawson via email at dlawson@mp.usbr.gov and by phone at (916) 979-7233, if David Robinson is not available, and
3. James Taylor via email at jtaylor@mp.usbr.gov and by phone at (916) 979-7252, if either David Robinson or Dave Lawson are not available.
4. In the case of an emergency, RBI will contact the Reclamation Control Room at (916) 979-7251.

RBI will direct regular communications of project status and flow reporting to David Robinson and Dave Lawson via email.

Reclamation will direct all communications regarding release management to following parties:

1. Brook Edwards via phone at (916) 714-8351 (office) or (916) 216-7330 (cell phone), and by email at brook@robertson-bryan.com,
2. Larry Rodriguez via email at larry@robertson-bryan.com, or by phone at (916) 714-1806 (office) or (916) 212-4678 (cell phone), if Brook Edwards is not available, and
3. Stuart Robertson via phone at (916) 687-7799, if either Brook Edwards or Larry Rodriguez is not available.

Reclamation will direct all general communications about project status and management to Larry Rodriguez.

MEMORANDUM

Date:	November 18, 2005
To:	B2 Environmental Water Program – Interagency Management Team
From:	***Project Partners:*** The Nature Conservancy Fisheries Foundation of California Southeast Sacramento County Agricultural Water Authority ***Project Management Team (RBI):*** Larry J. Rodriguez David Thomas Michael Bryan, Ph.D.
Project:	Cosumnes River Flow Augmentation Project
Subject:	Proposed Operational Changes to the Cosumnes River Flow Augmentation Project

INTRODUCTION

The operational approach for the Demonstration Phase of the Cosumnes River Flow Augmentation Project (Project) is being reconsidered in light of current conditions on the Cosumnes River, and the small amount of allocated water used to date. Due to rather unique hydrologic conditions this year, it required only 760 acre-feet (ac-ft) of B2 water to "pre-wet" the river channel, which was the original goal of the Project. Although the channel is now pre-wetted, there have been no significant precipitation events and none are projected in the near future. Salmon are likely waiting to enter the Cosumnes River, but cannot due to the lack of surface flow continuity between the tidal reach and the upper watershed. Based on this situation, coupled with availability of over 4,000 ac-ft of allocated water, we now propose to release water from the Folsom South Canal sufficient to attract salmon into the river and ultimately to historic spawning reaches. The Project partners have determined that creating an attraction flow would be a reasonable use of available water and would offer a unique opportunity to assess numerous additional research questions regarding salmon behavior.

This memorandum provides a summary of the original project objectives and operations, 2005 operations and conditions, and proposed next steps for the Demonstration Phase of the Project.

PROJECT OBJECTIVES AND OPERATIONS

The intent of the 2005 Demonstration Phase of the Project is to allow the Project partners to refine and improve the long-term operations plan for the Project. During the Demonstration Phase up to 5,000 acre-feet (ac-ft) of water is available from the B2 Environmental Water Program and the U.S. Bureau of Reclamation (Reclamation). The objectives of the Project are twofold:

- To improve fall-run chinook salmon migration conditions by: (1) allowing the Cosumnes River to connect to tidewater earlier in the fall, and (2) sustaining surface flow continuity within the Cosumnes River after its initial connection.

- To evaluate the rate of groundwater recharge from the river channel between the Folsom South Canal and Twin Cities Road to better guide future groundwater management and environmental restoration efforts along the Cosumnes River corridor.

To achieve the above objectives the Project design is to create river conditions similar to what might have existed prior to the reduction of groundwater levels underlying the Cosumnes River. This historical condition is a "gaining" riverine system connected to and receiving water input from the underlying groundwater table. This system would have remained wet, if not flowing, in all but the driest of conditions and flow would have been reestablished each fall with even small amounts of precipitation in its watershed.

The Project will accomplish this by releasing pre-wetting flows into the Cosumnes River from the Folsom South Canal (Figure 1). Pre-wetting release will be managed to wet the river channel from the Folsom South Canal to Twin Cities Road beginning on October 15 and continue through December 31, depending

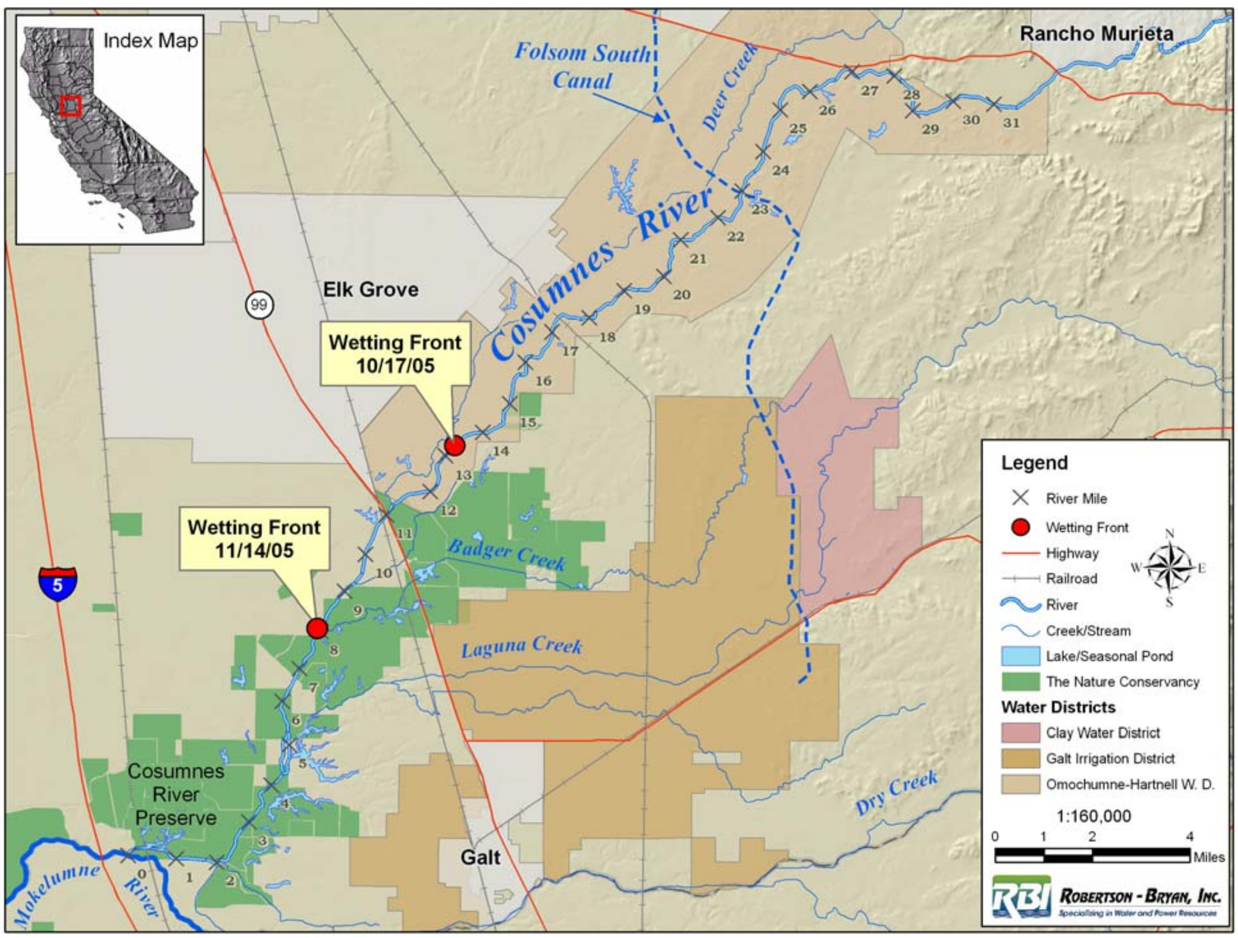

Figure 1. Cosumnes River Flow Augmentation Project location map.

on precipitation and natural flow conditions. Figure 2 shows the schedule for pre-wetting flow releases. Creating a connection with tidewater during the pre-wetting phase will be avoided to avoid attracting salmon into the river during the pre-wetting phase. During the pre-wetting period the Cosumnes River upstream of the Folsom South Canal is typically dry or has very little flow and, therefore, conditions above the canal would not support salmon passage or provide adequate spawning habitat.

Water not used for pre-wetting will be available to augment natural flows through December 31 to eliminate stranding conditions after a natural connection with tidewater is been established. Flow augmentation releases will be made when Cosumnes River flows fall below that required to maintain upstream migration conditions, estimated to be 65–70 cubic feet per second (cfs), measured at the Michigan Bar gauging station. Historical flow records for the Cosumnes River, with consideration of today's groundwater conditions, indicate that 93% of all years would require supplement releases to maintain migration conditions through December 31.

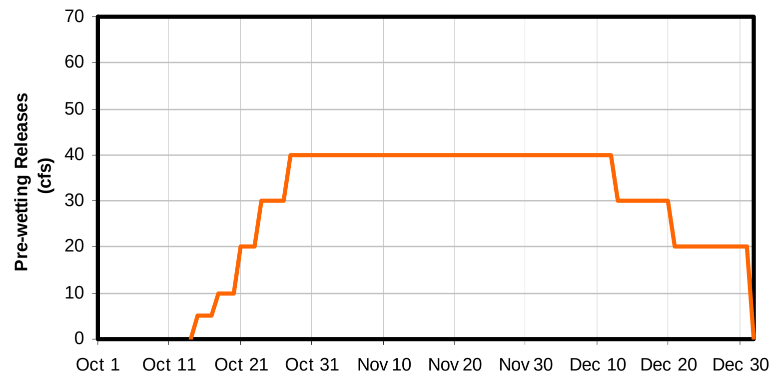

Figure 2. Cosumnes River channel pre-wetting releases from the Folsom South Canal.

2005 Operations and Conditions

The 2005 Demonstration Phase of the Project has presented several unique challenges. Implementation of the Demonstration Phase is possible because of available surplus water in the B2 Program resulting from a wetter than normal winter and spring. On the Cosumnes River, wet conditions sustained higher flows on the river throughout the summer (Figure 3). These higher flows kept the river channel wet to about river mile 13, near Wilton. Typically, summer flows will only maintain a wet channel to about river mile 32, just below the Highway 16 crossing.

At the start of the Demonstration Phase, October 17 2005, the Cosumnes River at the Folsom South Canal had a flow of 20 cfs (Figure 1). Because the river channel at the Folsom South Canal outfall was full of water, canal releases were not ramped up as shown in Figure 2; rather, the initial release was set at 40 cfs. The purpose of ramping up releases was to fill the in-channel pool at the canal outfall, which would dissipate the energy of full releases from the canal.

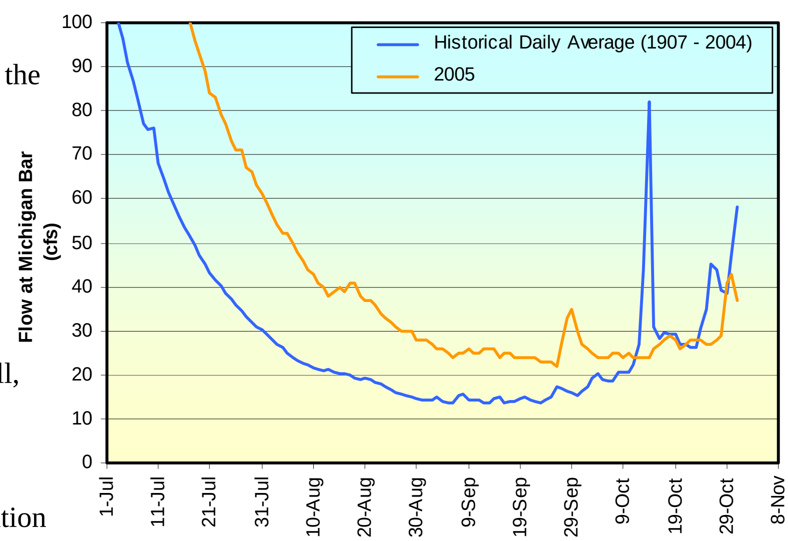

Figure 3. Historical daily average flow and 2005 flow at Michigan Bar.

Not surprisingly, the first weeks of operation revealed that the seepage losses in the channel were much lower than expected. Lower seepage losses meant that the river was very responsive to pre-wetting flows and the wetting front moved quickly downstream. Figure 4 shows the rate of release from the Folsom South Canal and the combined flow of the river and canal releases at Blodgett Dam, immediately downstream of the canal. Figure 5 shows the location of the wetting front resulting from the combination of canal releases and natural river flow. As Figure 5 shows, connection to tidewater occurred on two separate occasions. The first was a result of pre-wetting releases from the canal. During this occurrence a maximum of 8 cfs flowed into tidewater over a period of about 5 days. The second occurrence was the result of unpredicted precipitation in the upper watershed. This resulted in a maximum of 12 cfs entering tidewater for another 5 days. Neither occurrence attracted salmon into the river.

Erosion at the canal outfall was evaluated on October 21, after 4 days of 40 cfs releases into the river. Streambed surveys taken on the 21st were compared to surveys taken prior to the start of the Project. This comparison indicated that while some shifting of the sandy channel bottom has occurred, no significant scouring below the outfall or on the stream bank has occurred as a result of canal releases.

Because of the higher than normal natural river flow, only 740 ac-ft of the available 5,000 ac-ft has been released from the canal. In addition, as Figure 4 indicates, canal releases have been shut off since November 2. The current natural flow of about 40 cfs is maintaining a wetted channel to river mile 8, approximately 3.5 miles upstream of tidewater.

The current forecast for the Sacramento area is for dry and warm conditions through November 24. Under these conditions, the flows at Michigan Bar are expected to remain stable at just above 30 cfs and the wetting front is expected to maintain its position at about river mile 8.

If current weather and river conditions persist, additional pre-wetting releases will not be required. Additionally, continued dry conditions may jeopardize this year's entire salmon run on the Cosumnes River if no significant precipitation occurs until December.

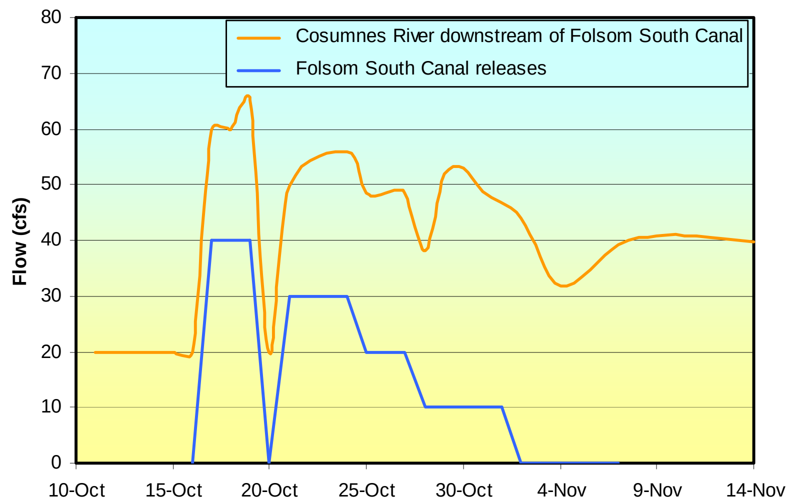

Figure 4. Folsom South Canal releases and flow in the Cosumnes River immediately downstream.

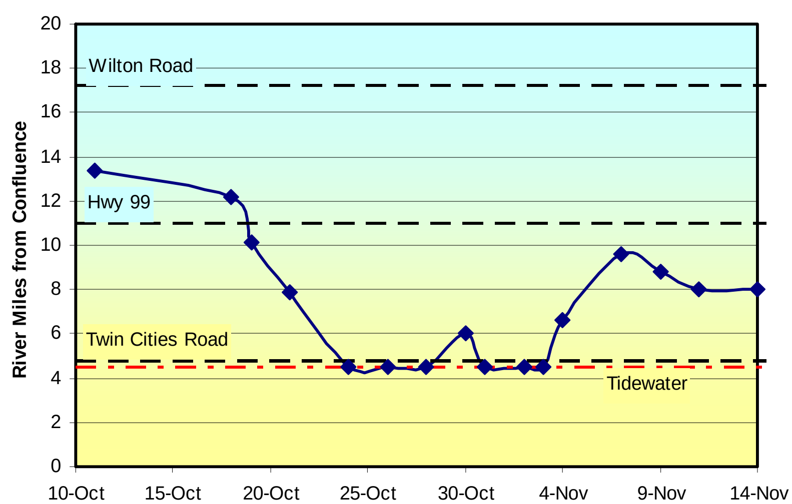

Figure 5. Location of wetting front on the Cosumnes River.

PROPOSED NEXT STEPS

Unique conditions on the Cosumnes River make it possible to consider changing the Project's operation to make canal releases that will provide attraction flows for salmon. The Project partners have determined that creating an attraction flow would be a reasonable use of available water and would offer a unique opportunity to assess numerous research questions regarding salmon behavior. This section details proposed Project operations for the remainder of 2005, provides justification for these operations, and identifies the research questions that will be addressed based on proposed operational changes.

Proposed Operational Changes

The proposed change to the original operations plan, summarized above, would entail making canal releases sufficient to augment natural flows to create a total river flow adequate to attract salmon into the Cosumnes River. Observations from this year's operations and historical hydrology suggest that a total flow of approximately 100 cfs immediately downstream of the Folsom South Canal for a period of 7 days would be sufficient to provide a freshwater pulse through the tidal portion of the lower Cosumnes River (river mile 4.5 to 0) and into the Mokelumne River. Based on observations from previous years, such a pulse should attract salmon into the Cosumnes River.

After completion of the pulse flow, Project operations will shift to maintaining viable upstream passage conditions from tidewater to the Folsom South Canal, according to the original operations plan. A total flow of approximately 70 cfs immediately below the canal is required to maintain upstream migration conditions for salmon. According to the original operation plan, release will be made from the Folsom South Canal to meet the required flow.

Figure 6 shows the proposed pulse and augmentation flow releases needed to maintain passage under the worse case scenario that natural river flows remain near 33 cfs through December 31. Under this scenario, the Project would release an additional 3,910 ac-ft of the remaining 4,260 ac-ft available to the Project.

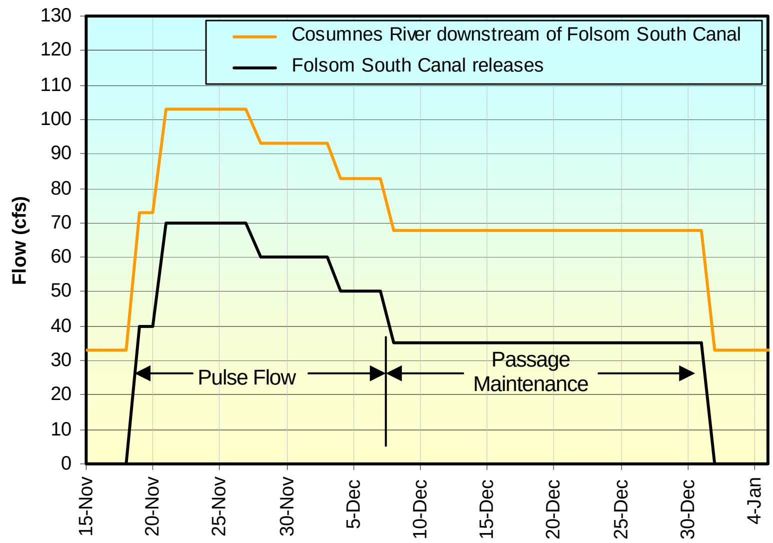

Figure 6. Proposed Folsom South Canal releases.

Justification for Operational Changes

River Conditions – Several conditions exist that justify the proposed changes to the original operations plan. Foremost of these is the natural flow condition of the Cosumnes River. As shown in Figure 3, flows have been much higher than normal this year. These higher flows have created acceptable salmon spawning conditions in the main spawning reach (river mile 27.5 to 51) of the river, as verified by Fisheries Foundation of California (FFC) biologists during several field surveys conducted since the

November 1. FFC monitoring indicates that water temperatures at the bottom of the spawning reach (river mile 17.5) are ranging from 55°C to 59°C. The current availability of spawning habitat provides spawning opportunities similar to conditions experienced in 2002, when the Cosumnes experienced a run of over 1,300 salmon. In 2002, the river experienced 4 days of high flows in early November, peaking at nearly 300 cfs, after which flows receded to 34-38 cfs until early December.

In most years, fall river conditions, in the absence of significant precipitation, would not provide suitable conditions for salmon spawning. Therefore, the original project objectives included language that specifically precluded creating attraction flows which would draw salmon into inhospitable conditions. As described in this document, conditions in the river are not typical and as such warrant consideration of alternative operations that would overcome the lack of precipitation and take advantage of acceptable spawning conditions that currently exist in the upper river.

> "…conditions in the river… warrant consideration of alternative operations that would overcome the lack of precipitation and take advantage of acceptable spawning conditions."

Water Availability – With the dedication of 5,000 ac-ft of B2 water to the Demonstration Phase of the Project there is ample water supply to make the pulse flow release and to sustain upstream migration conditions through December 31. To date the project has only utilized 740 ac-ft of the available supply. The proposed pulse flow operation will require 2,240 ac-ft. Augmentation releases to maintain upstream migration will require 1,670 ac-ft, in the worse case scenario that no precipitation occurs before December 31. With the proposed operational changes, an additional 3,910 ac-ft is needed to complete the Demonstration Phase, bringing the total projected water need to 4,650 ac-ft.

> "With the proposed operational changes, an additional 3,910 ac-ft is needed to complete the Demonstration Phase, bringing the total projected water need to 4,650 ac-ft "

Rescuing the 2005 Cosumnes River Salmon Run – While it has been eluded to extensively in this document, the primary justification for using canal releases to create an attraction flow is to simply rescue the 2005 fall chinook salmon run on the Cosumnes River. River conditions and the availability of water have converged to present the fisheries and water management interests on the Cosumnes River with an opportunity to rescue this year's salmon run, which has suffered significant declines due to groundwater pumping and habitat degradation.

> "…the primary justification for using canal releases to create an attraction flow is to simply rescue the 2005 fall chinook salmon run on the Cosumnes River. "

Research Questions and Assessment Approaches

The implementation of proposed operational changes will allow the FFC, The Nature Conservancy (TNC), UC Davis, and the Southeast Sacramento County Agricultural Water Authority (SSCAWA) to assess the following list of research questions. The FFC, TNC, and SSCAWA will collect much of the data required to perform these assessments through existing monitoring program.

1. Will release of American River via the Folsom South Canal (FSC) result in immediate immigration of fall-run chinook salmon presumably holding in the tidal reach of the lower Cosumnes River?
   a. Examine the confluence pool prior to connection for the presence of holding fish;

   b. Monitor the number of fish moving upstream immediately following connection (e.g., at the box culvert).

2. Will artificially creating passage by releasing water from the FSC increase attraction of non-natal fall-run chinook salmon?
   a. Conduct carcass surveys of the Cosumnes River;
   b. Examine carcasses for adipose fin clips (indicating the presence of a coded wire tag) to determine the hatchery origin of marked fall-run chinook salmon in the Cosumnes River;
   c. Determine the origin of coded wire tags to obtain abundance of fish from other systems (e.g., American River, Mokelumne River, Merced River);
   d. Compare numbers of fish derived from other systems this year with numbers from previous years;
   e. Determine the proportion of any fish derived from the American River that spawned in the lower reach of the Cosumnes River where flows are influenced/dominated by releases from the FSC.

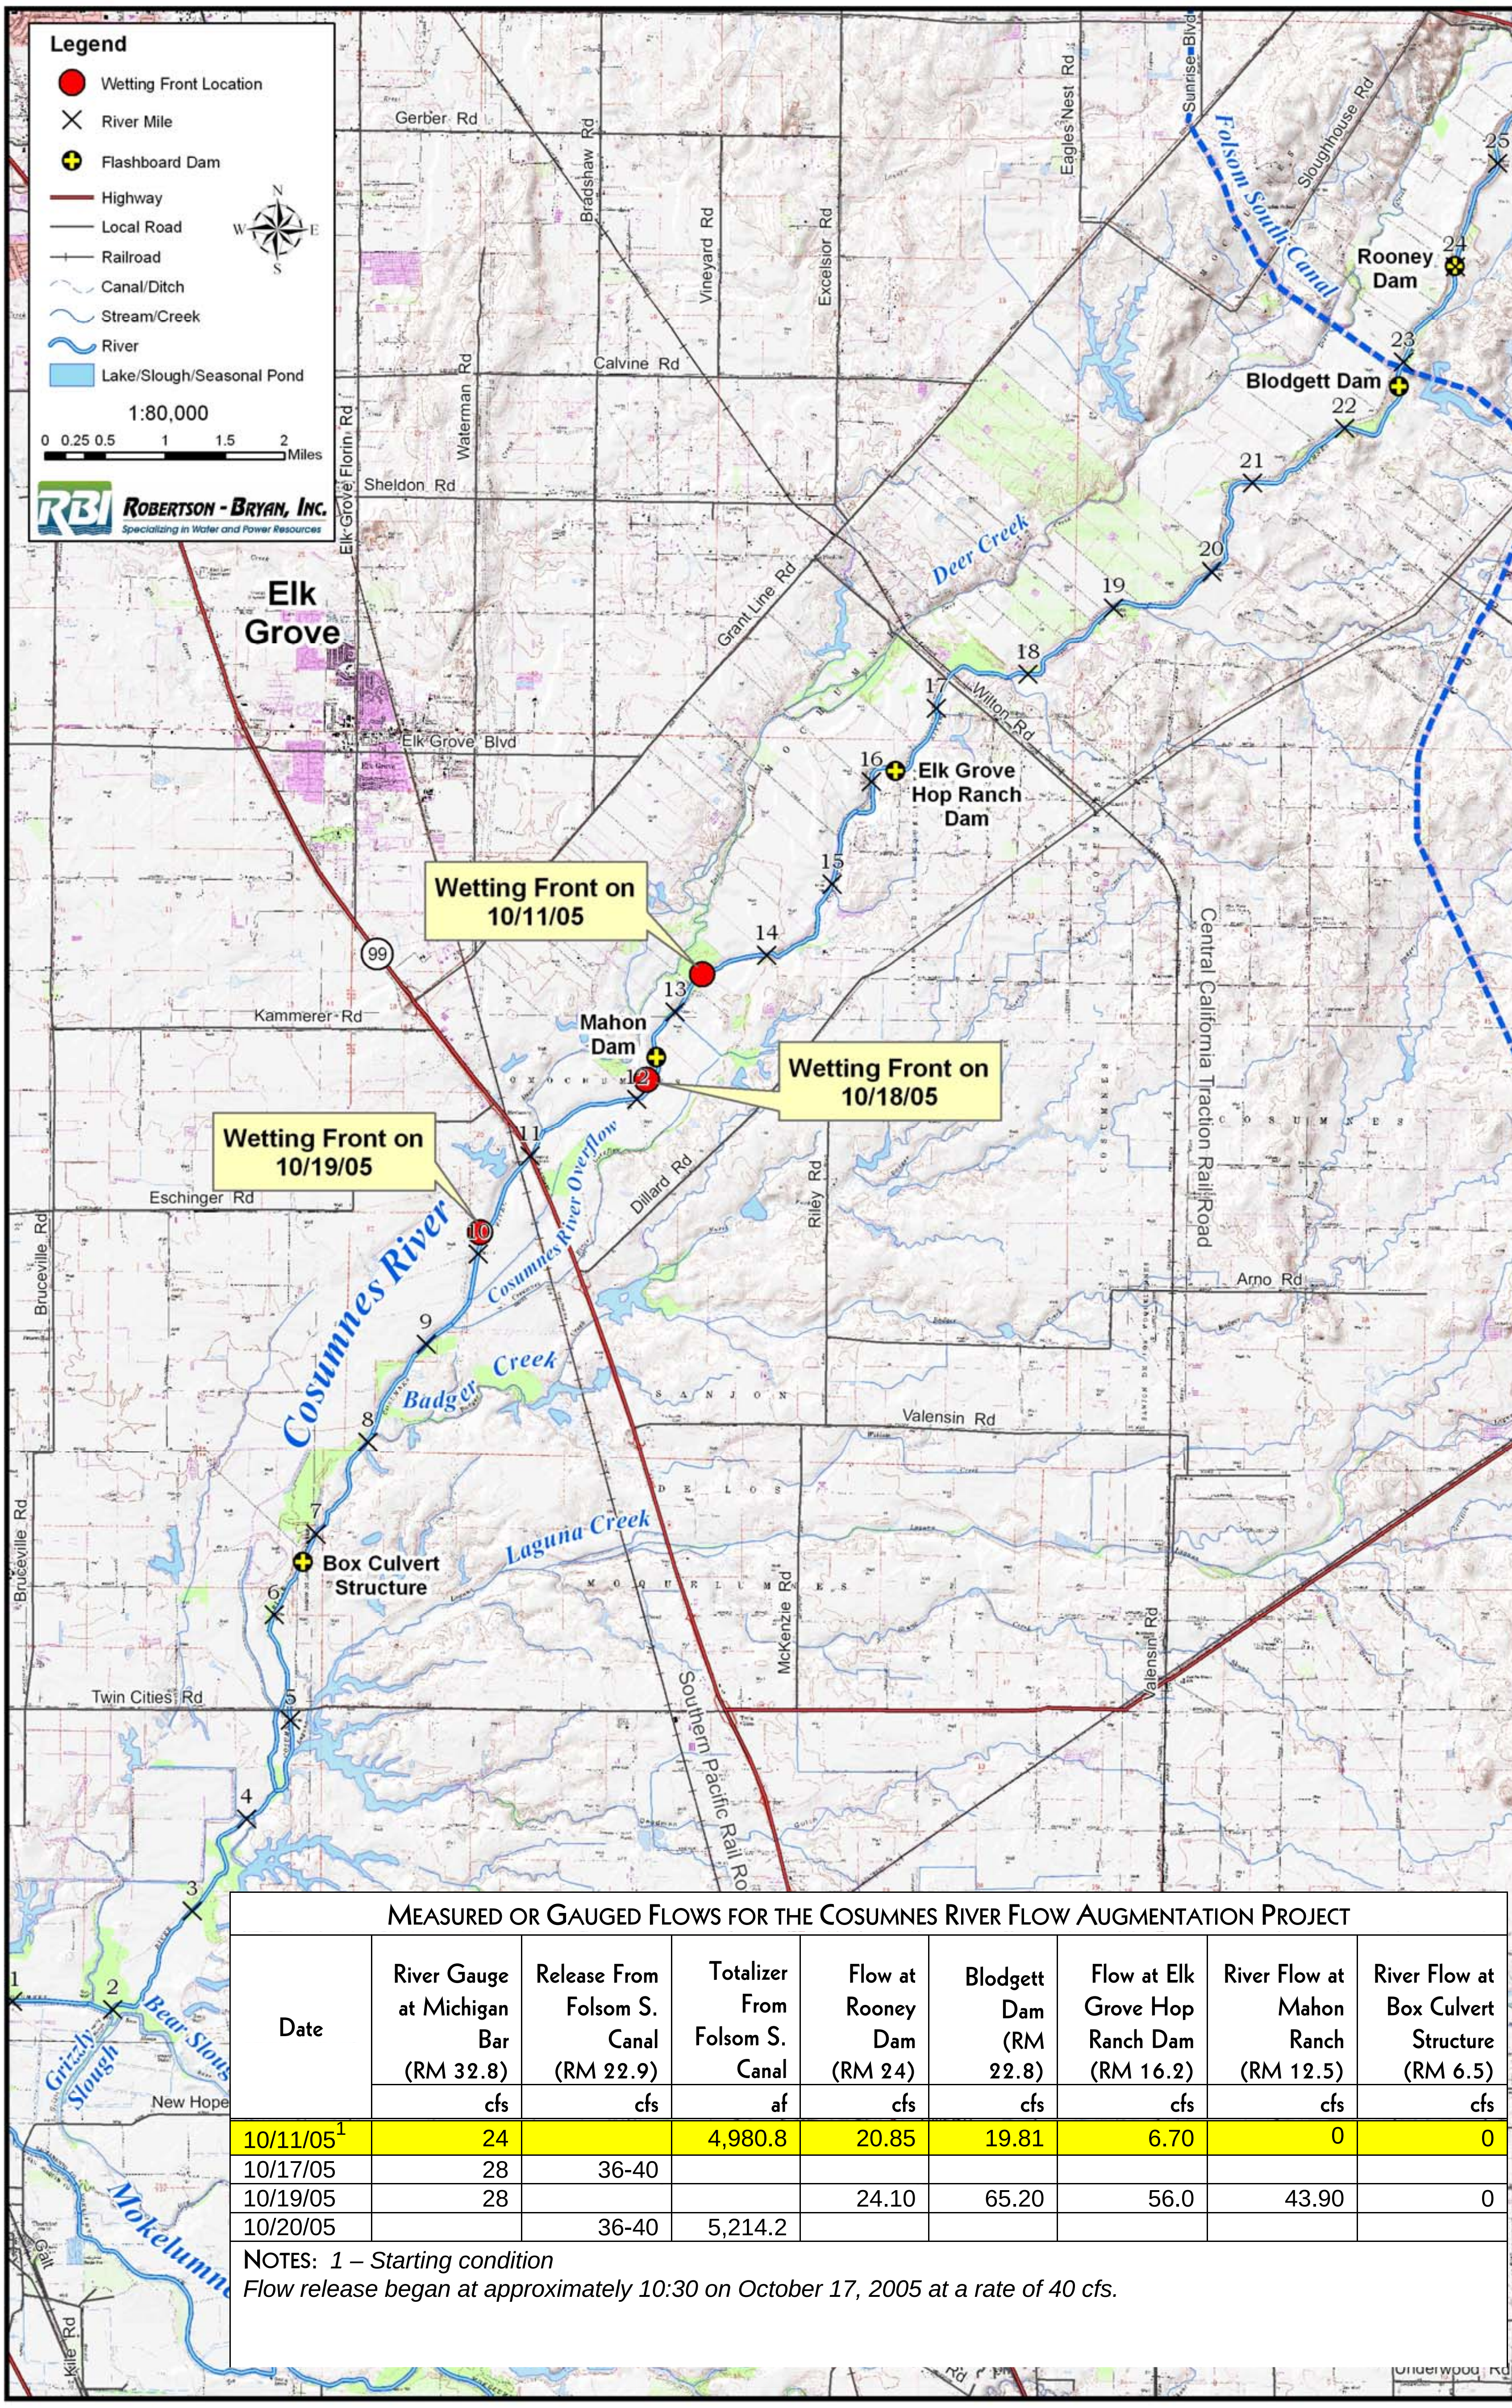
3. Will artificially creating passage affect pre-spawning mortality relative to past years?
   a. Determine the relative numbers of spawned-out carcasses and non-spawned carcasses;
   b. Calculate the proportion of each;
   c. Compare the proportions of each to previous years.

4. At what water temperature does chinook salmon spawning activity begin? Peak?
   a. Monitor spawning activity throughout historic spawning reaches of the Cosumnes River;
   b. Monitor water temperatures at several locations using Onset StowAway loggers; deploy additional units at the following locations: 1) in the FSC and 2) at Blodgett Dam;
   c. Characterize the relationship between water temperature and the onset and peak of spawning activity.

5. Will release of American River water affect the spawning distributions of fall-run chinook salmon within the Cosumnes River?
   a. Determine the relative numbers of fish spawning upstream and downstream of the FSC;
   b. Compare upstream/downstream spawning distributions to historic data.

6. Will release of water from the FSC turnout delay or disrupt migrating fishes, causing them to congregate at the outfall?
   a. Examine the outfall of the FSC for the presence of milling fish and/or fish trying to jump into the outfall;
   b. Survey the Cosumnes River upstream of the FSC for potential migration barriers.

Monitoring Reports



MEASURED OR GAUGED FLOWS FOR THE COSUMNES RIVER FLOW AUGMENTATION PROJECT

Date	River Gauge at Michigan Bar (RM 32.8)	Release From Folsom S. Canal (RM 22.9)	Totalizer From Folsom S. Canal	Flow at Rooney Dam (RM 24)	Blodgett Dam (RM 22.8)	Flow at Elk Grove Hop Ranch Dam (RM 16.2)	River Flow at Mahon Ranch (RM 12.5)	River Flow at Box Culvert Structure (RM 6.5)

Subject: NEPA info

Here is the information I referenced regarding Categorical Exclusions (CE). The problem with this approach is that the proposed action has to qualify under one of our previously approved catagories. We have developed a variety of CEs for normal planning activities, research/data collection but only for non-manipulative studies, minor consruction, O&M, etc, but none of them really apply to pre-wetting. The next step we can try is the mini-EA if we can demonstrate that all the criteria on the attached checklist are possible, but there is no CE that applies.

This is a farily abbreviated process, but will take some time to write, review and finalize. There will also be ESA to complete. I assume that we could get by with an informal consultation with a finding of not likely to adversely effect. This requires concurrance from the Services before we can take the action. They can require up to 30 working days to review and issue their concurrance letter. Finally, I think you are aware that the project proponent will be responsible for preparing the environmental documents. All the agency folks plates are already full, particularlly with the end of our fiscal year comming up.

Hope this helps....we can visit again next week.

Subject: RE: NEPA info

First, let me give you my understanding of where we are in the process right now. I think the fish agencies are basically ok with the proposal, but with some qualifiers. The first is that the Service is willing to dedicate some supply so long as it is banked b2. The behind the scenes issue is that we have never had the potential for having water in the bank, nor have we sorted through how we would implement banking. There continues to be discussion between Reclamation and the Service directed towards the issues. It is also my understanding that DFG had some lingering concerns over trans-basin movement of water. I have only secondhand knowledge of this concern, but it seems that the one way to deal with it would be in an analysis suitable for inclusion in an environmental document.

Regarding the environmental documentation hoops, Reclamation does not have a CE that applies to the proposed action. I am not aware of what the Service may have in place, or what they perceive to be their need for environmental documentation. CEs are generally for administrative types of actions or for routine ongoing operations where there has been a history demonstrating no impacts. In the case of this action, it seems clear that there are some potentially significant environmental issues that would need addressed. That bumps us into the EA realm. It is possible, although challenging, for you to complete an EA by the time you expect to start the action. It also presumes that there are no unresolved controversies or impacts that can not be mitigated though agreed to modifications to the project description. A common problem early in process like yours is that the project description is not of sufficient detail to fully describe and analyze the effects, nor does it articulate the measures needed to avoid all the potential impacts. Related to this is that the EA needs to meet the needs of the agenciesthat would use it and be consistent with the Federal authorities used to take the action. Assuming you are successful in getting a commitment of b2 water, then the purpose and need and project description in the EA would need to emphasize the fisheries aspects of the action given our reliance on 3406 (b)(2) as our authority to take the action.

Another key aspect is the potential for effects to listed species. We will need to comply with the section 7 of the ESA consultation requirements irrespective of the level of NEPA required. Key to having the section 7 go quickly will be an ability to make a determination of "no effect." This is for all species, not just the aquatic, and will depend on the reach of potential impacts (direct, indirect, and cumulative). If there are effects that are positive, are small, or the are completely discountable, we would still have to make a finding of "not likely to adversely effect" which requires concurrence from both of the Services. The Services generally require at least 30 days to complete their analyses and issue a concurrence letter. One way or another, a definitive analyses of effects to all potential listed species is needed.

I do not know how far you are in your processes or to what extent you have documentation and analyses available, but you can see that there is a lot of additional process needed before we could take any kind of action. I also do not know if there is a CEQA obligation for the water district that would also be needed to deliver the water from the Folsom South Canal to the river.

Regarding your section 215 water question, this term came to be used after section 215 of Reclamation Reform Act of October 12, 1982 (Public Law 97-293) defined temporary supplies of water as: "(1) an unusually large water supply not otherwise storable for project purposes; or (2) infrequent and otherwise unmanaged flood flows of short duration." The term excess water is often used to describe situations where there is more water in the system needed to meet all environmental, regulatory, and water user downstream demands. The two do not always match.

I hope this helps give you a better picture of what I see as the remaining challenges to using b2 water for your proposed project. I recognize that having a firm supply would help justify committing to the effort needed to button up the environmental documentation, but regardless of source, you will need to help Reclamation jump through all the above hoops before we would authorize use of our facilities. My personal opinion is that you have a better than 50/50 chance of there being b2 water to use, but it will take a focused effort to complete the environmental due diligence in the time remaining. Give me a call if you want to discuss the issues further.

Subject: Cosumnes Project a go

We are go for a 10 am start next Monday with the following proviso.....check you e-mail first thing Monday am. A discussion with State Board personnel is scheduled for this afternoon. It is expected to be information sharing and there are not expected to be any showstopper issues. However, if something unexpected comes up, I will notify all by e-mail this weekend, and follow-up with a phone call by 8 am Monday morning.

The Project Proponents have also canceled their plan to have media present during the initial release. Additional plans will follow. Thanks to all for your patience and support in making this happen. I'll be following up with some of you on your specific questions, but meatime, let me know if you have any questions.......

Subject: Thanks

To all:

Today was one of those days in applied research that makes the effort worthwhile. About 9 years ago, Rich Reiner, then the project ecologist on the Cosumnes River Preserve, came to UC Davis to ask if a partnership could be developed to look at the causes and the cures for the decline of fall flows and salmon on the Cosumnes River. Graham Fogg and his students, Jan Fleckenstein and Rich Niswonger, along with Michael Anderson from engineering, took on the task of describing the complex interaction between surface water and groundwater in the Cosumnes and prescribing what flows might be necessary to restore flows for fall run chinook salmon while not hurting groundwater resources. Wendy Trowbridge, Carson Jeffres and others helped with the calibration work for this effort. Keith Whitener had done a lot of the preliminary work, along with Trevor Ford and others, to show that salmon escapement roughly coincided with declines in fall flow conditions, thus building the case for restoring fall flows. Mike Eaton, with the help of Larry Rodriguez, Anthony Saracino and others did the heavy political lifting with the locals and the Bureau of Reclamation. So many more to mention, with apologies to all who are left out.

The bottom line, as picture 1 and 2 show, the Bureau released B2 Environmental Water into the Cosumnes at around 10:00 a.m. this morning. 40 cfs added to the low flows of the Cosumnes will help reduce infiltration capacities, possibly charge perched, local aquifers, and wet up the bed before the first rains fall on the watershed, hopefully opening up the river to chinook salmon.

This triumph of persistence and will is owed to many people. Specifically Mike, Larry, Graham, Jan, Rich N., Rich R., Keith, Carson, Wendy, and a bunch of others. It is a unique experiment: unprecedented in California and beyond. Thanks to everyone who worked on this. What seemed so simple at the start was tough, but worth it to do. Please forward to those I have left out. Again, thanks to all. What a treat.

Jeff

Subject: good start

I'm glad all went well yesterday. I do have to bring up that the volume of press present was surprising and unexpected. Please convey to the other project proponents that any other outreach that involves access to Reclamation facilities or representations of the facts involving our role/involvement must be coordinated with me/us first. (especially if Leo is going to be taking the credit for "negotiating the deal").

The starting reading on the totalizer was 498080.8

Please have your monitoring crews regularly record the time, date, and reading on the totalizer as part of their routine monitoring. The gauge is located on the bottom of the flow meter which is in the vault adjacent to the waste way valve. The locks on the vault and gate providing access to the river are now the same as the main gate key. Be sure your crews lock the vault/gate when not in use.

When you come up for air, we can discuss a more comprehensive tour for the fish agency folks. We look forward to your first progress update.

Subject: REQUEST FOR CHANGE IN FSC RELEASES

Gentlemen,

After reviewing the progression of the wetting front on the Cosumnes River, we are anticipating the need to change the rate of release from the Folsom South Canal to the Cosumnes River.

The exact change will be dependant on Reclamation's schedule. Please let us know the date and time that you will be available and RBI will provide you with the target release rate. Our desire is to have this change made at your soonest convenience, but by Tuesday Oct 25 at the latest.

As all project materials indicate, releases to the Cosumnes River will be adaptively managed based antecedent conditions, progression of the wetting front, and rates of channel losses. Not all of these factors are known at this time, hence the demonstration project. Therefore, Reclamation may be called upon to effect changes to the release on a frequent basis, and in some cases with short notice. Please understand that this is the nature of this project.

Please respond to this email with Reclamation's schedule meeting this request.

Order recieved. Will implement asap and expect that it will be done by around 8 am today.

You guys have let the one thing the Fish Agency folks were most concerned about happen.
I spoke with Nick Hindmen this morning, He does not feel that this a big deal. We are adaptively managing flows to maximize extent of wetted channel, without intentionally creating a connection that would support upstream migration. I informed him that we were cutting back flows to eliminate any possible opportunity for upstream migration. He was comfortable with that. He understood that the reason for the pilot project is help determine how the system will respond, that every year is expected to be different, and that the primary purpose is to refine project operations based on expected system responses and varying annual conditions. That is what we are now doing.

Have any fish gotten up in the system?
Survey crews have not seen any evidence of upstream migration. We also don't believe that rate of flow entering tide water (>8 cfs) is enough to create attraction.

How long befor a cut is manifested at the mouth?
Based on our observations over the past several days, it appears the change in release made this morning will manifest itself at Twin Cities Road by tomorrow morning. This response time is much quicker then all previous studies have indicated. This is probably due to several factors. First, a portion of the channel was already flowing and is not experiencing the magnitude of loss (seepage) that would normally be expected. And second, the portion of the channel that was dry is not experiencing expected loss rates.

What do you expect 20 cfs to result in and why?
We expect that a 10 cfs reduction in flow will eliminate any connect to tide water. Specifically, we don't "expect" to see flow passing Twin Cities Road. This is based on

our observation of 10 cfs at the box culvert, consequently a 10 cfs reduction should almost eliminate flow at that point (several miles above Twin Cities Road).

What are you plans now?,disconnect, maintain connection at a low flow, something else??
We are sticking to our original plan to not maintain a connection that allows for upstream migration prior to a "natural" conenction. That's why we asked for a reduction in the canal release. We will monitor current conditions and request changes as needed. Once rainfall generates sufficient natural flow we will request that releases be shut off. If after that point, natural flows do not maintain connection we will request additional releases to maintain connection. All of this is according to our original project plan.

Are you soliciting input from the fish agencies?
I have spoken with FWS.

I'm in meetings this morning,but expect that I will have another 8 messages from the fish guys/management when I return asking me what your plans are.
Please feel free to forward all 8 emails to me and I will respond appropriately.

Subject: Cosumnes Project new Coverage

Sylvia,

I am trying to run down all of the media coverage for the Cosumnes River Flow Augmentation Project. So far I have found the Sac Bee Article, Sac Bee Editorial, the Davis Enterprise article, and I know there was a KVIE/UCD spot. Can you give me more info on the KVIE/UCD spot and any other media coverage that I don't know about. I am compiling a summary of media coverage for the SSCAWA and others.

Also, I would like to get a copy of photos that were taken that day, if you can make them available.

Hope all is well and thanks for getting all the great coverage of this project.

Subject: New Release Procedures for Cosumnes River

All,

After evaluating the Cosumnes River's responses to flow releases, the background flow of the river, and projected weather conditions, we would like to request the following changes in operating procedures.

Our original project design was based on having a constant controllable flow from the canal, which translated to a constant controllable flow in the Cosumnes River just below the canal. This was based on the fact that there is typically no background flow in the river and all river flows would be derived from canal releases. Under this condition, changes to canal release would be expected to be minimal.

This year presents a quite different situation. Background flows in the river have made predicting the river's response a bit more challenging. However, based on our observations the best approach for creating a stable flow at Blodgett Dam, immediately downstream of the canal, will be to make more frequent adjustments to canal releases based on flows measured at Blodgett.

Therefore, we would like to implement the following procedure:

- Field crews measure flows at Blodgett Dam every Monday, Wednesday and Friday morning before 10:00 am. The measured flow value will be transmitted to RBI before 10:30 am. RBI will determine what, if any change needs to be made to canal releases.
- Reclamation be available to make adjustments to canal releases every Monday, Wednesday, and Friday after 12:00 pm. RBI will contact Reclamation with required release changes prior by 11:00 pm.
- Implement this procedure beginning Friday, November 11.

The objective is to maintain a flow at Blodgett of 40 cfs, which we estimate will push water to about the Box Culvert. In some cases, there will be no need to change releases from the canal, in other cases there may be a need to change the release by only a few cfs to 10s of cfs. The 40 cfs target will be maintained until natural flows connect the river to tidewater. Given the dry weather pattern ahead of us, that will be weeks away.

After we get a "natural" connection, we will reevaluate our target flow at Blodgett, with the goal of maintaining a barrier free migration corridor. The amount of canal release will depend on natural flow conditions.

I intentionally did not send this out to the larger ops email group, because I wanted to make sure that we could work out the kinks of implementing this procedure before we go too "public". However, we welcome input from all interested parties and other Reclamation or agency reps not included in this email.

Thank you,

Larry J. Rodriguez

Subject: Cosumnes Flow Releases

Folks,

I've discussed this with some of you and some of you have brought this up independently.

If dry conditions continue in the Cosumnes River watershed, do we want to release water from the canal to force a connection to tidewater and attract salmon into the river?

This type of action is not part of the typical operations plan, because we surmised that if natural flows were not sufficient to create a connection then the flows in the river would be really low and conditions for salmon would be unacceptable. However, this year is not typical. We have had flow in an extended portion of the river all summer. Meaning, conditions for salmon spawning may be acceptable. I defer to Trevor, in particular, to determine whether this is the case.

It would seem like a reasonable use of this year's water to create an attraction flow for salmon, rather then risking a zero run year. However, the water is being provided from Reclamation and the B2 Program. Therefore, I am not in a position to ask Reclamation to make this adjustment to the operations plan. I believe that the request should come from FWS and AFRP. I am willing to help in whatever manner I can.

We have only used 740 ac-ft of the available 5,000 ac-ft. Currently there are no releases being made from the canal and the flow past the canal is just less than 40 cfs. The wetting front is located about 1.5 miles downstream of Hwy 99. The seven day forecast (NOAA) calls for temps in the 70s and no precipitation.

Please let me know how you would like to proceed.

Subject: Cosumnes Flow Release Strategy - Conference call

All,

To coordinate our request to change the Cosumnes River Flow Augmentation Project, I am requesting a **conference call for this Thursday at 9:00 am.**
Please let me know your availability to participate.

As you all know, we are considering changing the operation of the flow augmentation project from a "pre-wetting" program to a "salmon attraction" program. This change is contemplated because of the sustained dry weather pattern we are experiencing (which is jeopardizing this year's salmon run), our availability of water for this proposed use, the favorable ambient condition of the main spawning reach of the river, and to broaden our experimental design to address additional questions regarding salmon behavior on the Cosumnes River.

The B2 Water Program management group will be discussing this issue at their regular Thursday meeting. I am anticipating that USFWS and Reclamation will want to discuss this request with us after that meeting, potentially as early as this Thursday afternoon or Friday. To ensure that "our side" is on the same page, I am requesting the above conference call. To facilitate our coordination RBI, with assistance from Trevor Kennedy, is preparing a brief memo addressing the following issues:

- Original project operations
- Reasons for changing operations
- Hypotheses that will to evaluated through this new "experiment."

Our experience tell us that USFWS will want to know what benefit will be derived from this program and use of the B2 water. A clear and coordinated response to that question will strengthen our case and, more importantly, will facilitate a quick response. Ideally, we would like to begin attraction release before Thanksgiving.

Please provide a response regarding your availability for the conference call or if you have any other questions.

Subject: REQUEST FOR CHANGE IN FSC RELEASES

Gentlemen,

We would like to request that releases from Folsom South Canal to the Cosumnes River be reinitiated at a rate of 5-8 cfs, closer to 8 cfs if possible. We will be trying to maintain 40 cfs just below the canal, within the infrastructure capabilities.

Our goal is to try to move the wetting front a few more miles downstream. The front has been creeping back upstream as a results of slightly declining flows at Michigan Bar (currently at 30 cfs) and dry conditions in the lower river channel. This supplemental release should move the wetting front back to about 2 mile upstream of tidewater.

Subject: Re: Fw: Cosumnes Flow Release Strategy - Conference call

Tom,

I think it is important for everyone to understand that the b2 releases were never meant to serve as supplemental surface flows. The intent of the "COSUMNES RIVER FLOW AUGMENTATION PROJECT 2005 PILOT PROJECT OPERATION PLAN" was to use water from the Folsom South Canal to pre-wet the channel bed so that when natural rain-fall occurred the connection to the spawning reaches would occur sooner. There was never any agreement that we would use this water for supplemental surface flow. In fact it was my understanding that b2 managers explicitly stated that the water was not to be used for supplementing surface flow. This decision, however, does not affect the originally stated purpose of the Pilot Study and that is to pre-wet the channel bed and hope for rain.

Subject: Cosumnes River Project for next year.

Nick & Dave,

The flow augmentation program is coming to a close and I think that we can call this a successful experiment. When we finally received enough precipitation to increase the natural river flow the river was able to establish a connection to tidewater at about 50-55 cfs (measured at Michigan Bar). This connection was strong enough that we also saw fish moving into the river. Compare this to our original estimate of needing a minimum of 110 cfs flow spike or more than 65 cfs for a sustained period (+7 days) to create connection.

Given the wet conditions in the river, prior to the start of the project, we have released less than 1,000 af into the river. Looking forward to next, I am unsure whether our permanent water supply from the County will be available by next October. Therefore, I would like to start the ball rolling on trying to secure water from the B2 Program next year. The simplest approach might be to allow us to retain the unused portion of water, slightly more then 4,000 af, for next year.

I have sent this email to just you two, to seek some input on the best approach to making this request.

Larry and Dave,

I agree that this year's pilot project on the Cosumnes was worthwhile and I hope it proves to be successful. That said, the B2IT group was very clear that this was a one-time pilot effort using 5 TAF of banked b2 water. In all likelyhood the remaining 4 TAF of banked water earmarked for the Cosumnes study will spill if/when Folsom goes into flood control releases.

You're welcome to pitch the idea of another Cosumnes effort in 2006 to B2IT, but I wouldn't be too optimistic.

Nick responded as I expected, hoever, you might try a couple of strategies. First try and get the project daylígheted in some of the annual science conferences/reviews. I know that when the EWA Science Review Panel looked at past EWA actions, the one they thought was one of the more beneficial actions taken was bypassing power production at Folsom to provide cold water. To the extent you can get independent reviewers to laud the merits of the project, the easier it would be to get the Service to dedicate some water in the future. Meantime, we should have some conversations about how we would account for the Aerojet water and what it will take to utilize that supply for your purposes. I know that ball is really in the County's court, but the sooner we get a group on the same page, the sooner you might have a more reliable supply. It is going to require quite a bit of analysis and discussion to come up with a proposal for use that Reclamation can live with.

Subject: RE: Cosumnes River Project for next year.

Thanks for you input Dave.

I put some thouhght into our approach with FWS with others.

As for the long-term supply I am trying to get the county to re-work their management strategy to avoid an excahnge agreement. They will be supplying more then 40 cfs to the American River on a daily basis, so if we can manage that with all the other user, then we can simply divert wants needed on the Cosumnes (Oct-Dec) and in the remainder of the year the other users can take all the Aeroject discharge. I think that are coming round to the idea. I'll try to get something set up to explore this option from all sides.

Have a Merry Christmas and Best in the New Year.

MANAGING SURFACE WATER-GROUNDWATER TO RESTORE FALL FLOWS IN THE COSUMNES RIVER

Title	Managing Surface Water-Groundwater to Restore Fall Flows in the Cosumnes River
Publication Type	Journal Article
Year of Publication	2004
Authors	Fleckenstein J, Anderson M, Fogg G, Mount JF
Journal	ASCE Journal of Water Resources Planning and Management
Volume	130
Issue	4
Date Published	06/04
ISSN	0733-9496/2004/4-301-310
Abstract	Declining fall flows are limiting the ability of the Cosumnes River to support large fall runs of Chinook salmon. Management scenarios linking surface water and groundwater alternatives to provide sufficient fall flows are examined using groundwater flow and channel routing models. Results show that groundwater overdraft in the basin has converted the river to a predominantly losing stream, practically eliminating base flows. Management alternatives to increase net recharge (for example, pumping reductions) were examined along with surface water augmentation options. Using a minimum depth standard for fish passage, average surface water flow deficits were computed for the migration period of Chinook salmon. Groundwater deficits were evaluated by comparing simulated current groundwater conditions with conditions under various scenarios. Increases in net recharge on the order of 200 to 300 million m3/year would be required to reconnect the regional aquifer with the channel and in turn reestablish perennial base flows. Options that combine surface water augmentation with groundwater management are most likely to ensure sufficient river flows in the short term and to support long-term restoration of regional groundwater levels.

April 30, 2014

Report to the Governor's Drought Task Force – Groundwater Basins with Potential Water Shortages and Gaps in Groundwater Monitoring

The Department of Water Resources (DWR) prepared the attached groundwater report as required by Governor's January 17, 2014 Emergency Drought Proclamation (Order Action Number 11). The proclamation required that DWR describe basins with potential water shortages and gaps in groundwater monitoring. Preparing the report entailed compiling and evaluating all available data, including information presented in California Water Plan Update 2013.

A follow-up groundwater report will be provided by November 30, 2014, as required by Governor's April 25, 2014 Executive Order (Order Action Number 11) that addresses areas where the drought has significant impacts to groundwater resources. DWR will conduct intensive outreach, provide technical assistance to local agencies in order to increase groundwater monitoring, and collect and analyze groundwater data. The focus of this report will be to identify groundwater basins with water shortages, gaps in groundwater monitoring, and provide the latest information on land subsidence and agricultural land fallowing.

Groundwater is a key priority for the Governor. The January 2014 California Water Action Plan developed by the Natural Resources Agency, California Environmental Protection Agency, and Department of Food and Agriculture identifies the critical need to improve groundwater management in the State. The Governor's 2014-15 budget proposes $618.7 million for funding actions in the Water Action Plan, including measures for drought response and to support improved groundwater management. The Water Action Plan expresses the Governor's commitment to work with local governments and agencies, Native American tribes, and the Legislature to identify and provide additional tools, resources, guidance, and the authority local managers need to sustainably manage groundwater resources. Recognizing that the State should protect groundwater basins that are at risk of permanent damage when a local agency is unable or unwilling to do so, the Governor's proposed budget provides resources to the State Water Resources Control Board to act as a backstop until an adequate local groundwater management plan is put in place.

In the next few months, DWR will continue to collaborate with the Governor's Office and other State agencies to develop the framework for a statewide sustainable groundwater management program, and DWR will take a lead role in implementing the program to fulfill the Governor's vision.

Executive Summary

Year 2013 closed as the driest in recorded history for many areas of California. On January 17, 2014, Governor Brown signed a Proclamation of a State of Emergency in response to the drought. This Public Update addresses Order #11 of the Governor's Proclamation and provides information regarding groundwater basins with potential water shortages and gaps in groundwater monitoring.

Groundwater is a vital resource in California providing close to 60 percent of the state's water supply in a dry year. Drought conditions typically result in an increase of groundwater well activity and pumping to compensate for water supply shortages. Increased groundwater pumping can lead to adverse conditions including dry wells, subsidence, decreased water quality, saline intrusion, and stream depletion. Evaluation of available data produced the following:

- Groundwater levels have decreased in nearly all areas of the state since spring 2013, and more notably since spring 2010.
- Since spring 2008, groundwater levels have experienced all-time historical lows (for period of record) in most areas of the state and especially in the northern portion of the San Francisco Bay Hydrologic Region, the southern San Joaquin Valley, and also for the South Lahontan and South Coast hydrologic regions.
- In many areas of the San Joaquin Valley, recent groundwater levels are more than 100 feet below previous historical lows.
- The greatest concentration of recently deepened wells is in the fractured bedrock foothill areas of Nevada, Placer, and El Dorado counties.
- The Kaweah and Kings subbasins have the greatest numbers of deepened wells in an alluvial groundwater basin.
- Thirty-six alluvial groundwater basins that have a high degree of groundwater use and reliance may possess greater potential to incur water shortages as a result of drought. The basins exist in the North Coast, Central Coast, Sacramento River, Tulare Lake, and South Coast hydrologic regions.
- Of California's 515 alluvial groundwater basins, 169 are fully or partially monitored under the California Statewide Groundwater Elevation Monitoring (CASGEM) Program.
- Forty of the 126 High and Medium priority basins are not monitored under CASGEM. There are significant CASGEM groundwater monitoring data gaps in the Sacramento, San Joaquin River, Tulare Lake, Central Coast, and South Lahontan hydrologic regions.
- Although there are 4,122 CASGEM wells and 39,429 Voluntary wells in the Water Data Library groundwater level database, gaps in groundwater monitoring persist.
- Several areas of the state lack a current groundwater management plan that addresses all related requirements of the California Water Code.

DWR is contracting with National Aeronautics and Space Administration (NASA) Jet Propulsion Laboratory for use of satellite-based radar data to measure subsidence in the Sacramento and San Joaquin valleys. NASA, the U.S. Geological Survey, and U.S. Department of Agriculture are developing an automated system for estimating fallowed agricultural acreage. For detailed information regarding groundwater and groundwater management in California, please visit DWR's Groundwater Information Center at www.water.ca.gov/groundwater. For more information regarding DWR's drought response efforts, please visit www.water.ca.gov/waterconditions.

Groundwater Basins with Potential Water Shortages and Gaps in Groundwater Monitoring

1.0 INTRODUCTION

Groundwater is a vital resource to residents, businesses, farms, and industries in California. It provides close to 40 percent of the state's water supply in an average year and as much as 45 percent in dry years. During extensive dry or drought years, groundwater can provide close to 60 percent of the water supply. Some communities are 100 percent reliant upon groundwater for municipal and agricultural purposes. Year 2013 closed as the driest year in recorded history for many areas of California. On January 17, 2014, in response to these drought conditions, Governor Brown signed a Proclamation of a State of Emergency (www.gov.ca.gov/news.php?id=18368).

2.0 PURPOSE

The purpose of this document is to address Order #11 of the Governor's Proclamation: *The Department of Water Resources will evaluate changing groundwater levels, land subsidence, and agricultural land fallowing as the drought persists and will provide a public update by April 30 that identifies groundwater basins with water shortages and details gaps in groundwater monitoring.*

Specifically, this Public Update (Update) provides information regarding groundwater basins with potential water shortages and addresses gaps in groundwater monitoring. The California Department of Water Resources (DWR) utilized available information from several sources to identify groundwater basins with potential water shortages and gaps in groundwater monitoring. Data were compiled and analyzed from the California Statewide Groundwater Elevation Monitoring (CASGEM) Program, the Water Data Library (WDL) groundwater level database, the draft Bulletin 160 *California Water Plan Update 2013*, and from well completion reports (driller's logs) submitted to DWR. The focus of this Update was to analyze the available data and identify areas with potential groundwater shortages and gaps in groundwater level monitoring; water quality concerns were not investigated or directly included in the analysis. Where feasible, the most recent and available data were considered. Since spring groundwater level measurements are typically collected in March and April, and most are subsequently uploaded to the WDL database via the CASGEM Online System by July, some spring 2014 data was not yet available to include in this Update. DWR utilized groundwater level data available as of April 15, 2014. In addition, the well completion report data are likely incomplete because there is a lag time for drillers to submit the required reports to DWR. This Update can also serve as an indicator that additional groundwater information is needed to adequately address groundwater issues in the state.

This Update responds to the specific requirement in Proclamation Order #11 to provide a report on groundwater basins and groundwater monitoring. The proclamation also directs DWR to evaluate land subsidence and agricultural land fallowing. DWR is currently working with federal agencies such as the

National Aeronautics and Space Administration (NASA) and the National Oceanic and Atmospheric Administration in a separate process to carry out this work by utilizing advanced technologies for monitoring drought impacts. DWR is contracting with NASA Jet Propulsion Laboratory for use of satellite-based Interferometric Synthetic Aperture Radar (InSAR) data to measure relative changes in land surface elevation in portions of the Sacramento and San Joaquin valleys from 2007 through 2014; this analysis is expected to be completed by early summer 2015. A test area along the California Aqueduct will also be evaluated using aircraft-based InSAR data; this work is expected to be completed about December 2014. NASA, the U.S. Geological Survey, and U.S. Department of Agriculture, National Agricultural Statistics Service are developing an automated system for DWR that will estimate fallowed agricultural acreage during the growing season. The system will rely on crop census data and on indices of vegetation greenness measured by satellite sensors. Monthly estimates of fallowed acreage will be reported from spring through fall 2014; the initial estimate is expected to be available at the end of April 2014.

3.0 FINDINGS

Groundwater is the primary supply of water in several areas of the state. Groundwater levels in these areas are more susceptible to impacts from drought conditions due to reductions in natural recharge, managed recharge, and subsurface inflow. Such reduced conditions typically result in an increase of groundwater well activity and pumping to compensate for water supply shortages. Although there may be active groundwater management programs, many areas do not have controls in place to restrict or stop groundwater pumping. Groundwater pumping is expected to increase as drought conditions worsen. The increased pumping can lead to adverse conditions including dry wells, subsidence, decreased water quality, saline intrusion, and stream depletion. Figure 1 depicts areas of the state that have a high degree of groundwater use and reliance, have experienced significant lowering of groundwater levels since spring 2010, and have experienced groundwater levels at all-time historical lows (for period of record) since spring 2008.

Water shortages and potential shortages have been identified in areas of alluvial groundwater basins and in areas that derive groundwater from fractured bedrock (foothill and mountainous areas). Several alluvial groundwater basin areas are already known to experience groundwater shortages, while other basins possess indicators associated with potential water shortage. There are several areas of the state experiencing decreasing groundwater levels and deepening of water wells.

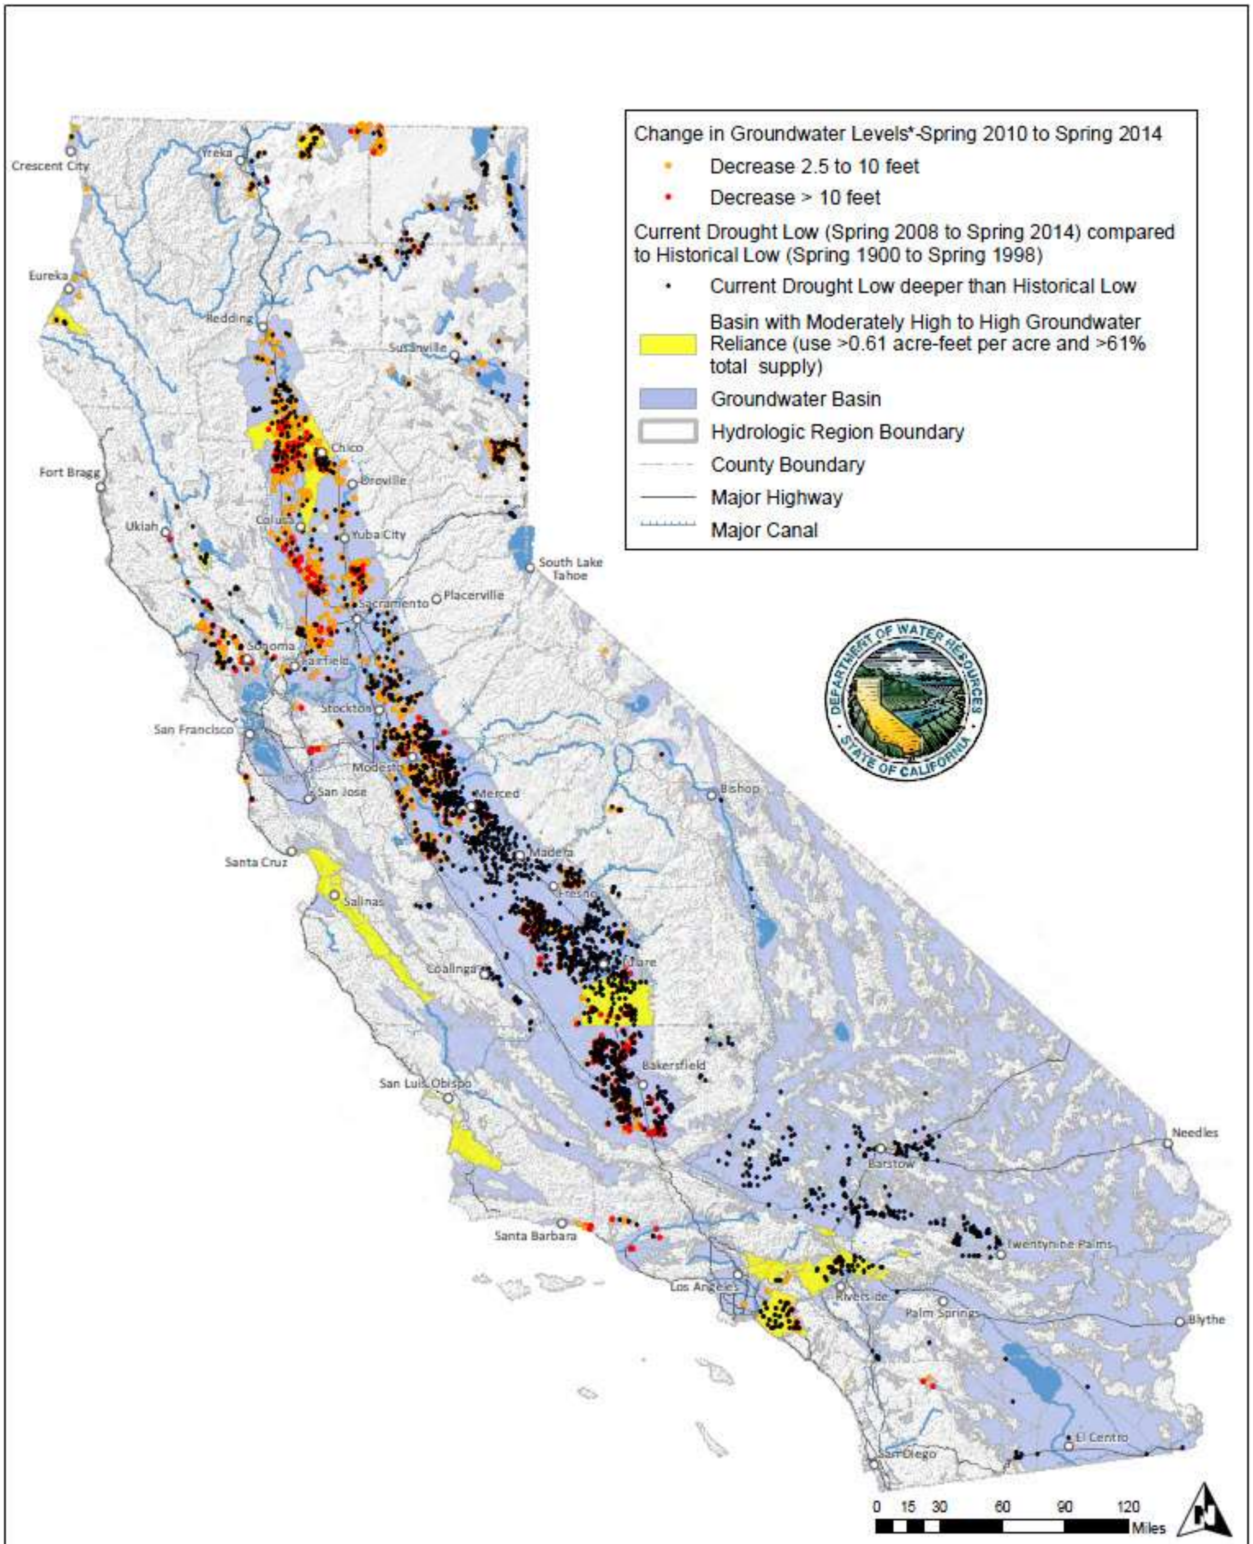
> Groundwater levels have decreased in nearly all areas of the state since spring 2013, and more notably since spring 2010. Since spring 2008, groundwater levels have experienced all-time historical lows in most areas of the state and especially in the northern portion of the San Francisco Bay Hydrologic Region, the southern San Joaquin Valley, and also for the South Lahontan and South Coast hydrologic regions – these areas exhibit groundwater levels more than 50 feet below previous historical lows experienced sometime prior to 2000. There are many areas of the San Joaquin Valley where recent groundwater levels are more than 100 feet below previous historical lows. The greatest concentration of recent well deepening activity is in the foothill areas of Nevada, Placer, and El Dorado counties. The Kaweah and Kings subbasins have the greatest numbers of deepened wells within the San Joaquin Valley. A total of 36 alluvial groundwater

> basins have a high degree of groundwater use and reliance. As such, these basins may possess greater potential to incur water shortages as a result of drought. The basins exist in five hydrologic regions: North Coast (2), Central Coast (17), Sacramento River (5), Tulare Lake (1), and South Coast (11).

Monitoring groundwater levels is critical for assessing the status of a groundwater basin over time, and is particularly important during dry years and drought conditions. There are several areas within the state that appear to lack sufficient groundwater monitoring.

> Only 169 of California's 515 alluvial groundwater basins are fully or partially monitored under the CASGEM Program. Forty of the 126 High and Medium priority basins are not monitored under CASGEM. There are significant groundwater monitoring data gaps in the Sacramento, San Joaquin River, Tulare Lake, Central Coast, and South Lahontan hydrologic regions. There are gaps on a statewide scale – basins that are not yet being monitored under the CASGEM Program, as well as gaps on the basin scale – basins with spatial data gaps. With respect to groundwater management plans, several areas of the state either lack a plan, or the existing plan has not been updated to address the requirements of the California Water Code as of 2002 (SB 1938) or 2012 (AB 359). Such areas may also lack sufficient monitoring and/or management of groundwater and are potentially subject to increased stress or impacts due to drought conditions.

Figure 1 - 2014 Drought - Potential Groundwater Shortages



*Groundwater level change determined from water level measurements in wells. Map and chart based on available data from the DWR Water Data Library as of 04/15/2014. Document Name: 2014_Drought_Potential_Groundwater_Shortages Updated: 04/23/2014 Data subject to change without notice.

4.0 GROUNDWATER BASINS WITH POTENTIAL WATER SHORTAGES

In California, most groundwater is found in basins filled with alluvial deposits. Figure 2 depicts 515 alluvial groundwater basins as defined in DWR's Bulletin 118 Update 2003 (Bulletin 118-03, www.water.ca.gov/groundwater/bulletin118/update2003). Close to 90 percent of the groundwater used in California is extracted from only about 126 of the 515 alluvial groundwater basins. Groundwater is also found in fractured bedrock in foothill and mountainous areas. However, the amount of groundwater found in fractured bedrock is relatively small compared with the amount found in alluvial basins. Nevertheless, fractured bedrock is the sole source of water supply for many communities in California, and for many individual residences.

Some communities rely solely on surface water, some rely solely on groundwater, and some rely on both surface water and groundwater to meet demands. The amount of groundwater use relative to the amount of surface water use varies greatly over the state. Figure 3 summarizes statewide contribution of groundwater compared to the total water use as reported in the draft *California Water Plan Update 2013* (www.waterplan.water.ca.gov/cwpu2013). Based on average annual data for years 2005 to 2010, groundwater use was near 16.5 million acre feet and accounted for about 39 percent of the total water supply in California.

The amount of groundwater use relative to surface water use also varies over time. In years of greater precipitation and runoff, more surface water is available to replenish groundwater basins and fractured bedrock; whereas, in dry years when less surface water is available, groundwater is relied upon to meet water demands. The practice of using surface water when available and relying more heavily on groundwater when surface water becomes scarce is known as conjunctive water use or conjunctive water management. Under conjunctive water management, during wet seasons or years, surface water replenishes groundwater basins and water levels in wells typically increase. During dry seasons or dry years, more groundwater is extracted and water levels in wells typically decline.

The decline of water levels in a groundwater basin may be a sign that water use is outpacing the short-term recharge of that groundwater basin. However, in dry years the basin may be managed such that groundwater is extracted, lowering water levels until more recharge is available in the next wet year. To be able to discern whether a groundwater basin may be in shortage, groundwater levels must be analyzed over a time period that includes dry and wet years. Some groundwater basins hold vast amounts of water with decades or centuries of water supply in the basin. Even for a basin that exhibits overdraft conditions, groundwater may not be in shortage. The activity of deepening water wells is an indicator that water levels have declined to a point where a well no longer supplies adequate water. Groundwater levels at historical lows may also be an indicator that water use in the current drought is causing a greater decline in water levels than in previous dry years or droughts.

4.1 Groundwater Well Deepening Activity

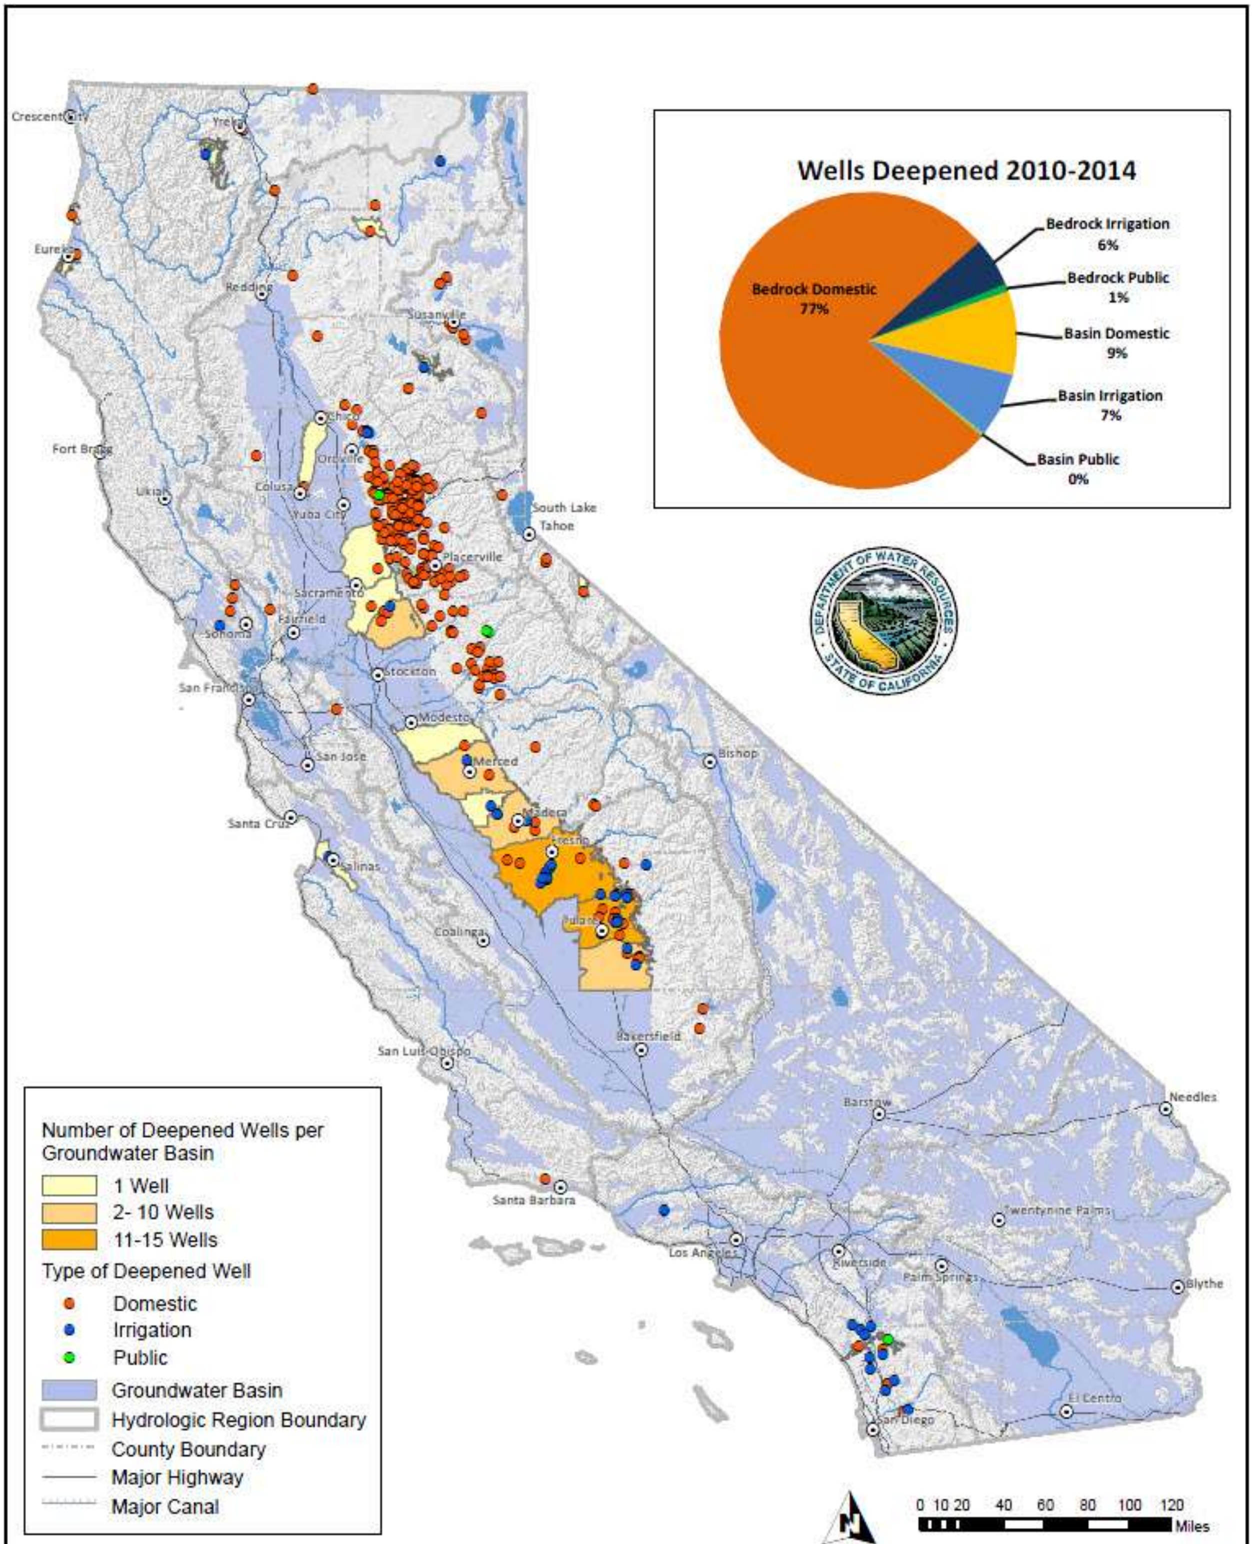
Groundwater levels typically decline during drought, and when groundwater levels decline below the level of the pump in a water well, the pump must be lowered. If groundwater levels decline to the point where the pump cannot be lowered, the yield is too small, or the well goes dry, a well owner may need to deepen the existing well or potentially drill a new well. Analysis of well completion reports (driller's logs) submitted by water well drillers can provide information about where the effects of drought may result in a water shortage.

New water wells are drilled during both wet and dry periods, including droughts. It is likely that wells are deepened primarily during dry periods when groundwater levels are declining, well yields are decreasing, or wells dry. As such, a correlation exists between the deepening of water wells and drought-related water shortages. However, there are limitations with the analysis as well completion reports do not discern if a new well is drilled to replace an existing well or if it is drilled to provide additional or new water supply.

DWR analyzed available well completion reports for water wells that were deepened from 2010 through early 2014. The analysis identified the location of each well and determined whether the well is in a defined groundwater basin or in an area of fractured bedrock. The analysis also determined whether the well is for domestic use, irrigation, or public water supply. Figure 4 depicts the locations of water wells that were deepened from 2010 through early 2014. Table 1 shows the totals for each type of water well that was deepened, by county, and whether the wells are in a groundwater basin or in an area of fractured bedrock. About 86 percent of the wells deepened are for domestic water supply, about 13 percent of the wells are for irrigation, and one (1) percent of the wells are for public water supply. About 16 percent of the wells deepened are in alluvial groundwater basins, whereas 84 percent of the wells deepened are in fractured bedrock areas. The greatest concentration of deepened wells is found in the foothill areas of Nevada, Placer, and El Dorado counties.

Table 2 shows the totals and types of water wells deepened in alluvial groundwater basins. The Kaweah and Kings subbasins have the greatest number of deepened wells. About 55 percent of the water wells deepened in groundwater basins are for domestic supply, about 43 percent of the wells are for irrigation, and two (2) percent (one well) are for public supply. The groundwater basins where water wells were deepened are highlighted on Figure 4.

Figure 4 - Water Wells Deepened 2010-2014



Data evaluated from well completion reports showing deepening received and processed by April 10, 2014. Well deepening is interpreted to indicate declining water supply in wells. Basins illustrated are interpreted to be more likely to have water shortages. Data may not be complete statewide. Data subject to change.

Table 1 - Counties with Wells Deepened from 2010 through early 2014

Findings of this analysis support a conclusion that water wells in areas of fractured bedrock are more vulnerable to water shortages than wells in groundwater basins. This conclusion is consistent with observations made during previous droughts in California (www.water.ca.gov/waterconditions). The findings of this analysis are based on available well completion reports submitted to DWR as of April 11, 2014 and those reports that were readily available for obtaining information on well deepening. There are likely additional records of deepened wells not included herein as well completion reports may be submitted up to 60 days after work is completed. Moreover, in some places, well owners may have decided to drill a new well rather than deepen an existing well. Consequently, the magnitude of possible shortages and the extent of the areas with possible water shortages may be greater than this analysis reflects.

Table 2 - Groundwater Basins with Wells Deepened from 2010 through early 2014

Hydrologic Region	Basin Number	Basin/Subbasin	Domestic	Irrigation	Public	Total

4.2 Groundwater Reliance

California Water Code Section 10933 requires DWR to prioritize California's groundwater basins and subbasins (as identified in Bulletin 118-03). In January 2014, DWR released the draft CASGEM basin prioritization process and results for public review. The final basin prioritization process and results are expected to be completed by May 2014 (www.water.ca.gov/groundwater/casgem).

To identify groundwater basins with potential water shortages, DWR used the draft CASGEM basin prioritization results related to groundwater reliance. For the CASGEM basin prioritization process, analysis of groundwater reliance included consideration of the total annual volume of groundwater use, the annual volume of groundwater use per acre, and the percent to which groundwater contributes to the overall water supply for the basin.

Using the available CASGEM data, this analysis to identify potential groundwater shortages focused on 1) basins with high groundwater use (groundwater use greater than 0.61 acre-feet per acre), and 2) basins with a high groundwater reliance relative to overall supply (groundwater reliance greater than 61 percent). A total of 36 groundwater basins (Table 3) have a moderately high or a high degree of both groundwater use and groundwater reliance. As such, these basins may possess greater potential to incur water shortages as a result of drought. Figure 1 depicts the locations of these 36 basins. The basins exist in five hydrologic regions: North Coast (2), Central Coast (17), Sacramento River (5), Tulare Lake (1), and South Coast (11). These 36 basins account for a total of about 2.54 million acres of land and a population of approximately 6.18 million. Although the basins listed in Table 3 are heavily reliant on groundwater, some of the basins are less likely than others to experience water shortages because the basin is either adjudicated (Raymond, Chino, and San Gabriel Valley) or managed by a water district (Coastal Plain of Orange County) that actively monitors and controls groundwater extraction.

Table 3 - Groundwater Basins with High Groundwater Reliance

Basin Number	Basin	Subbasin	Hydrologic Region
1-3	Butte Valley		North Coast
1-10	Eel River Valley		North Coast
3-1	Soquel Valley		Central Coast
3-2	Pajaro Valley		Central Coast
3-4.01	Salinas Valley	180/400 Foot Aquifer	Central Coast
3-4.02	Salinas Valley	East Side Aquifer	Central Coast
3-4.04	Salinas Valley	Forebay Aquifer	Central Coast
3-4.05	Salinas Valley	Upper Valley Aquifer	Central Coast
3-4.09	Salinas Valley	Langley Area	Central Coast
3-7	Carmel Valley		Central Coast
3-8	Los Osos Valley		Central Coast
3-9	San Luis Obispo Valley		Central Coast
3-12	Santa Maria		Central Coast
3-37	Villa Valley		Central Coast
3-38	Cayucos Valley		Central Coast
3-39	Old Valley		Central Coast
3-40	Toro Valley		Central Coast
3-41	Morro Valley		Central Coast
3-42	Chorro Valley		Central Coast
4-13	San Gabriel Valley		South Coast
4-23	Raymond		South Coast
5-14	Scotts Valley		Sacramento River
5-15	Big Valley		Sacramento River
5-21.51	Sacramento Valley	Corning	Sacramento River
5-21.57	Sacramento Valley	Vina	Sacramento River
5-21.58	Sacramento Valley	West Butte	Sacramento River

Table 3 - Groundwater Basins with High Groundwater Reliance (Cont.)

Basin Number	Basin	Subbasin	Hydrologic Region
5-22.13	San Joaquin Valley	Tule	Tulare Lake
8-1	Coastal Plain of Orange County		South Coast
8-2.01	Upper Santa Ana Valley	Chino	South Coast

9-4	Santa Margarita Valley		South Coast
9-10	San Pasqual Valley		South Coast

Note: Groundwater Use >0.61 acre-feet per acre and Groundwater Supply >61 percent of Total Supply

4.3 Groundwater Levels

Groundwater level measurement data are often analyzed using maps and graphs to illustrate and evaluate current or past groundwater conditions, groundwater level trends, or changes in groundwater conditions between two monitoring periods. Preparation and review of groundwater level data provides important information about where groundwater shortages could exist, and where more data are needed. Areas with relatively low groundwater levels may be more vulnerable to groundwater shortages in dry years. Also, areas or regions with declining groundwater levels may be susceptible to groundwater shortages in the future.

The maps and figures developed for this Update rely on groundwater level measurements collected during the spring. In California, spring measurements typically depict the highest groundwater elevations for the year, at a time just prior to the irrigation season and after groundwater levels have had an opportunity to rebound from winter precipitation and snowmelt. Fall measurements typically reflect groundwater conditions after the irrigation season is over and prior to winter precipitation when groundwater levels in many basins are expected to be at or near their lowest levels for the year. The groundwater level maps prepared for this Update include available data as of April 15, 2014.

Depth to groundwater contour maps use lines of equal depth to depict where the top of the groundwater surface is relative to land surface. These maps are particularly useful when considering installation of dedicated groundwater monitoring wells or the design and operating costs of new production wells. Depth to groundwater information is also useful when compared to construction depths of existing domestic and production wells. The analysis of groundwater levels can help identify areas with wells that may be impacted by the continued decline of groundwater levels. Figures 5 through 8 depict spring 2014 depth to groundwater contours for selected basins in California. The areas selected were based on the density of available data and the ability to illustrate representative contours.

Groundwater level change maps depict the difference between groundwater levels over a specified time period. Plotting the difference between groundwater level measurements collected at different times and at discrete locations is a simple way to depict changes in groundwater levels and evaluate regional trends. Figures 9 and 10 depict change of groundwater levels at well locations from spring 2013 to spring 2014 and from spring 2010 to spring 2014, respectively. Based on the available data, groundwater levels have decreased in nearly all areas of the state since spring 2013, and more notably since spring 2010.

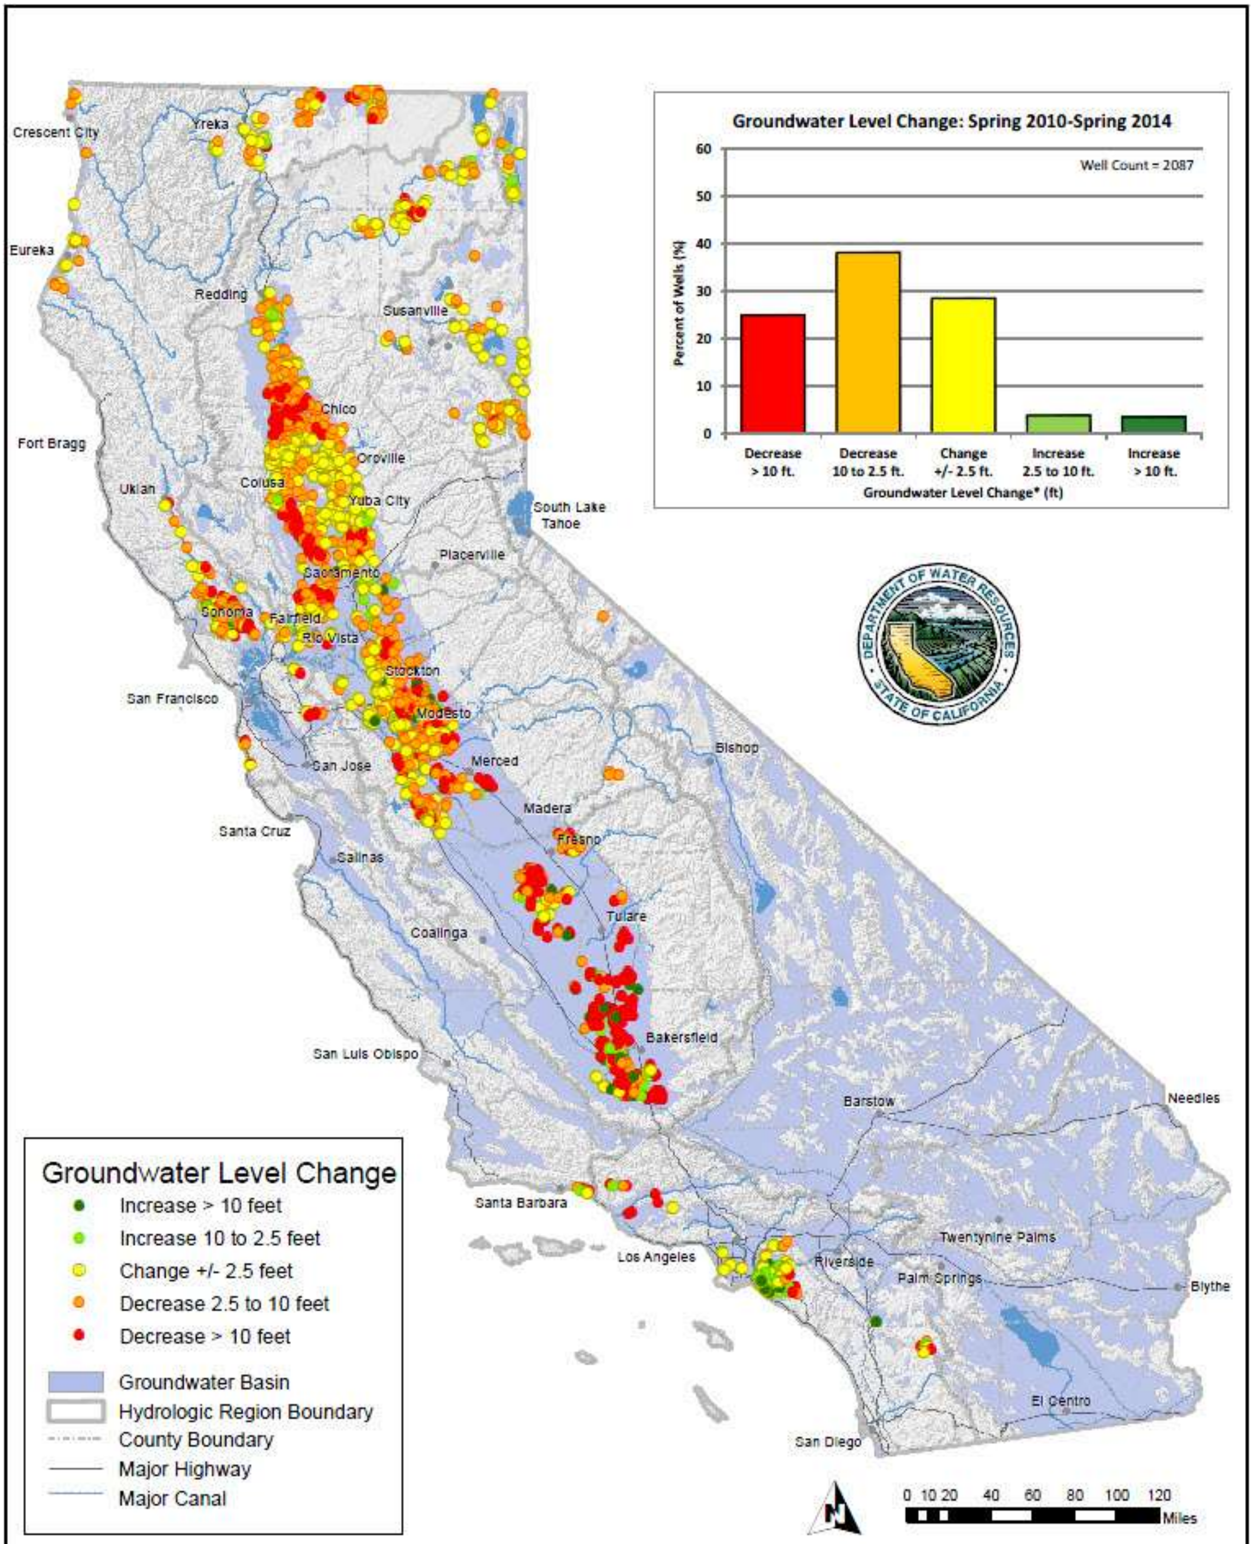
Figure 10 - Groundwater Level Change* - Spring 2010 to Spring 2014



*Groundwater level change determined from water level measurements in wells. Map and chart based on available data from the DWR Water Data Library as of 04/15/2014. Document Name: DOTMAP_S2010_S2014 Updated: 04/21/2014 Data subject to change without notice.

A more detailed method of evaluating regional differences in groundwater levels is through the use of groundwater contour change maps. Groundwater contour maps require data collected using guidelines related to the timing of data collection and the type of wells that are measured. Groundwater level change contours represent lines of equal groundwater level change. The shape, distribution, and extent of these contours also help identify the regional distribution and local magnitude of groundwater level changes. Furthermore, regional groundwater contour maps provide information about the groundwater levels where appropriate data exist and also illustrate where data is absent. Figures 11 and 12 depict regional change in groundwater levels for the Central Valley for spring 2013 to spring 2014.

Analysis of historical groundwater levels at discrete locations was also completed to evaluate recent groundwater lows compared to former historical lows. Figure 13 depicts the comparison of historical low spring levels collected between spring 1900 to 1998 to more recent low spring levels collected between spring 2008 to 2014. Since spring 2008, groundwater levels are at all-time historical lows (for period of record) in most areas of the state and especially in the northern portion of the San Francisco Bay Hydrologic Region, the southern San Joaquin Valley, and also for the South Lahontan and South Coast hydrologic regions – these areas exhibit groundwater levels more than 50 feet below previous historical lows experienced sometime prior to 2000. There are many areas of the San Joaquin Valley where recent groundwater levels are more than 100 feet below previous historical lows.

4.4 Key Hydrographs

Hydrographs depict groundwater levels for a specific well plotted over time. These graphs allow for the analysis of seasonal and long-term groundwater level variability and trends over the time period of record. For this Update, some of the same wells and hydrographs used for the draft Bulletin 160 *California Water Plan Update 2013* (www.waterplan.water.ca.gov/cwpu2013) were updated with recent groundwater level data. Due to the highly variable nature of the aquifer systems within each groundwater basin, and the effects of annual groundwater availability, recharge, and surrounding land use practices, the hydrographs presented herein are not intended to illustrate or depict aquifer conditions over a broad region. The selected hydrographs are intended to portray how the local groundwater levels respond to changing conditions over time and how the local aquifer has responded to recent drought conditions.

The wells selected for this analysis had spring 2013 and/or spring 2014 groundwater data available as of April 9, 2014. There are a total of 12 wells and six hydrologic regions included herein. The selection of wells is not exhaustive, yet they illustrate response to current drought conditions. The spring measurements typically indicate the previous year’s total groundwater extractions minus any recharge to the aquifer. Lower recharge due to dry conditions in 2012 and 2013 is expected to cause a reduction of groundwater in the aquifers, which is reflected in lower groundwater elevations. For each hydrologic region, the location of the wells and corresponding hydrographs are shown in Figures 14 through 19. The hydrographs are designated according to the State Well Number System (SWN), which identifies each well by its location using the Public Land Survey System of township, range, section, and tract. The following narratives correlate with the selected wells and hydrographs, grouped by hydrologic region.

Figure 11 - Groundwater Level Change – Northern Central Valley, Spring 2013 to Spring 2014

North Coast Hydrologic Region – Figure 14

Hydrograph 48N03E34N001M is for an irrigation well in the Tule Lake Subbasin of Klamath River Valley in the northern part of the state near the Oregon border. Relatively stable water levels existed through 2008 followed by declining levels through 2013 with a slight recovery during 2010 and 2011. For this well, the groundwater levels declined nearly 17 feet from 2008 to 2013.

Hydrograph 43N06W33C001M is for an irrigation well in the Shasta Valley Basin near the town of Gazelle in northern California. Water levels generally declined with some increase during the mid-1980s and late 1990s wet year periods. From 2011 to 2013, water levels declined about seven feet.

Hydrograph 07N09W35D002M is for a domestic well in the Santa Rosa Plain Subbasin (Santa Rosa Valley) in the city of Sebastopol, north of San Francisco. Relatively stable water levels have persisted throughout the record except during the 1976-1977 drought. Recently, the water levels declined about seven feet from 2010 to 2013.

San Francisco Bay Hydrologic Region– Figure 15

Hydrograph 05N06W02N002M is for a domestic well in the Sonoma Valley Subbasin (Napa-Sonoma Valley) in the city of El Verano, northwest of Sonoma. The surrounding area is agricultural. Water levels in this well generally show a long-term decline of about two feet per year. The water levels were relatively stable from 1974 to 2000, followed by declining water levels through 2014. The water levels have declined nearly 20 feet since 2012.

Sacramento River Hydrologic Region– Figure 16

Hydrograph 38N07E23E001M is for a domestic well in the Big Valley Basin. The Big Valley area is occupied by rural cattle ranching and hay cropping and is largely dependent on groundwater for irrigation during dry years. Water levels have fluctuated between about five to eight feet during average water years, and between about 15 to 20 feet during drought periods. Historical spring groundwater levels show gradual decline associated with the 1987-1993 drought and partial recovery after 2001. Declining water levels over time indicate that groundwater extraction is exceeding aquifer recharge in this area. Some water level recovery is noted during the 2010 and 2011 water years, yet water levels declined about 18 feet from 2012 to 2013.

Hydrograph 21N03W33A004M is for an irrigation well in the Colusa Subbasin (Sacramento Valley) in Glenn County between Orland and Willows. Water levels generally declined during the 1970s and prior to import of surface water through the Tehama-Colusa Canal. During the 1980s, groundwater levels recovered due to import and use of surface water supply and because of the 1982 to 1984 wet water years. Water levels declined again in the 2008 drought period, followed by a brief recovery during 2010 to 2011, and then returning to 2008 levels (which are notably lower than the 1977-79 drought levels).

Hydrograph 15N03W01N001M is for an industrial well in the Colusa Subbasin (Sacramento Valley) in Colusa County, north of Williams. The surrounding area is agricultural. Groundwater levels generally declined until 1978 and then recovered during the 1982-1984 wet years. After the 2008-2009 drought, water levels declined to historical lows. Water levels recovered quickly during 2010 and 2011, then after returned to the trend of long-term decline.

Figure 14 - Selected Hydrographs – North Coast Hydrologic Region

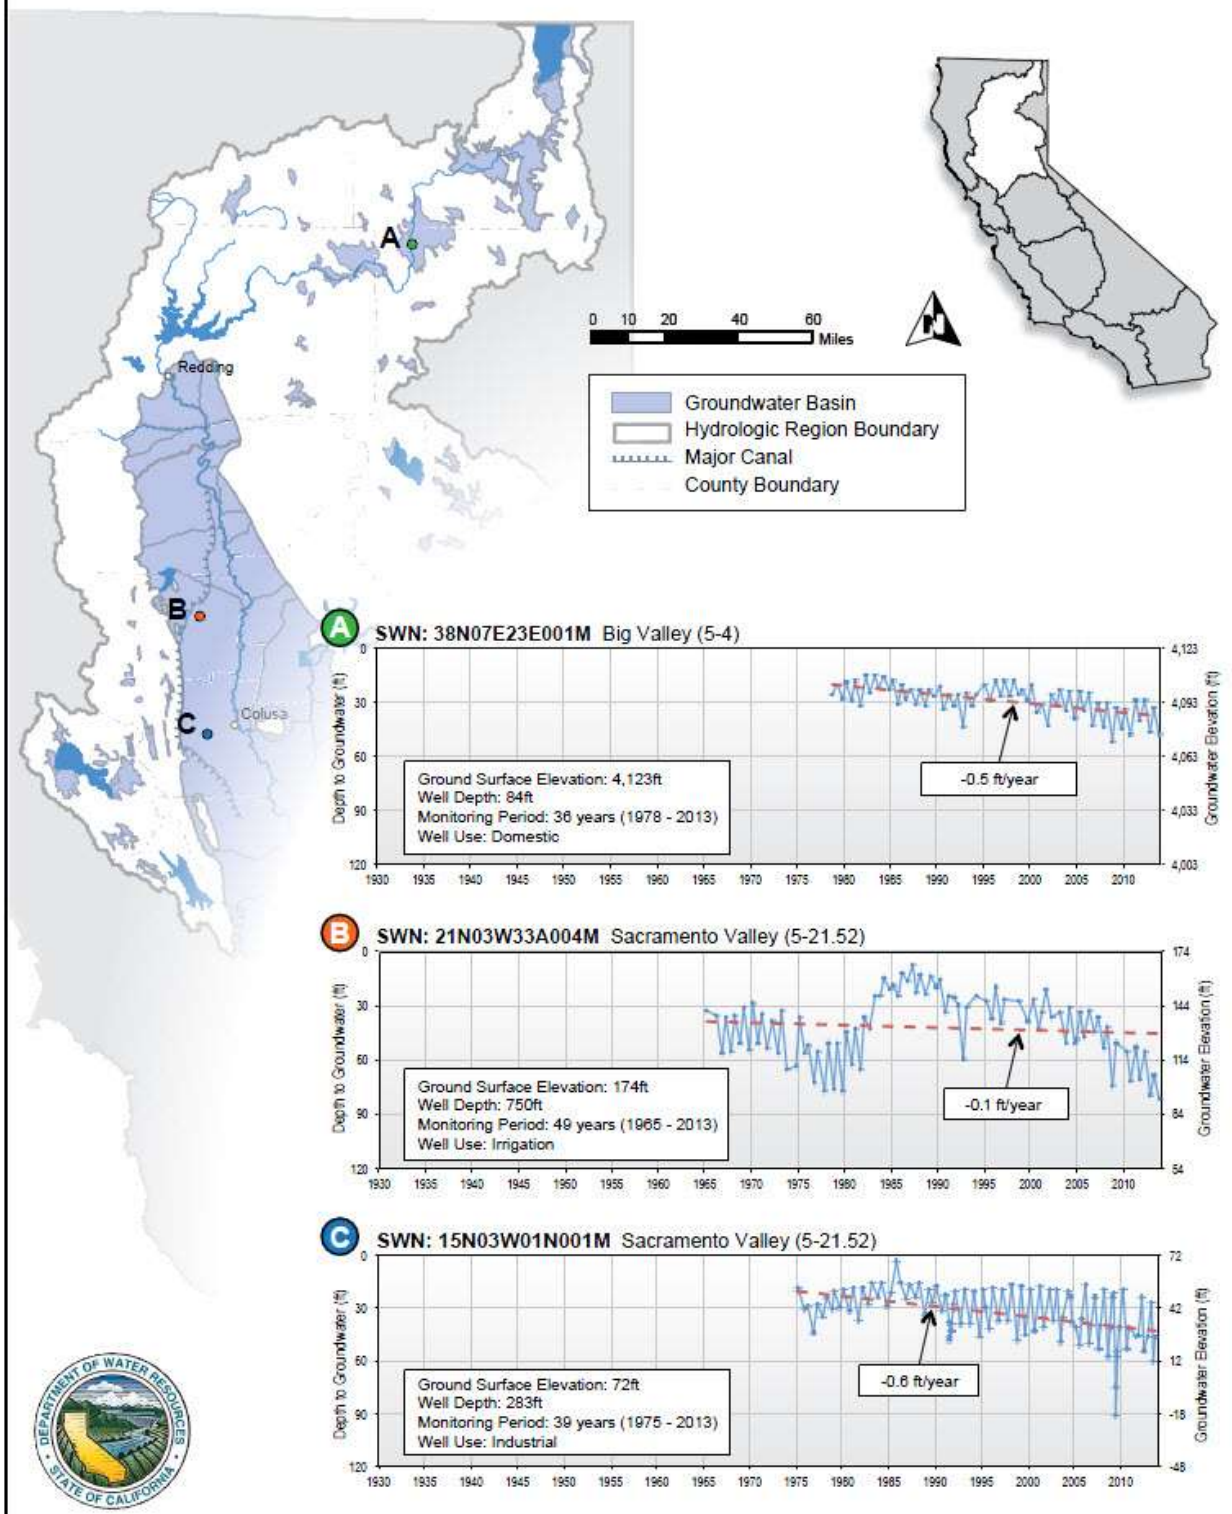
Figure 16 - Selected Hydrographs – Sacramento River Hydrologic Region



Hydrographs based on available data from the DWR Water Data Library as of April 9, 2014. Data subject to change.

San Joaquin River Hydrologic Region– Figure 17

Hydrograph 05S12E11G001M is for an irrigation well in the Turlock Subbasin (San Joaquin Valley) within the Eastside Water District, approximately 10 miles east of Turlock. The area lacks surface water and is solely dependent on groundwater. Water levels have generally declined over time. Water levels stabilized from about 1990 to 2002 likely due to utilization of efficient irrigation techniques. During 2003 and 2004, increased agricultural activity may have contributed to the declining water levels. From 2011 to 2013, the water levels declined nearly 20 feet. From 1970 to 2013, the water levels have declined a total of about 96 feet.

Hydrograph 11S10E24N001M is for an industrial well in the Delta-Mendota Subbasin (San Joaquin Valley) in western Merced County. Although water levels generally increased from 1960 to 2000, there has been a decline of almost 30 feet since 2001.

Tulare Lake Hydrologic Region– Figure 18

Hydrograph 25S26E16P001M is for an observation well in the Kern County Subbasin (San Joaquin Valley) near the Friant-Kern Canal in northern Kern County. Due to increased surface water deliveries from the Friant-Kern Canal and reduced demand on groundwater, water levels generally increased from the mid-1960s. Water levels declined slightly during 1977 and 1978 and then increased more than 30 feet during the wet years of the mid-1980s. From 1990 to 2006, the water levels remained relatively stable. Water levels declined in 2008 and 2009 then stabilized during the above average water years of 2010 and 2011. From 2007 to 2013, water levels declined a total of almost 60 feet.

North Lahontan Hydrologic Region– Figure 19

Hydrograph 29N12E16M002M is for a domestic well in the Honey Lake Valley Basin. Groundwater levels generally show a gradual decline over time, yet some recovery is noted after the 1976-1977 and the 1988-94 drought periods. Groundwater levels were at all-time lows after the 2008-2009 drought; about 25 feet below the water levels observed during the 1976-1977 drought and about 15 feet below the levels observed during the 1987-1992 drought. Water levels recovered and generally increased after the above average water year in 2011, and then declined again in 2012 and 2013 to near record lows.

Hydrograph 17N17E29B001M is for an observation well in the Martis (Truckee) Valley Basin on the eastern edge of Truckee. Water levels were relatively stable through 2007 and then abruptly declined during the 2008-2009 drought period. Water levels recovered nearly 27 feet during the 2010 to 2011 above-average water year period, and then declined almost 30 feet during the 2012-2013 drought period.

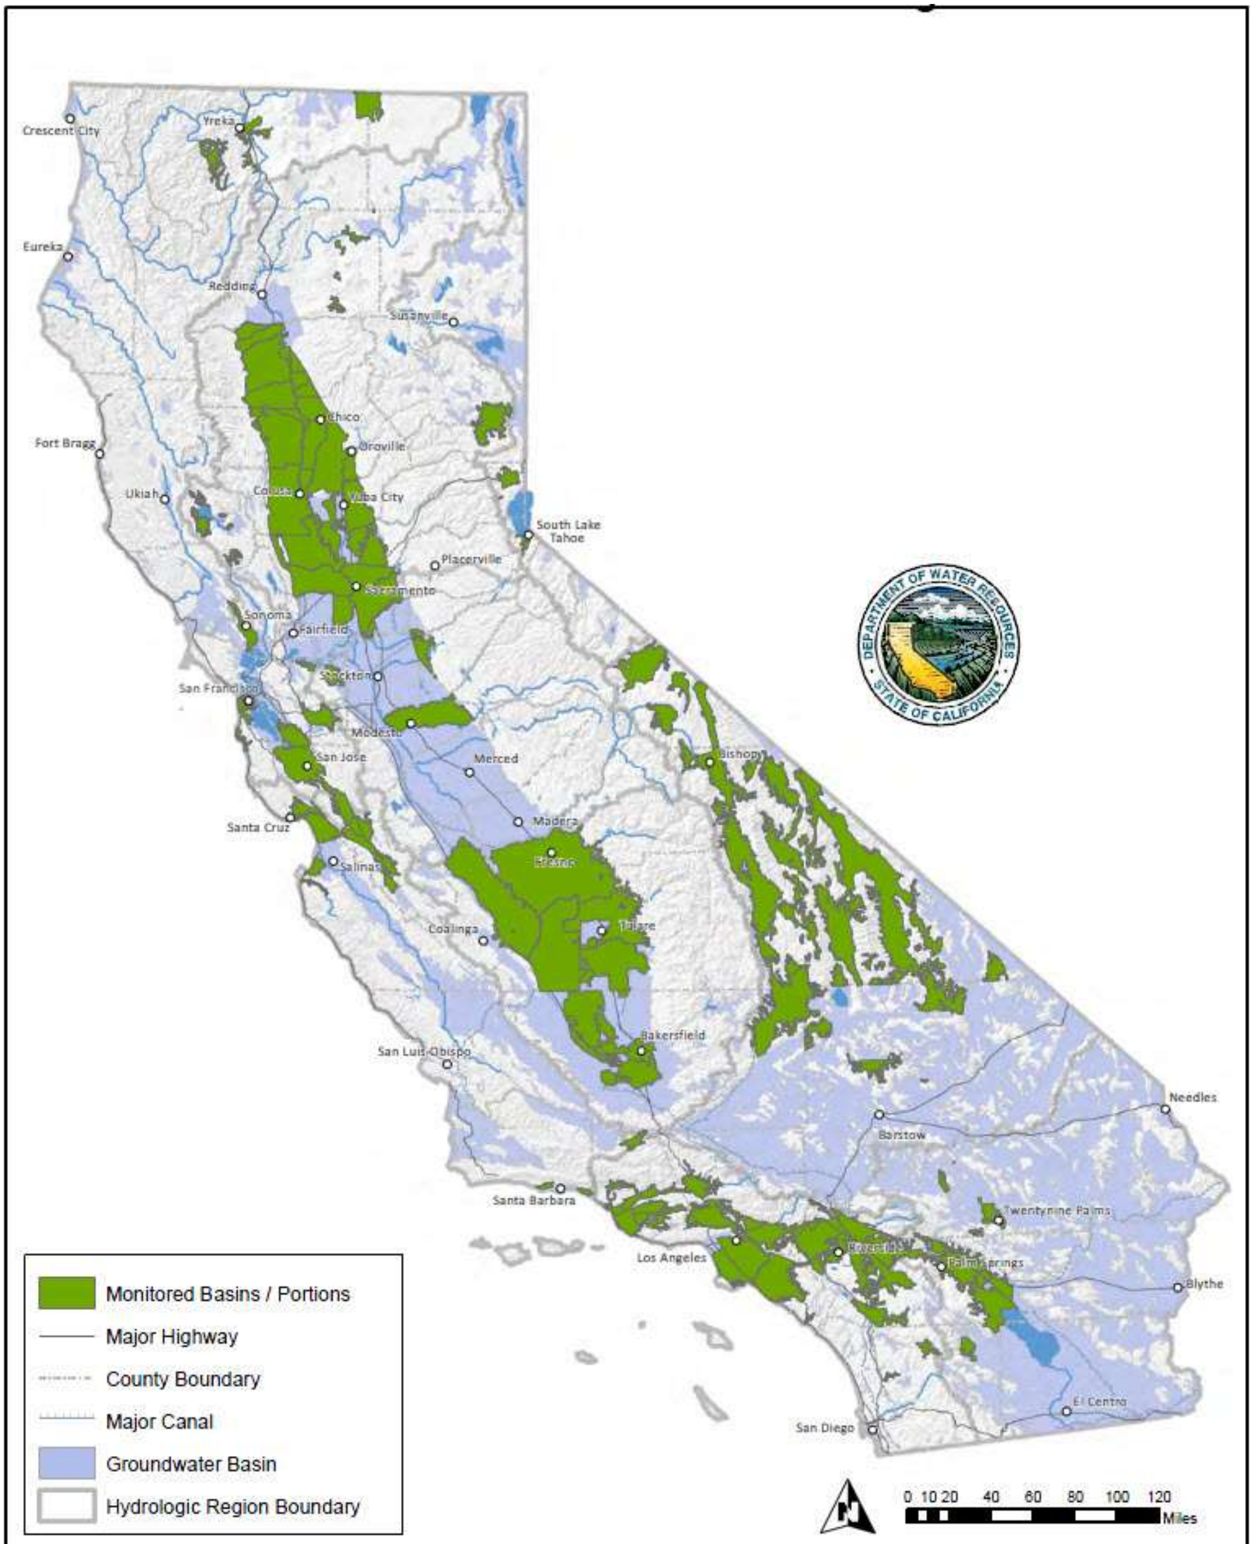
5.0 GAPS IN GROUNDWATER MONITORING

A groundwater monitoring gap is an informal term indicative of insufficient data to reasonably assess and interpret groundwater conditions in an aquifer or in a basin. There are two primary gaps that can exist in groundwater monitoring data; spatial and temporal. Spatial data gaps exist where there is inadequate horizontal and/or vertical distribution of groundwater elevation data to accurately represent or assess aquifer conditions within an area of interest (groundwater basin). Sufficient vertical distribution of data is important in groundwater basins having multiple aquifer systems at various depths, and that may also be characterized by varying levels of confinement or changing groundwater elevations. A thorough understanding of a groundwater basin's hydrogeology is essential to assess whether or not the spatial distribution of monitoring wells is adequate for a basin. Groundwater elevation data collected at routine intervals can provide seasonal and long-term trends for a basin, which are essential for accurately estimating aquifer response and change in storage associated with changing hydrology, land use, total water supply, and effects of local groundwater management practices. Temporal data gaps exist when a consistent record of groundwater elevation data, recorded over regular time intervals, is not available.

Before the CASGEM Program originated in 2009, much of the available groundwater elevation data was sourced from the WDL database. This database contained information from wells monitored by DWR and numerous cooperating agencies. While the spatial coverage was adequate in some areas of the state, evaluation of groundwater levels during the 2009 drought conditions identified data gaps in groundwater level information for most basins. In addition, well construction information was not readily available to the public due to well log confidentiality, further limiting adequate analysis of groundwater conditions in some basins. Implementation of the CASGEM Program facilitated the submittal of groundwater elevation data for many areas of the state where data was previously unavailable (www.water.ca.gov/groundwater/casgem). Monitoring Entities within the CASGEM Program are required to provide well construction information (well depth and screen intervals) for their CASGEM wells, which allows the groundwater elevation data obtained from those wells to be analyzed with increased confidence (www.water.ca.gov/groundwater/casgem/entities.cfm). Monitoring Entities are also required to obtain well owner permission prior to including their wells in the CASGEM Program, as all related data is required to be publically available. Some well owners have expressed reluctance to provide permission to the Monitoring Entity to monitor their wells and publicly release the water level and well construction information. As a result, many CASGEM Monitoring Entities have not been able to readily address data gaps in their CASGEM monitoring networks. Absent the important combination of groundwater elevation data and associated well construction information, gaps will continue to exist in the CASGEM monitoring networks. Figure 20 illustrates the statewide distribution of groundwater basins monitored under the CASGEM Program as of April 8, 2014. Only 169 of the 515 alluvial groundwater basins/subbasins are fully or partially monitored under CASGEM.

Figure 20 - Groundwater Basins and Portions of Basins Monitored* under the CASGEM Program



*Groundwater basins, subbasins, and portions of basins that have CASGEM monitoring well networks or alternative monitoring programs, approved by DWR, are considered to be monitored. Based on available data, as of 4/08/2014. Updated 04/21/2014. Data subject to change without notice.

5.1 CASGEM Basin Prioritization

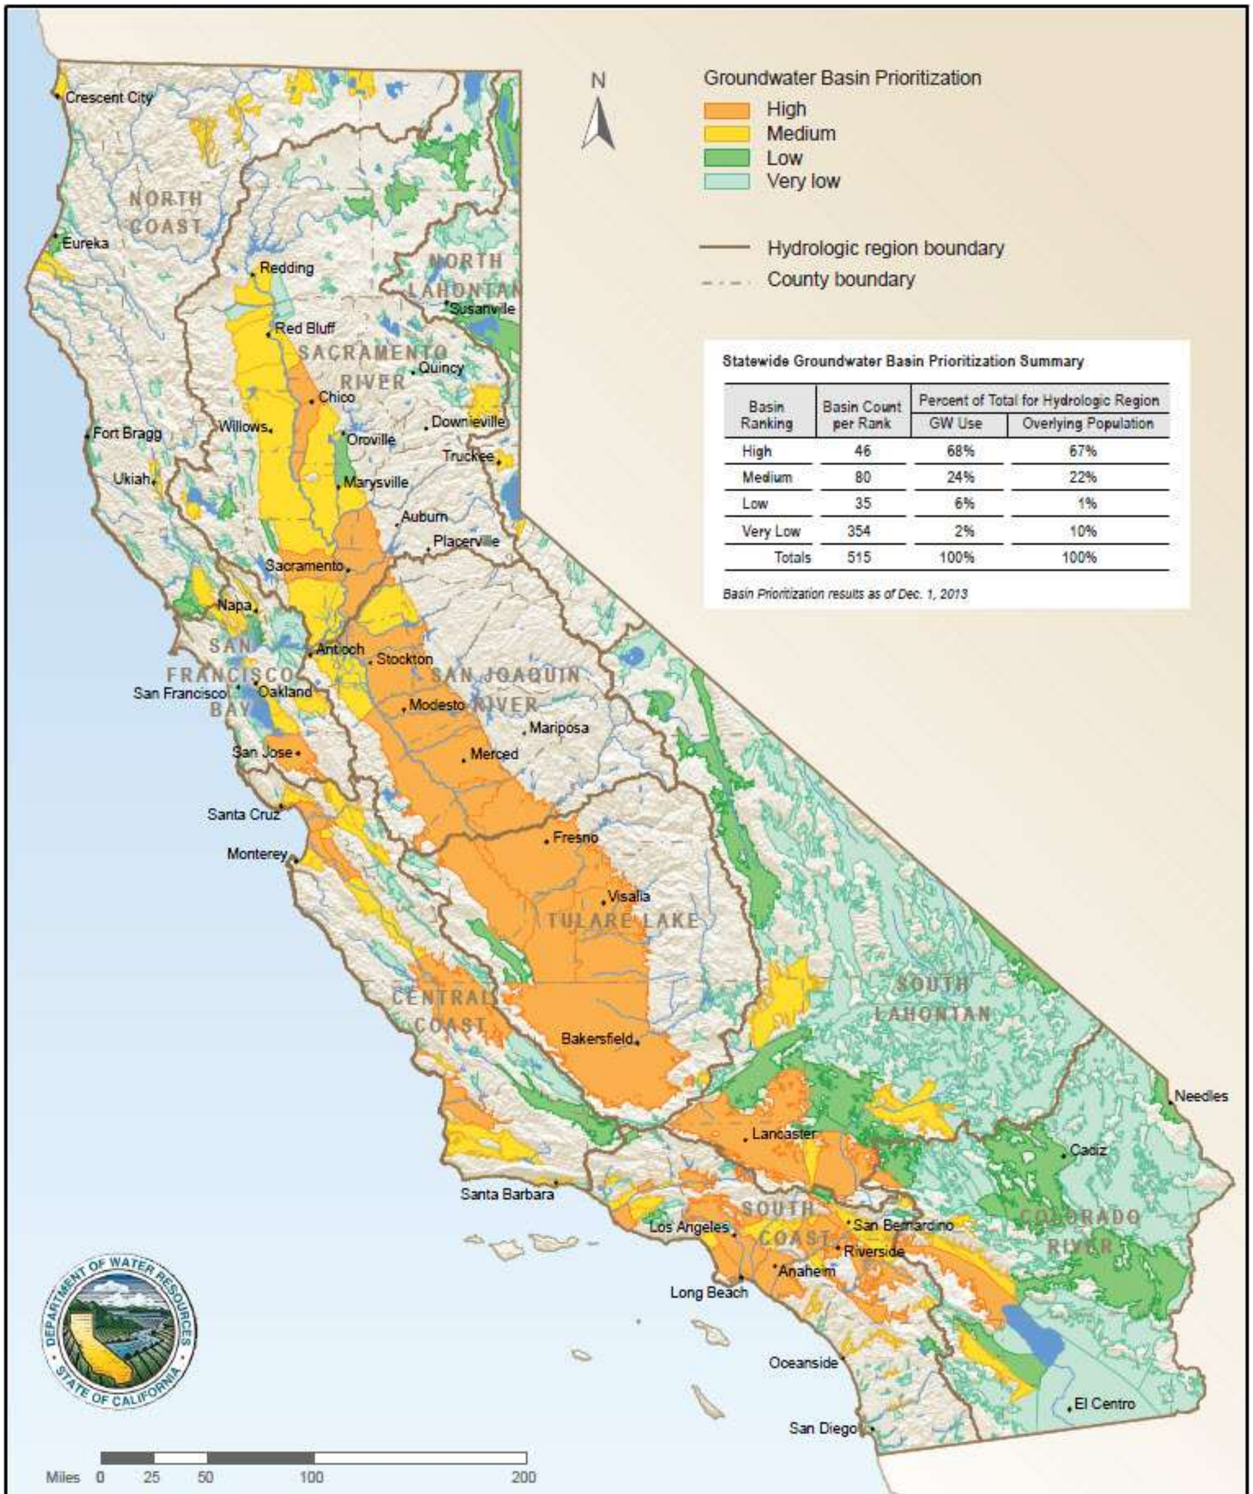
As described previously, the CASGEM basin prioritization process was developed to assess and rank the alluvial groundwater basins throughout the state. The basin prioritization process is based on an evaluation of the eight required data components specified in the California Water Code. DWR expects to finalize the draft basin prioritization process and results by May 2014.

As of December 2013, the draft basin prioritization results ranked 46 of the 515 alluvial groundwater basins as High Priority, 80 as Medium Priority, 35 as Low Priority, and 354 as Very Low Priority. Draft basin prioritization results also found that the 126 highest priority basins (High and Medium), approximately 24 percent of all of California's alluvial groundwater basins, account for close to 90 percent of California's annual groundwater use and about 90 percent of the population overlying the groundwater basins.

Figure 21 depicts the draft results of the Basin Prioritization. Many of the groundwater basins within the Central Coast and South Coast hydrologic regions, and most of the basins within the Central Valley, are ranked as either High or Medium priority. All of the groundwater basins within the Central Valley portion of the San Joaquin River and Tulare Lake hydrologic regions are ranked as High Priority. All but five of the groundwater basins in the Central Valley portion of the Sacramento River Hydrologic Region are ranked as High or Medium priority. The North Lahontan, South Lahontan, and Colorado River hydrologic regions have the lowest number of High and Medium priority groundwater basins, primarily due to the low groundwater use and population.

As of April 9, 2014, about 58 percent (73) of the High and Medium priority groundwater basins are fully monitored under the CASGEM Program. An additional 10 percent (13) of High and Medium priority basins are partially monitored under CASGEM. There are 32 percent (40) of the High and Medium priority basins not monitored under CASGEM. For 35 of the 40 unmonitored basins, there is a local agency that has indicated interest in participating in the CASGEM Program. The areas that lack participation in the CASGEM Program, and with no designated Monitoring Entity as of April 9, 2014, are considered gaps in groundwater monitoring for purposes of this Update. Figure 22 depicts the High and Medium priority basins which are currently not monitored under the CASGEM Program. There are significant monitoring gaps in the Sacramento, San Joaquin River, Central Coast, and South Lahontan hydrologic regions.

Figure 21 - Draft CASGEM Basin Prioritization



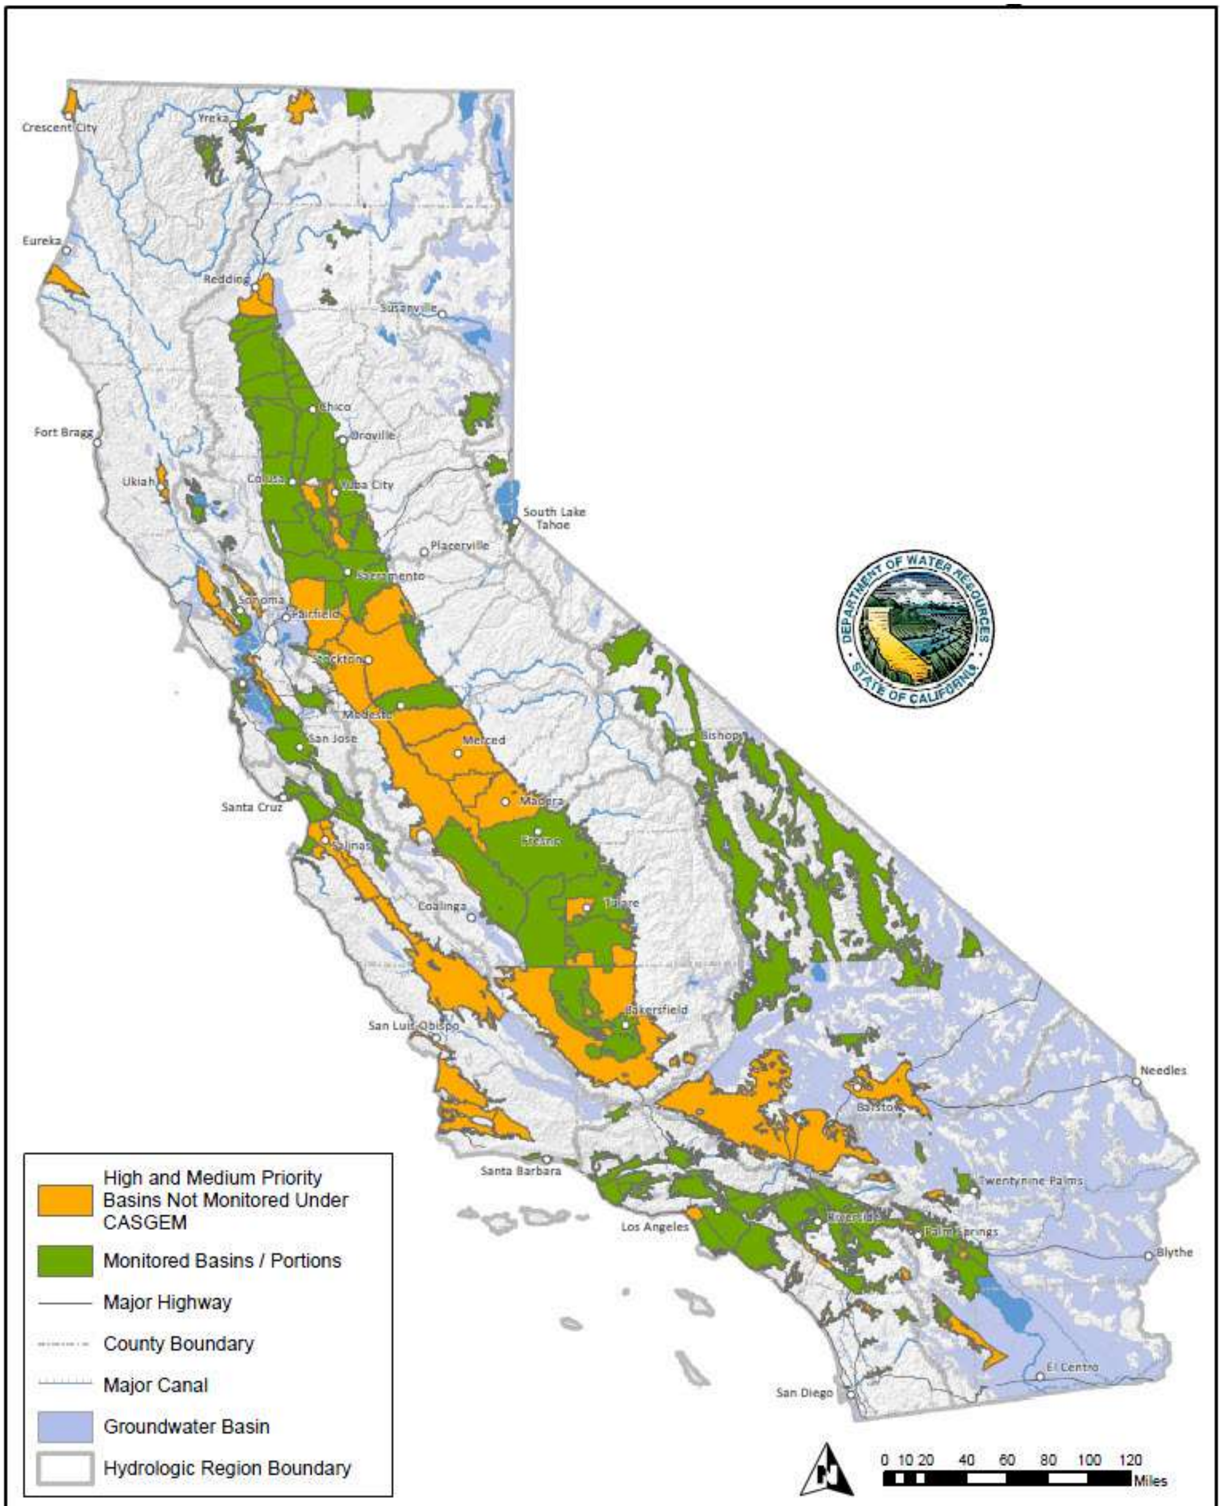
Statewide Groundwater Basin Prioritization Summary

Basin Ranking	Basin Count per Rank	Percent of Total for Hydrologic Region	
		GW Use	Overlying Population
High	46	68%	67%
Medium	80	24%	22%
Low	35	6%	1%
Very Low	354	2%	10%
Totals	515	100%	100%

Basin Prioritization results as of Dec. 1, 2013

Source: *Draft California Water Plan Update 2013*, Department of Water Resources. Information sourced from California Statewide Groundwater Elevation Monitoring Program, Draft Basin Prioritization Process and Results, December 2013.

Figure 22 - Unmonitored High and Medium Priority Basins, and Monitored* Basins under the CASGEM Program



*Groundwater basins, subbasins, and portions of basins that have CASGEM monitoring well networks or alternative monitoring programs, approved by DWR, are considered to be monitored. Based on available data, as of 4/07/2014. Updated 04/22/2014. Data subject to change without notice.

5.2 Groundwater Level Monitoring Networks

After development of the CASGEM Online System, the historical data in WDL were transferred to an updated WDL groundwater level database that contains additional data fields specific to the CASGEM Program. Both the CASGEM Online System and WDL interface allow users to view the network of groundwater elevation monitoring locations throughout the state. The individual wells are classified as either "CASGEM" or "Voluntary" wells. CASGEM wells and measurements are used specifically for a CASGEM groundwater elevation monitoring network. Because CASGEM wells are required to be monitored with sufficient frequency to capture data that represents seasonal groundwater elevations within basins, they are also suitable for use in trend analyses. CASGEM wells may possess data prior to the start of the CASGEM Program due to migration of historical data to the updated WDL database, or submittal of historical data by the Monitoring Entity. Well construction information is not disclosed for "Voluntary" wells. While the groundwater elevation data that are provided for voluntary wells may be useful to observe trends in a given well, these data are less useful for conducting more extensive hydrologic analysis such as basin trends and elevation contouring, especially in groundwater basins that have multiple distinct aquifer zones. Figure 23 shows the statewide distribution of groundwater monitoring data for spring 2013. There are significant monitoring gaps in the San Joaquin River, Tulare Lake, Central Coast, and South Lahontan hydrologic regions.

As of April 9, 2014, a total of 169 of the 515 alluvial groundwater basins have a designated Monitoring Entity under the CASGEM Program who is actively monitoring their CASGEM wells. Statewide, there are 4,122 CASGEM wells and 39,429 Voluntary wells represented in the WDL groundwater level database. Despite the monumental progress realized by implementation of the CASGEM Program during the past four years, additional work is needed to establish adequate statewide monitoring of the groundwater basins. There are gaps on a statewide scale – basins that are not yet being monitored under the CASGEM Program, as well as gaps on the basin scale – basins with spatial data gaps. DWR is working cooperatively with Monitoring Entities to improve the existing statewide CASGEM monitoring network and reduce data gaps. Figures 24 through 26 depict the existing CASGEM monitoring networks.

5.3 Groundwater Management

Groundwater plays a key role in meeting California's water supply needs. The effective management of groundwater basins is an essential aspect to maintaining the reliability and sustainability of this vital resource. Components that are essential to groundwater management programs include and/or address the following; basin management objectives (BMOs) with performance monitoring programs for groundwater levels, groundwater quality, land subsidence, and the interactions of groundwater and surface water to evaluate effectiveness of groundwater management activities.

Although California law does not require local agencies to adopt or implement groundwater management plans (GWMPs) or groundwater management programs, incentives exist to encourage local agencies to adopt and implement a GWMP that promotes effective groundwater management. Section 10750 et seq. of the California Water Code requires that six specific components be included in a GWMP for an agency to be eligible for State funding administered by DWR for groundwater projects. The required components include BMOs, agency cooperation, mapping recharge areas, monitoring protocols, and appropriate use of geologic and hydrologic principles for areas outside of alluvial basins.

As part of the draft Bulletin 160 *California Water Plan Update 2013*, DWR reviewed 119 GWMPs (those available as of August 2012) and determined which plans were completed in accordance with the California Water Code as of 2002 [enactment of Senate Bill (SB) 1938]. SB 1938 required that a GWMP have components relating to 1) the monitoring and management of groundwater levels within the basin, 2) groundwater quality degradation, 3) inelastic land subsidence, and 4) changes of surface flow and water quality that directly affect groundwater levels or quality, or are caused by groundwater pumping in the basin.

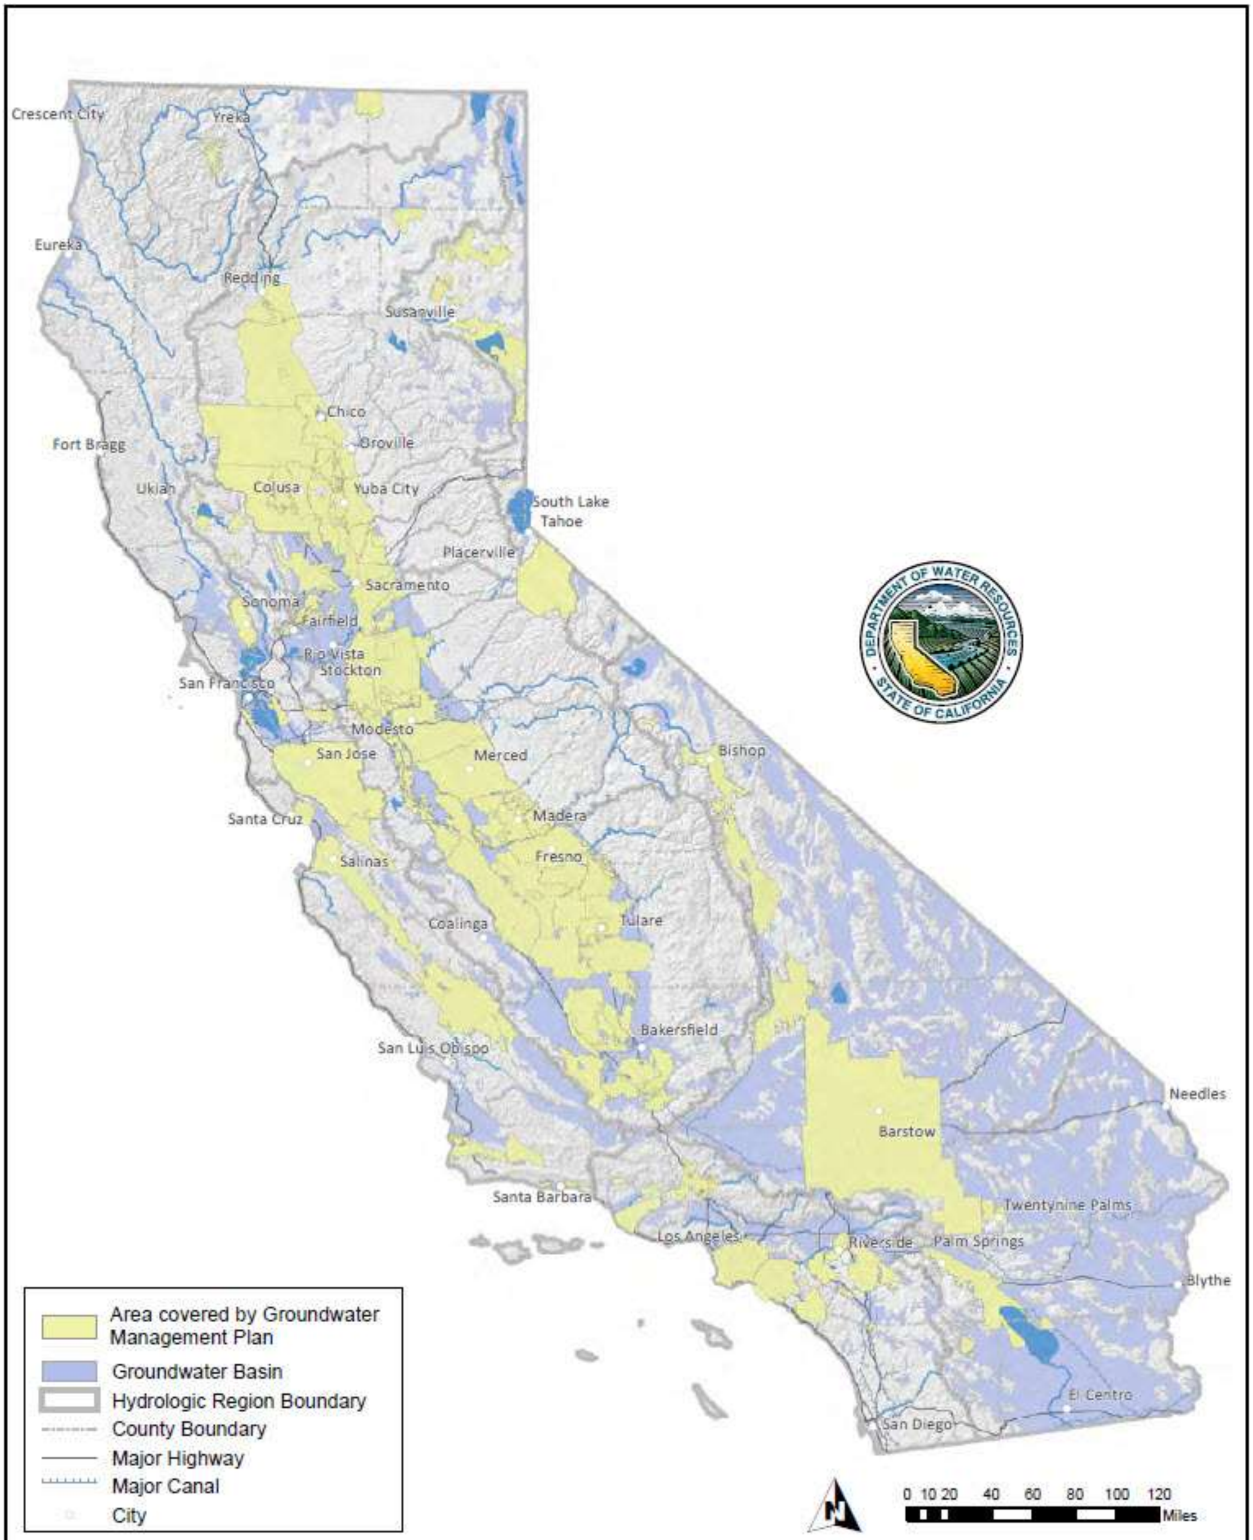
Of the 119 GWMPs, 83 were determined to meet the California Water Code requirements implemented as a result of SB 1938 in 2002. DWR also performed a detailed review of these 83 plans to assess their adherence to the required monitoring and management components. Out of the 83 plans, approximately 90 percent are implementing basin monitoring objectives and protocols for monitoring groundwater levels and groundwater water quality. About 75 percent of the plans have implemented or have provisions to implement monitoring for inelastic land subsidence. Only about 50 percent of the plans address surface water and groundwater interactions. In terms of groundwater management coverage area, about 42 percent of alluvial groundwater basins are encompassed by a GWMP. Also, about 32 percent of alluvial groundwater basins are encompassed by a GWMP determined to address water code requirements pursuant to SB 1938.

GWMPs continue to be developed and updated by the local implementing agencies. For example, plans developed prior to SB 1938 may adopt the provisions of SB 1938 and possibly the more recent additions to the California Water Code in 2012 [enactment of Assembly Bill (AB) 359] concerning groundwater recharge mapping to meet the current requirements. Typical reasons for updating plans are due to changes in basin conditions, changes in legislation, changes in water supply profiles, or increased understanding of the hydrogeology. As of March 20, 2014, the number of GWMPs available to DWR has increased from 119 to 130. A detailed review or analysis of the 11 additional plans has not been conducted. Currently, DWR does not have specific statutory direction regarding any further evaluation of GWMPs.

Figure 27 depicts the GWMP areas throughout California as of October 2013. The GWMP areas are represented as those that were implemented prior to SB 1938, those implemented after SB 1938, and those that also include groundwater recharge mapping pursuant to AB 359.

With respect to GWMPs, several areas of the state either lack a plan, or the existing plan has not been updated to address the requirements of SB 1938. In most cases, plans do not meet the groundwater recharge mapping requirements of AB 359. Reasons vary, but generally it is lack of funding or technical resources to create new or updated GWMPs to meet the necessary elements required by the California Water Code. As a result, such areas may also lack sufficient monitoring and/or management of groundwater and are potentially subject to increased stress or impacts due to drought conditions. For detailed information regarding GWMPs in California, please visit DWRs Groundwater Information Center at www.water.ca.gov/groundwater.

Figure 27 - Groundwater Management Plans



GWMP areas throughout California as of October 2013. The GWMP areas are represented as those that were implemented prior to SB 1938, those implemented after SB 1938, and those that also include groundwater recharge mapping pursuant to AB 359. Document Name: Statewide_GWMP_20140423 Updated: 04/24/2014 Data subject to change without notice.

6.0 CONCLUSION

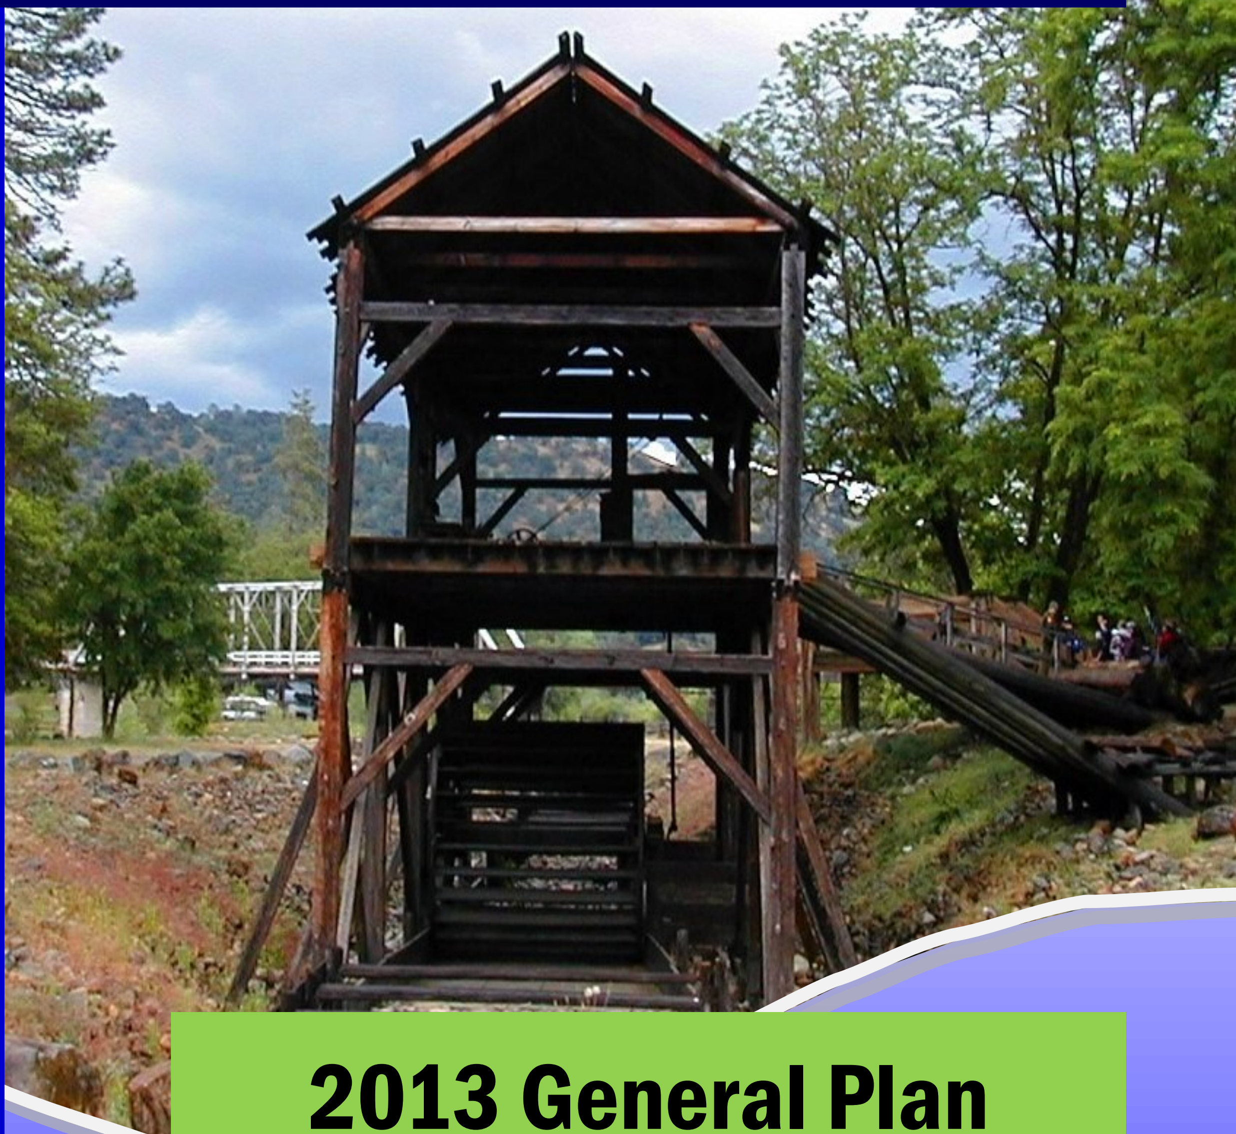
Groundwater can serve as the primary supply, and in some cases the only option, to meet water demands in many areas of the state. Draft CASGEM basin prioritization results found that the 126 highest-priority basins (High and Medium) account for close to 90 percent of California's annual groundwater use and about 90 percent of the population overlying the groundwater basins. There are 36 alluvial basins that are highly reliant on groundwater and possess the potential for water shortages due to the stress of drought conditions. These 36 basins account for a total of about 2.54 million acres of land and a population of approximately 6.18 million. Based on the available groundwater level data, there are several areas of the state with recent groundwater levels at all-time historical lows. Groundwater levels throughout the state have generally declined since spring 2013, and more notably compared to levels observed during the last normal water year of 2010. Many basins and counties have experienced significant water well deepening activities since 2010—an activity indicative of declining groundwater levels. Key hydrographs for selected wells throughout the state provide a longer term analysis of water level trends in conjunction with recent declines caused by drought conditions.

Statewide, there are 4,122 CASGEM wells and 39,429 Voluntary wells represented in the WDL groundwater level database. Although there is a fairly robust network of monitoring wells available to assess groundwater conditions, gaps in groundwater monitoring persist. There are 40 High and Medium priority alluvial groundwater basins that are currently not monitored under the CASGEM Program, and another 13 basins that are only partially monitored. Based on monitoring data within the WDL database for 2013, there are notable gaps in groundwater level data for the San Joaquin River, Tulare Lake, Central Coast, and South Lahontan hydrologic regions. With respect to groundwater management planning, several areas of the state either lack a GWMP, or the existing plan has not been updated to address the requirements of the California Water Code as of 2002 (SB 1938) or 2012 (AB 359). Although a local agency may have an adopted GWMP, many areas do not have controls in place to restrict or stop groundwater pumping. Groundwater pumping is expected to increase as drought conditions worsen. The increased pumping can lead to adverse or severe conditions including dry wells, land subsidence, decreased water quality, saline intrusion, and stream depletion.

This Update can also serve as an indicator that additional groundwater information is needed to adequately address groundwater issues in the state. DWR is making progress to fulfill the objectives and actions included in the Governor's California Water Action Plan, and to implement the next phase of the CASGEM Program. DWR promotes sustainable groundwater management at the local and regional level through technical guidance, financial assistance, interagency coordination, groundwater monitoring, basin assessments, and advancement of integrated regional water management. For detailed information regarding groundwater and groundwater management in California, please visit DWR's Groundwater Information Center at www.water.ca.gov/groundwater. For more information regarding DWR's drought response efforts, please visit www.water.ca.gov/waterconditions.

291112 Part 2

County of El Dorado



2013 General Plan Annual Progress Report

Strategic Planning For Our Future

Community Development Agency
Long Range Planning Division

June 2014

TABLE OF CONTENTS

1. PURPOSE OF THIS REPORT

An annual progress report for General Plan implementation is required to be submitted to the County Board of Supervisors, the State Office of Planning and Research (OPR), and the State Department of Housing and Community Development (HCD) that includes:

- The status of the General Plan and progress in its implementation;
- The County's progress in meeting its share of the regional housing needs;
- Local efforts to remove governmental constraints to the maintenance, improvement and development of housing; and
- The degree to which the County's approved General Plan complies with the State General Plan Guidelines and the date of the last revision to the General Plan.

This report has been prepared pursuant to Government Code Section 65400 (a), which requires that all counties shall "investigate and make recommendations to the legislative body regarding reasonable and practical means for implementing the General Plan or element of the General Plan, so that it will serve as an effective guide for orderly growth and development, preservation and conservation of open-space land and natural resources, and the efficient expenditure of public funds relating to the subjects addressed in the General Plan."

In addition, this report supports General Plan Policy 2.9.1.1 which states that the County must "monitor, on an annual basis, the rate at which the land inventory is developed, the population and employment growth of the County, and other useful indicators of the County's growth." As directed by the General Plan (Policies 2.9.1.2, 2.9.1.3 and 2.9.1.4), the results of this monitoring process are to be examined at five year intervals. If the monitoring results indicate that the distribution of growth varies significantly from the major assumptions of this Plan, the County may make appropriate adjustments to the Plan's development potential, including the adjustment of Community Region and Rural Center boundaries, as part of the five year review process. The last General Plan five-year review was completed in April 2011. The next five year review must be submitted to the State by October 1, 2016.

Further, this report also addresses compliance with County-specific monitoring requirements, such as General Plan Policy 2.9.1.5 (periodic review of Policies and Implementation Measures that may reduce environmental damage). Information from this report may be used for identification of necessary adjustments, if any, that should be made to further implement the General Plan. This report will also help identify emerging trends in housing, employment, land development, and population growth to ensure that the General Plan continues to adequately address and meet the needs of El Dorado County residents and visitors for the foreseeable future.

2. EXECUTIVE SUMMARY

The General Plan includes nine areas of review, or Elements: 1) Land Use, 2) Transportation and Circulation, 3) Housing, 4) Public Services and Utilities, 5) Public Health, Safety and Noise, 6) Conservation and Open Space, 7) Agriculture and Forestry, 8) Parks and Recreation and 9) Economic Development. Each General Plan Element includes an implementation program with a list of implementation measures that are linked to annual work schedules.

The General Plan currently has a total of 225 implementation measures which are the collective responsibility of several County departments, divisions or agencies. Overall, the County has made significant progress toward implementation of the General Plan since its adoption in 2004. Of the 225 total measures, 142 (63 percent) have been implemented, 61 (27 percent) are in progress, and 22 (10 percent) remain to be initiated and implemented. The status of each of these measures, including specific actions and timeframes associated with the implementation of each of these Elements is included in Appendix A.

This report focuses on highlighting both achievements and challenges during calendar year 2013, and the measures that are in progress and still remain to be implemented.

Major Planning Activities in 2013

Below is a highlight of significant planning activities related to General Plan implementation either completed or ongoing from the 2013 calendar year. General Plan implementation tasks are also discussed in detail under appropriate section(s) for each General Plan Element.

General Plan Housing Element Update

On October 29, 2013, the County Board of Supervisors adopted the 2013-2021 Housing Element to the Adopted General Plan. State housing element law requires local governments to update the housing element by the due date specified in statute, generally for either a five-year or eight-year planning period. The previous Housing Element was adopted on July 1, 2008 and amended on April 21, 2009.

The Housing Element is part of the County's General Plan designed to address the existing and projected housing needs of all economic segments of the community. The Housing Element serves as a framework to assess the County's housing needs and establishes the County's housing policies. It is intended to ensure that decent, safe, and affordable shelter is provided for all residents of unincorporated areas of the county.

The Housing Element update process began in January 2012 and was completed with extensive public outreach including public workshops, community meetings, interviews with community residents, surveys, and other input. In November 2013, the County received a certification of compliance from the California Department of Housing and Community Development (HCD) for its adopted 2013-2021 Housing Element.

The County's progress in meeting Housing Element goals is described in detail in the Housing Element Report (Appendix B). The Housing Element Report provides the status of accomplishing the Housing Element implementation program, along with details on the progress of meeting regional housing needs, as well as removing governmental constraints to the development of affordable housing.

Targeted General Plan and Comprehensive Zoning Ordinance Update

On November 14, 2011 the Board of Supervisors adopted Resolutions of Intention to amend selected General Plan policies and to complete a comprehensive update to the Zoning Ordinance (TGPA-ZOU project) in order to achieve the following goals:

1. Bring differences between the General Plan and other County planning ordinances and manuals into a more useful, beneficial and consistent format;
2. Create a series of changes (reform) to the current regulatory process;
3. Achieve adoption of:
    a. A Zoning Code consistent with the 2004 General Plan;
    b. Targeted General Plan amendments;
    c. A required 2013 Housing Element Update;
4. Complete a Travel Demand Model (TDM) Update

This followed a year-long process of review and consideration of changes determined necessary following recent changes in State law, changes in development patterns and market demand, and findings from the previous General Plan 5-year review. A final Travel Demand Model [Goal 4] was completed in October 2013 and the 2013 Housing Element Update was completed in November 2013 [Goal 3 (c)]. The balance of the TGPA-ZOU [Goals 1, 2, 3(a) and 3 (b)] is still in progress, with final completion tentatively scheduled for October 2014.

Sign Ordinance Update

In December of 2012, the County executed a contract with Pacific Municipal Consultants, Inc. (PMC) for the preparation of a comprehensive sign ordinance amendment and the related Environmental Impact Report (EIR). The project was initiated in January of 2013 with a presentation by PMC at a joint meeting of the Board and the Planning Commission. In June of 2013, the Board authorized the Sign Ordinance Public Draft to be released for a 60-day review period. The public draft was released on July 8, 2013 and the public comment period closed on September 10, 2013. Written comments were submitted by forty-two individuals and seven agencies. In December of 2013, staff presented to the Board a general summary of the public comments received and asked the Board for direction on several policy issues identified in the public comments. The Board's direction required revisions to the draft sign ordinance which will be presented to the Board in 2014, along with the final EIR, for approval and adoption.

Airport Land Use Compatibility Plan (ALUCP) General Plan Conformance Amendment

On June 28, 2012, the El Dorado County Transportation Commission (EDCTC), acting as the El Dorado County Airport Land Use Commission, adopted Airport Land Use Compatibility Plans (ALUCPs) for the Cameron Park, Georgetown, and Placerville airports (File No. A13-0003). The plans provide guidance and standards for land uses within the vicinity of the airports to protect public safety and to ensure safe operation of the airports in compliance with the California State Aeronautics Act (Public Utilities Code §21670 et seq.) Government Code §65302.3 requires cities and counties to amend their General Plans so that they are consistent with the policies of an adopted ALUCP. On May 7, 2013, the County initiated the process to reconcile the General Plan to the newly-approved ALUCP's. Subsequently, Resolution of Intention Number ROI 017-2014 was submitted March 4, 2014 to the Board of Supervisors to initiate the required changes. More information about Airport Land Use Compatibility Plans is available at: http://www.edctc.org/2/Airports.html.

3. GENERAL PLAN OVERVIEW

Background and History

The El Dorado County General Plan was adopted on July 19, 2004 by the Board of Supervisors and ratified by public referendum on March 15, 2005. This represents the first comprehensive General Plan update since 1996.

Prior to adoption of the 2004 General Plan, implementation of the previous 1996 General Plan was largely suspended in 1999 by a court order ("Writ of Mandate") from the Sacramento Superior Court (*El Dorado County Taxpayers for Quality Growth, et al. v. El Dorado County Board of Supervisors*) on the grounds that the 1996 General Plan Environmental Impact Report (EIR) did not adequately analyze potential environmental impacts as required by the California Environmental Quality Act (CEQA). On September 1, 2005, the County requested that the Court re-review the case after the completion of a new EIR associated with the new 2004 General Plan. The Court ruled that the County had satisfied every term of the writ and it was discharged. The Court's ruling was appealed by the plaintiffs. However, on April 18, 2006, the County entered into a settlement agreement with the plaintiffs, settling the lawsuit and allowing full implementation of the 2004 General Plan.

State General Plan Annual Progress Report Guidelines

The Governor's Office of Planning and Research (OPR) provide suggested content for the General Plan Annual Progress Report (APR). The content below is based on recommendations from the OPR's General Plan Annual Progress Report Guidance.

1. ***Introduction***

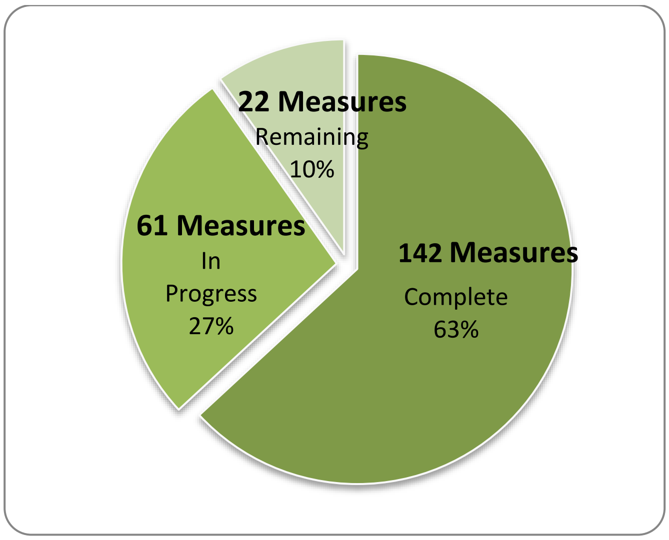
2. ***Table of Contents***

3. ***Date of presentation/acceptance by the local legislative body (agenda item or resolution)***

   The APR was presented to the Board of Supervisors on June 24, 2014. Additional details from this hearing are available on the Board of Supervisor's web site at: http://edcgov.us/BOS/

4. *Measures associated with the implementation of the General Plan with specific reference to individual element*

The Board of Supervisors approved an Implementation Plan as part of the 2004 General Plan. The Board subsequently amended the Implementation Plan on October 29, 2013 with the Housing Element update. The amended Implementation Plan contains a total of 225 implementation measures. Since full General Plan implementation began in 2006, 142 measures have been implemented or are ongoing, 61 measures are in progress, and 22 measures have not yet been addressed.



A comprehensive list of all the implementation measures, by element, with the status of each measure for calendar year 2013, is included in Appendix A.

5. *Housing Element Reporting Requirements*

Government Code Section 65400 establishes the requirement that each city or county prepare an annual report on the status of the Housing Element of its General Plan and progress in its implementation using forms and definitions adopted by the Department of Housing and Community Development (HCD).

The 2013-2021 Housing Element adopted on October 29, 2013 includes 35 Implementation Measures. The implementation status of each of these measures is provided in Table C of the 2013 Housing Element Annual Progress Report which was presented to the County Board of Supervisors in March 2014. The 2013 Housing Element Implementation Progress Report is included as Appendix B.

6. *The degree to which the General Plan complies with OPR's General Plan Guidelines*

The General Plan has been prepared using the State General Plan Guidelines (Government Code Section 65040.2), and includes the seven mandatory elements and four additional elements. The seven State-mandated elements of the General Plan include Land Use, Mobility (Transportation and Circulation), Housing, Conservation, Open Space, Noise, and Safety. The County General Plan includes the above mandatory elements plus four additional elements: Public Services and Utilities, Agriculture and Forestry, Parks and Recreation and Economic Development. The Conservation and Open Space Elements are combined together as one element. In addition, Public Health has been added to the combined Noise and Safety Element.

7. *The date of the last update to the General Plan*

The General Plan was last comprehensively updated in July, 2004. In 2013, the General Plan was amended three times, to include:

- **October 29, 2013:** The Housing Element was updated in accordance with state law (File No. A13-0007).
- **November 12, 2013:** The General Plan Land Use Designation was amended from Commercial (C) to Multi-Family Residential (MFR) for a proposed multi-family development project in the Pollock Pines area (File No. A13-0006).
- **December 3, 2013:** The General Plan Land Use Designation was amended from High Density Residential (HDR) to Commercial (C) to allow for the development of a 2,432 square foot market/deli and outdoor picnic area in the Latrobe area (File No. A13-0001).

8. *Priorities for land use decision making established by the Board of Supervisors*

The El Dorado County General Plan provides direction to monitor growth activity, on an annual basis and at five year intervals, and to make necessary adjustments to the development potential of the plan. On April 4, 2011, during the first five-year review cycle, the County assessed prior activity and determined that the basic General Plan Assumptions, Strategies, Concepts and Objectives were still generally valid, and that major adjustments would not be needed at this time. The Board further identified goals for the 2011-2016 planning cycle to better address certain land use decision making priorities including: 1) Development of housing affordable to moderate income households, 2) Creation of jobs, 3) Retention of sales tax revenue in the County, and 4) To further promote and protect agriculture and natural resource industries.

9. ***Goal, policies, objectives, standards or other place proposals that need to be added or were deleted, amended, or otherwise adjusted.***

Selected General Plan policy amendments were initiated in calendar year 2011 and are currently in process as part of the Targeted General Plan Amendment-Zoning Ordinance Update (TGPA-ZOU). More detailed information is discussed in the Executive Summary in this report. The current status of the TGPA-ZOU is available online at:

http://www.edcgov.us/Government/LongRangePlanning/LandUse/TGPA-ZOU_Main.aspx

10. ***One or more lists of the following, including reference to the specific General Plan element or policy, status (i.e. approved/denied, initiated/ongoing/ completed, etc.) and brief comment on how each advanced the implementation of the General Plan during the past year: a) Planned activities initiated, b) General Plan Amendments, c) Major development applications processed.***

A list of Implementation Measures by Element, including Mitigation Measures from the adopted Mitigation Monitoring Program, has been provided along with the status of each measure for calendar year 2013, and is included as Appendix A. Planned activities initiated, General Plan Amendments, and major development applications processed during the calendar year 2013 are included in Section 5 (Planning and Development Activities) of this report.

11. ***Additional Useful Content Relevant to General Plan Implementation or Long-Range Planning Efforts: OPR recommends that jurisdictions augment the above content by submitting additional information such as long-term planning projects, actions or measures relevant to that jurisdiction's long-term strategic plan.***

    Discussions of the County's long-term planning projects, measures and General Plan implementation actions are included under the appropriate sections of this report.

General Plan Elements

Below is a summary of each element included in the County's General Plan.

Land Use Element

The Land Use Element sets forth specific goals, objectives, policies and maps to guide the intensity, location and distribution of land uses. This element highlights planning strategies to produce a land development pattern supporting several key principles: 1) to make the most efficient and feasible use of existing infrastructure and public services, 2) to provide for new and existing development that promotes a sense of community, 3) to define those characteristics which make the County "rural" and provide strategies for preserving these characteristics, 4) to provide opportunities for positive economic growth in such areas including employment, tourism, increased retail sales and high-technology industries and 5) to provide guidelines for new development that maintains and enhances the quality of the County.

The General Plan Land Use Diagram (Land Use Map) is a graphic representation, or picture, of the County's goals, objectives and policies. The General Plan land use map delineates areas where future lower-density rural and agricultural uses are likely to continue and/or expand as well as regions where higher density growth and urban/suburban like activities are anticipated and/or will be directed.

The General Plan land use map contains three primary regions for directing various types of land uses: 1) Community Regions, bounded by an urban limit line demarcating where urban and suburban uses will be developed; 2) Rural Centers, also bounded by a similar limit line, to recognize existing defined places which provide a focus of activity and provide goods and services to surrounding rural areas; and 3) Rural Regions, which are lands not contained within the boundaries of Community Regions or Rural Centers. Rural Regions provide a land use pattern that maintains the open character of the County, preserves its natural resources, recognizes the constraints of the land and infrastructure and preserves outlying agricultural and forest/timber resources for future generations.

Under the Land Use Element, an important component of the County's strategic plan for General Plan implementation also includes an annual monitoring of "useful" growth indicators during the previous calendar year (General Plan Policies 2.9.1.1 and 2.9.1.6) including: a) population growth; b) employment capacity; c) land development activity; d) new housing starts; and e) availability of future housing.

The results of this annual monitoring can then be analyzed to determine if housing and commercial inventory is adequate to meet General Plan goals and objectives. General Plan parcel monitoring includes tracking the number of residential parcels approved since 1999. Based on the results of regular monitoring since 1999, nearly all home construction in El Dorado County can be derived from one of the following:

1. "Existing Commitments" in place as of 1999, including Specific Plans and Development Agreements for the creation of new lots;
2. Developments for which a Tentative Subdivision or Parcel Map had been approved prior to 1999;
3. Building permits issued before 1999; and
4. Legal lots existing prior to 1999.

Regular monitoring has found the following:

1. As of calendar year 2013, no new Specific Plans (SP) had been approved since before 1999;
2. Less than 1,000 new tentative residential lots ("commitments") have been approved countywide outside of SP areas since adoption of the General Plan. Out of the 1,000 lots, less than 200 new residential parcels were created between January 1999 through December 2013.

3. During the monitoring period from 1999 – 2013, there has been significant growth in various sectors of commercial, non-residential development including the following:

    - 2,436 Building Permits (with new square footage);
    - 7,253,184 square feet (new employment capacity);
    - An estimated total of 15,293 new jobs in the following economic sectors[1]:
        - Education: 195 jobs;
        - Office: 7,765 jobs;
        - Retail: 2,288 jobs;
        - Service: 1,946 jobs;
        - Medical: 404 jobs; and
        - Industrial[2] 2,695 jobs.

[1] Sources: SACOG, 2001; County of El Dorado, 2013; SACOG, 2013; BAE, 2013.

[2] Industrial jobs estimate also includes warehouse and "shell" building permits.

As directed by General Plan Policies 2.9.1.2, 2.9.1.3 and 2.9.1.4, during the five year review, if the monitoring results indicate that the distribution of growth varies significantly from the major assumptions of the General Plan, the County may make appropriate adjustments to the Plan's development potential, including:

1. Increasing or decreasing the capacity of one or more housing types (e.g. more multi-family vs. single-family; replacement of apartment lands with small lot single-family developments, etc.);

2. Changing the distribution of projected growth, including the adjustment of Community Region and Rural Center boundaries; and

3. Prioritizing infrastructure expenditures such as road improvements to direct new growth into opportunity areas.

A review of historic and forecasted population growth, new housing starts, the forecasted housing supply, and commercial square footage (employment capacity) is found in Appendix C.

During 2013, the County continued to make significant progress with implementation of the Land Use Element. The primary projects associated with implementing the planning principles of the Land Use Element are described below.

Zoning Ordinance Update (2011-Present)

Beginning on April 4, 2011, the Board of Supervisors initiated the process for a comprehensive Zoning Ordinance update in conjunction with several targeted General Plan Amendments, collectively known as the "TGPA-ZOU" project. The Zoning Ordinance update is the first comprehensive update to the Zoning Ordinance in over 30 years. The primary purposes of this update are to bring zoning regulations into conformance with the General Plan, and other State regulations, and to enhance the economic development of the County (General Plan Implementation Measures LU-A, LU-C, LU-D and LU-G). A detailed status review of applicable land use measures is shown in Appendix A.

In October 2013, the Board authorized the preparation of the Draft Environmental Impact Report (DEIR). The DEIR was released in early 2014 and the final EIR is anticipated to be completed by October 2014.

Land Development Manual Update (2010-Present)

Land Use Implementation Measure LU-E requires that the Department of Transportation and Planning Department "review and identify needed revisions to the County of El Dorado Design and Improvements Standards Manual" (DISM). The Development Services, Transportation and Environmental Management Divisions of the Community Development Agency, in conjunction with the County Surveyor's Office, the Community Economic Development Advisory Committee, and local fire district personnel, are creating a Land Development Manual (LDM), intended to replace the current Design and Improvement Standards Manual (DISM). The new LDM document is anticipated to be completed in 2015.

Meyers Community Plan Update (2012-Present)

General Plan Goal 2.10 and General Plan Implementation Measure LU-O direct the County "to coordinate the County's land use planning efforts in the Tahoe Basin with those of the Tahoe Regional Planning Agency" (TRPA).

In December 2012, TRPA updated its 25-year old 1987 Regional Plan. One of the goals of the TRPA Regional Plan Update (RPU) was to allow for local jurisdictions to act as the primary land use and permitting authority within specific areas of the Tahoe Basin. In conformity with the RPU, new Area Plans adopted after 2012 would provide more specific development objectives and standards that are adapted to the needs of each specified area with emphasis in overdeveloped areas of the region that were formerly designated as community plan areas.

In May 2012, an update to the 1993 Meyers Community Plan (MCP) was initiated, as the MCP was over 20 years old and had only minor changes since adoption. In addition to conforming the existing MCP to the 2012 TRPA Regional Plan Update, the updated MCP would provide incentives needed to: 1) encourage transfer of existing development to areas of lower environmental sensitivity, 2) concentrate land uses within less-sensitive areas, 3) rehabilitate and redevelop aging infrastructure, and 4) enhance environmental protections.

Most importantly, the new MCP will provide a planning tool to implement the Meyers community's vision, recognize the unique characteristics of the community and streamline the land development process for the community of Meyers. Finalization of the plan is anticipated by late 2014.

Transportation and Circulation Element

The Transportation and Circulation Element provides the framework for decisions in El Dorado County concerning the countywide transportation system. The system includes facilities for various transportation modes, including roads, transit, non-motorized and aviation. This element provides for coordination with the incorporated cities within the county, the El Dorado County Transportation Commission, the Sacramento Area Council of Governments, the Tahoe Regional Planning Agency, and state and federal agencies that fund and manage the county's transportation facilities. The Transportation and Circulation Element reflects the urban and rural diversity of the unincorporated areas of El Dorado County and establishes standards that guide development of the transportation system, including access to the road and highway system required by new development.

During 2013, the County continued to implement planning efforts to facilitate a safe, multi-modal road and trail network. The 2013 Capital Improvement Program (CIP) was adopted on June 24, 2013. The new Travel Demand Model (TDM) was completed in 2013. The TDM relies on existing base data (traffic counts, existing development, 2010 Census information, and the County's roadway network). It also includes a forecast of the distribution and timing of future growth within the General Plan horizon (year 2035). A peer review of the model was completed in May 2013. In June 2013, the TDM data (2010 Baseline and Draft 2035 Land use Forecast) was released to run forecast scenarios. A growth forecast was approved by the Board of Supervisors in April 2014, as the starting point for initiating the 5-year major CIP and Traffic Impact Mitigation (TIM) Fee Program updates, anticipated to be completed by late 2015.

Housing Element

The State of California identifies provision of adequate and affordable housing for every Californian as a statewide goal. This Housing Element must meet the requirements of California Government Code Sections 65583 and 65584, which require local governments to adequately plan to meet the existing and projected housing needs of all economic segments of the county. State law requires the Housing Element to contain a program which sets forth a five-year schedule of actions of the local government to implement the goals and objectives of the Housing Element. With the passage of Senate Bill 375 in 2008, Housing Element Law under Government Code Section 65588 was modified to align that time period to eight years for those governments who are located within a region covered by a regional transportation planning agency, such as the Sacramento Area Council of Governments (SACOG). Therefore, from the date of state certification in November, 2013, the County's Housing Element is valid for the planning period from 2013 to 2021. The County's progress in meeting Housing Element goals is addressed in the County's 2013 Housing

Element Implementation Annual Progress Report, which is included as Appendix B. This report provides details on the County's progress in meeting regional housing needs, as well as removing governmental constraints to the development of affordable housing.

Public Services and Utilities Element

Although the Public Services and Utilities Element is not required by State law, the subjects addressed here are critical to the County's future growth and development. Many of the public services are currently operating close to or exceeding capacity level. The purpose of the Public Services and Utilities Element is to promote a pattern of development which maximizes the use of existing services while minimizing the costs of providing new facilities and services. While implementation of the Public Services and Utilities Element has largely been completed prior to calendar year 2013, several implementation measures are still in progress as of the date of this report. A detailed status review of each measure is shown in Appendix A.

Public Health, Safety and Noise Element

The overall focus of the Public Health, Safety, and Noise Element is to provide guidelines for protecting El Dorado County residents and visitors from existing and potential health, safety or noise hazards in El Dorado County. This Element is consistent with the requirements set forth in the California Government Code Section 65302 and other applicable sections. Specifically, California Government Code Section 65302(g) requires communities to identify "any reasonable risk associated with the effects of seismically induced surface rupture, ground shaking, ground failure, tsunami, seiches, and dam failure; slope instability leading to mudslides and landslides, subsidence and other geologic hazards known to the legislative body; flooding; and wildland and urban fires."

The Public Health, Safety, and Noise Element addresses community noise limitations, in accordance with Government Code Section 65302(f). Additionally, this element satisfies the State mandated requirements for the safety General Plan element.

Although implementation of the Public Health, Safety and Noise Element has largely been completed, several noise-related implementation measures remain incomplete. As comprehensive noise regulations have been incorporated into the Zoning Ordinance Update (ZOU), most of the noise-related measures will be fully implemented upon completion of the ZOU, scheduled for completion in October 2014.

Conservation and Open Space Element

The purpose of the Conservation and Open Space Element of the General Plan is to address the management, preservation, and conservation of natural resources and open space of El Dorado County. Management of the County's resources will assure the availability of those resources to future generations and the realization of their full economic potential. Pursuant to Government Code Section 65302, both a conservation and an open space element must be included in a General Plan. The General Plan combines these two elements into the Conservation and Open Space Element and as such satisfies the legal requirements for the Conservation and Open Space Elements defined in the Government Code, Sections 65302(d) and 65560, respectively.

During 2013, the County continued to make progress with implementing many measures associated with the Conservation and Open Space Element, although much implementation still remains incomplete. A detailed status review of all implementation measures within this Element is provided in Appendix A. One of the primary projects associated with implementing the Conservation and Open Space Element is the Oak Woodlands/Biological Resource Policy Updates described below.

Oak Woodlands/Biological Resource Policy Updates (2008-Present)

On May 6, 2008, the Board of Supervisors adopted the Oak Woodland Management Plan (OWMP) and its implementing ordinance, to be codified as Chapter 17.73 of the County Code (Ord. 4771. May 6, 2008). The primary purpose of this plan was to implement the Option B provisions of Policy 7.4.4.4 and Measure CO-P. These provisions established an Oak Conservation In-Lieu Fee for the purchase of conservation easements for oak woodland in areas identified as Priority Conservation Areas.

A lawsuit was filed in El Dorado Superior Court on June 6, 2008 against the Oak Woodland Management Plan. On February 2, 2010, the Court ruled to uphold the Board's action to adopt the Plan. However, on appeal, the Appellate Court over-ruled that decision, remanding the case back to Superior Court, with the direction to require the County to prepare an Environmental Impact Report for the OWMP. The OWMP was rescinded on September 4, 2012 (Resolution 123-2012) and its implementing ordinance was rescinded on September 11, 2012 (Ord. No. 4892). For the time being, only Option A of Policy 7.4.4.4 is available to mitigate impacts to oak woodlands.

On September 24, 2012, the Board of Supervisors directed the Development Services Department to prepare a General Plan amendment to amend (biological resource) Policies 7.4.2.8, 7.4.2.9, 7.4.4.4, 7.4.4.5, 7.4.5.1, and 7.4.5.2 and their related implementation measures to clarify and refine the County's policies regarding oak tree protection as well as (biological) habitat preservation. The Board further directed staff to prepare a Request for Proposals to hire a consultant to assist the County in preparing the biological policy amendments and an Environmental Impact Report (EIR).

On October 30, 2013, the Community Development Agency (CDA) conducted a Statement of Qualification (SOQ) solicitation for consultants who could provide professional services to the County necessary to consider appropriate amendments to General Plan biological policies. The County received 5 responses to the SOQ. Staff reviewed and ranked all responses received. The top 2 consultants were then interviewed by staff. As a result of this process, Dudek, an environmental consulting firm, was identified as the consultant most qualified to provide the requested services.

On March 11, 2014, the Board of Supervisors approved an agreement for services with Dudek to review the biological resource policies and implementation measures within County's General Plan and prepare an EIR.

Agriculture and Forestry Element

The Agriculture and Forestry Element addresses the conservation, management, and utilization of the County's agricultural and forest lands. Prudent management of the County's agriculture and forestry resources is needed to provide future generations with opportunities to experience both the economic benefits and rural lifestyle residents now enjoy. This current management strategy involves maintenance of large parcel sizes and the minimization of incompatible land use encroachment into these resource rich lands. The County's Implementation Plan for the Agriculture and Forestry Element is fully consistent with the requirements set forth in State law regarding the following:

1. Distribution, location and use of agricultural lands;
2. Conservation, development and utilization of natural resources; and
3. Creating and maintaining open space for managed production of agricultural resources.

During calendar year 2013, progress continued with the implementation of this Element. However, out of twelve required implementation measures, only three measures have been fully implemented, seven implementation measures were in various stages of progress and two measures remained unaddressed. A detailed status review of all implementation measures within this Element is provided in Appendix A. During 2013, key planning efforts to implement this Element included the item(s) below:

Expansion of Agricultural Districts (2009-Present)

Land Use Implementation Measure AF-J requires the completion of an inventory of agricultural lands in active production and/or lands determined by the Agricultural Commission to be suitable for agricultural production with the intent of adding these lands to the existing Agricultural Districts. The El Dorado County General Plan established Agricultural Districts to conserve, protect, and promote agricultural use. Within these districts are buffering protections, parcel size restrictions and policies supporting agricultural development. In July of 2009, the Agricultural Department began an inventory of parcels in close proximity to the existing Agricultural Districts and analyzed those parcels using the following criteria: General Plan land use designations, parcel size, soil type, elevation, present land use, current Williamson Act contracts, and slope. Between July of 2009 and June of 2010, the Agricultural Commission notified over 580 property owners and held 10 public meetings to address the 17,000 acres of proposed additions. This analysis was received by the Board of Supervisors through a Resolution in January of 2011, which directed the Development Services Department to proceed with the recommendations of the Agricultural Commission and prepare a draft revision to the Agricultural District boundaries. This revision has been incorporated into the Targeted General Plan Amendment/Zoning Ordinance Update (TGPA-ZOU) project, which is anticipated to be completed in October 2014.

Parks and Recreation Element

The Parks and Recreation Element establishes goals and policies that address the long range provision and maintenance of parks and recreation facilities needed to improve the quality of life of existing and future El Dorado County residents. The overall focus of the Parks and Recreation Element is on providing recreational opportunities and facilities on a regional scale, including trails and waterways; securing adequate funding sources; and increasing tourism and recreation-based businesses. The element also addresses the location, demand, management, and provision of parks and recreation facilities. For calendar year 2013, only two measures remained unaddressed. Eight measures have been completed and four are in various stages of progress. The status of each of the measures is included in Appendix A.

Economic Development Element

Although an economic development element is not a required element under State law, California Planning law states that “the General Plan may include any element(s) or address any . . . subject(s) which . . . relate to the physical development of the county (Government Code Section 65303).” The Economic Development Element has been included as part of the County’s General Plan in order to strengthen community development activities, enhance economic growth and reinforce the planning process as a positive part of economic development. In addition, this Element seeks to improve a local business climate by recognizing sub-regional constraints and opportunities, expanding the local tax base and enhancing employment opportunities throughout the County.

Economic Development accomplishments during 2013 are highlighted below:

- Implemented CEDAC recommendations for:
  - Development of El Dorado County Web Portal
  - Micro-grant program for community non-profits
  - Grant Consultant to assist non-profits to pursue additional funding
  - Community Vision and Identity Meetings
  - Targeted General Plan Amendment and Zoning Ordinance Update
- Collaborated with Community Development Agency to assist applicants
- Created Economic Development Incentive Policy J-7 (Feb, 2014)
- Awarded CDBG funding to provide financial and technical assistance to small businesses
- Contracted with Buxton to provide consumer analytics to local businesses
- Funded and collaborated with local Chambers of Commerce on annual Business Walks
- Partnered with Connections/HHSA to place unemployed into on-the-job training (OJT)

4. STRATEGIC PLAN FOR GENERAL PLAN IMPLEMENTATION

The Board of Supervisors adopted a (Strategic) Implementation Plan as part of the 2004 General Plan. The implementation Plan includes County activities, processes, reports, programs, assessments, plans and timeframes that are necessary to achieve the General Plan's goals and policies. Each General Plan policy includes one or more implementation measures or programs as a mechanism for its implementation.

As part of the General Plan implementation process, the County is also required by State law to implement a Mitigation Monitoring Program, or MMP. The MMP is a valuable tool to regularly review and assess the progress of specific mitigation measures incorporated into the General Plan to reduce environmental damage (*PRC Sections 21081.6 and 21081.6(b), Government Code Section 65400 and CEQA Guidelines Sections 15091.d and 15097, 15097(b)]*. In addition to State requirements, the General Plan also requires regular reviews of these same (environmental) mitigation measures (General Plan Policy 2.9.1.5). As all mitigation measures have been incorporated into the Implementation Plan, the General Plan is deemed "self-mitigating." Therefore, all mitigation measures are included on the Implementation Plan, with the status of many implementation measures directly affecting the completion of the MMP (See Appendix A).

In November, 2013, the Housing section of the Implementation Plan was amended with the Housing Element update. The amended Implementation Plan for the Housing Element is located on the County web site at:
http://www.edcgov.us/Government/LongRangePlanning/LandUse/SupportingDocuments/2013-21_HousingElement_adopted_10-29-2013.aspx

The (Strategic) Implementation Plan for the other ten Elements is provided as Appendix A. The Implementation Plan is organized into eight categories, grouped by Element including the Land Use, Transportation and Circulation, Housing, Health/Safety and Noise, Conservation and Open Space, Agriculture and Forestry, Parks and Recreation and Economic Development Elements. Each category provides program-level strategies to implement each Element. Within each Element category, specific implementation measures are described, along with references to the General Plan Policies supporting each individual measure. In many cases, implementation measures may implement multiple General Plan policies. In some instances, changes to the Zoning Ordinance or other County codes may be necessary before additional progress can be made to accomplish implementation actions. One example is the requirement to comprehensively regulate noise by adopting a Noise Ordinance (Measure HS-I) where revisions to the existing Zoning Ordinance (or a new Noise Ordinance) are necessary in order to limit noise-generating activities.

5. PLANNING AND DEVELOPMENT ACTIVITIES

Other planning and development activities in 2013 included two General Plan Amendments, several Zoning Ordinance Amendments, and eighty Discretionary Development Applications were approved.

General Plan Amendments

The County General Plan was written as a macro-level document, which also includes more specific portions, such as the Land Use Diagram ("Map"). As such, some new development projects that do not conform to the General Plan are able to request General Plan Amendments ("GPAs") that might alter specific aspects of the General Plan when such a change is found to be consistent with the General Plan strategies and objectives.

Completed in 2013

Two privately-initiated GPAs were approved during calendar year 2013:

Wood Multi-Family Project (File No. A13-0006)

On November 12, 2013, the General Plan Land Use Designation was amended from Commercial (C) to Multi-Family Residential (MFR) for a proposed multi-family development project in the Pollock Pines area.

Latrobe Market (File No. A13-0001)

On December 3, 2013, the General Plan Land Use Designation was amended from High Density Residential (HDR) to Commercial (C) to allow for the development of a 2,432 square foot market/deli and outdoor picnic area in the Latrobe area.

Zoning Ordinance Amendments

The Zoning Ordinance is the primary tool for administering the General Plan. While the General Plan identifies broad land use designations, the Zoning Ordinance identifies parcel-specific uses and development standards. As mandated by the State, the Zoning Ordinance must be consistent with the General Plan. For consistency purposes, changes made to the General Plan may also require a corresponding update to the Zoning Ordinance.

Zoning Ordinance amendments processed by the County in calendar year 2013 are noted below.

Completed in 2013

Four Zoning Ordinance amendments were approved during calendar year 2013:

Privately-Initiated

Wood Multi-Family Rezone (File No. Z13-0003)

On November 12, 2013, the Board of Supervisors adopted Ordinance No. 5003 to rezone an existing mixed-use developed 0.31 acre lot from Commercial (C) to Multifamily Residential (RM) in order to allow future multi-family units. This request was also processed concurrently with General Plan Amendment A13-0006 to amend the General Plan Land Use Designation for this project.

Latrobe Market Rezone (File No. Z13-0001)

On December 3, 2013, the Board of Supervisors adopted Ordinance No. 5004, rezoning an existing parcel from Estate Residential (RE-10) to Commercial (C) to allow for the development of 2,432 square foot market, deli and outdoor picnic area. This request was also processed concurrently with General Plan Amendment A 13-0001 to amend the General Plan land use designation for this project.

<u>County-Initiated</u>

Zoning Ordinance Amendment to Regulate the Distribution of Medical Marijuana (File No. OR 13-0001)

On September 24, 2013, the Board of Supervisors adopted a Zoning Ordinance amendment to regulate the distribution of medical marijuana. The adopted ordinance amended Chapter 17.14.250 of the El Dorado County Ordinance Code prohibiting new medical marijuana distribution facilities, including dispensaries, collectives and cooperatives in all zone districts in the unincorporated areas of the County of El Dorado.

Zoning Ordinance Amendment to Regulate the Outdoor Cultivation of Medical Marijuana (File No. OR 13-0002)

On September 24, 2013, the Board of Supervisors adopted changes to Chapter 17.14.260 of the El Dorado County Ordinance Code, regulating the outdoor cultivation of medical marijuana in all zone districts in the unincorporated areas of the County of El Dorado. The Ordinance regulates the outdoor cultivation of medical marijuana by setting standards and regulations for: the maximum size area for cultivation; screening; security; residency requirements or owner authorization; environmental requirements (water quality, sewage disposal, and use of chemicals); disposal of waste material; collective cultivation on larger lots; abatement and code enforcement; administrative relief provisions and appeal process, including providing for public notice of administrative relief and appeal requests.

In-Process Zoning Ordinance Amendments Submitted in 2013

<u>Privately-Initiated</u>

Serrano Village J5 and J6 (File No. Z13-0002)

The County is currently processing a rezone request for converting an existing five-acre parcel from Planned Commercial-Planned Development (CP-PD) to Single-Family Residential-Planned Development (R1-PD). This request is part of a larger project (File No. TM 13-1511) to create 119 single-family residential lots ranging in size from 6,900 square feet to 14,123 square feet in size.

Cameron Hills Rezone (File No. Z13-0005)

The County is processing a rezone request as a "map clean up" in order to allow proposed revisions to the previously-approved lotting map for TM 08-1473.

FDL Properties Rezone (File No. Z13-0006)

The County is currently processing a rezone request for a single parcel from Planned Agricultural, 20-Acre (PA-20) to Exclusive Agricultural (AE) in order to allow participation in the County's Williamson Act program.

County-Initiated

El Dorado County Zoning Ordinance Update

On November 14, 2011, the Board of Supervisors adopted Resolutions of Intention (183-2011 and 184-2011) to undertake a comprehensive update of the county's zoning ordinance. The update, the first in over 30 years, is part of the TGPA-ZOU project and was on-going throughout 2013. As part of this comprehensive update, certain zone districts are proposed to be deleted. Three of the changing zone districts are agricultural. In March of 2012 and again in July of 2013, the County, in conjunction with the El Dorado County Farm Bureau, sent out over 3,000 letters, asking property owners, who met certain criteria, if they preferred agricultural zoning or residential zoning for their parcels. The County received over 700 requests for agricultural zoning. Web-based GIS land use maps showing the parcels that met the criteria for the "Ag Opt-In" letter and showing the parcels requesting agricultural zoning were developed by the County Surveyor's Office. The Board of Supervisors will be making a final determination on zoning changes, as part of the TGPA-ZOU project which is anticipated to be completed in October 2014.

El Dorado County Sign Ordinance Update

In August of 2012, the Board of Supervisors directed staff to contract for the preparation of a comprehensive sign ordinance amendment and the related Environmental Impact Report (EIR). A contract was executed with Pacific Municipal Consultants, Inc. (PMC) in December of 2012. The project was initiated in January of 2013 with a presentation by PMC at a joint meeting of the Board and the Planning Commission. In June of 2013, the Board authorized the Sign Ordinance Public Draft to be released for a 60-day review period. The public draft was released on July 8, 2013 and the public comment period closed on September 10, 2013. Written comments were submitted by forty-two individuals and seven agencies. In December of 2013, staff presented to the Board a general summary of the public comments received and asked the Board for direction on several policy issues identified in the public comments. The Board's direction required revisions to the draft sign ordinance which will be presented to the Board, along with the Notice to Proceed with the EIR, by July of 2014. The final EIR and updated Sign Ordinance are anticipated to be adopted by the Board by the end of 2014.

Withdrawn Zoning Amendments

Privately-Initiated

Promontory Village Lot D1 (File No. Z13-0004)

Rezone request Z13-0004 was withdrawn by the applicant on October 22, 2013, as Planning Services staff deemed that a rezone would not be required based on Sections 6.1, 6.2 and 6.3 of the Promontory Specific Plan, in order to accommodate proposed residential uses.

Discretionary Development Applications

In 2013, eighty (80) discretionary development applications were approved. A condition of approval requires consistency with the General Plan goals and objectives. Table 1 on the next page provides a summary of the total discretionary development applications received by the Development Services Division during calendar year 2013.

Table 1: Summary of Discretionary Development Applications Filed in 2013 [1, 2]

Application Types	Applications Submitted in 2013			
	New Request	Approved	Denied/ Withdrawn	Still in Process
General Plan Amendments (Privately-Initiated)	3	2	1	
Discretionary Certificates of Compliance	2	1		1
Development Agreements	2		1	1
Design Review Permits	5	5		
Tentative Parcel Maps	2	2		
Tentative Subdivision Maps	3	2		1
Special Use Permits	17	9		8
Planned Developments	5	3	1	1
Specific Plans	3			3
Rezones	6	1	1	4
Variances	3	3		
Temporary Use Permits	39	37	1	1
Williamson Act Contracts	11	2		9
Pre-Applications	14	13		1
TOTALS	114	80	5	29

Notes:

1. Table only identifies applications initiated in 2013.
2. County-initiated projects [("Gov") files, County-initiated General Plan Policy Amendments, Zoning Ordinance revisions] and administrative projects [Lot Line Adjustments and Site Plan Reviews] are not included.

6. OTHER RELATED ACTIVITIES

A. Review of: Interagency or intergovernmental coordination efforts and identify areas for improvement. This may include participation in a regional blueprint or partnerships with State or Federal programs.

The County continues ongoing discussions with City of Placerville regarding coordinating City/County housing programs and other various opportunities to streamline delivery of public services and programs. The County coordinates on a monthly basis with the El Dorado County Transportation Commission (EDCTC) by participation on the EDCTC's Technical Advisory Committee (TAC). EDCTC is the Regional Transportation Planning Agency (RTPA) for the County and the City of Placerville. The County also coordinates with the Sacramento Area Council of Governments (SACOG) by participating in monthly meetings of SACOG's Regional Planning Partnership and Planners Committee. SACOG is the federally mandated Metropolitan Planning Organization (MPO) for six counties and 22 cities in the Greater Sacramento region. Coordination efforts include providing input in the updates to the region's long-range Metropolitan Transportation Plan/Sustainable Communities Strategy, the distribution of affordable housing in the region, Regional Housing Needs Assessment (RHNA), planning efforts related to land use, transportation, and air quality. Coordination efforts with the Tahoe Regional Planning Agency (TRPA) are also ongoing. In an effort to improve interagency coordination with TRPA, the County began planning a joint workshop with TRPA in late 2013. The half-day workshop included face-to-face meetings and presentations by County and TRPA staff on each respective current and long-range planning effort. This special workshop was held in January 2014.

B. Review of: The implementation of mitigation measures from the General Plan Final Environmental Impact Report or Negative Declaration.

The review of the implementation of the mitigation measures is addressed in the "Strategic Plan for General Plan Implementation" section of this report.

C. Summarize efforts to: Promote infill development, reuse, and redevelopment particularly in underserved areas while preserving cultural and historic resources.

An integral part of the Zoning Ordinance Update is the proposed Mixed Used Development Guidelines. A draft Mixed Use Design Manual was released in March 2014 for public review. This guide was developed to provide a framework for good design that promotes economic and cultural revitalization while respecting historical foundations. The Mixed Use Design Guide takes into consideration El Dorado County's historic Gold Rush roots.

D. Summarize efforts to: Encourage efficient development patterns.

The 2004 General Plan includes vision statements, goals and objectives that encourage efficient development patterns. The development of these visions and strategies serves to provide for the underlying approach of the General Plan. This approach is the identification of distinct planning concept areas where growth will be directed as a means of providing for a more manageable land use pattern. The concepts of the Plan also recognize that differing levels of service will occur within community and rural areas.

1. Community Regions where growth will be directed and facilitated;
2. Rural Centers where growth and commercial activities will be directed to serve the larger Rural Regions; and
3. Rural Regions where resource based activities are located will be enhanced while accommodating reasonable growth.

Higher levels of infrastructure and public services of all types shall be provided within Community Regions to minimize the demands on services in Rural Regions. The Capital Improvement Plan for the County and all special districts will prioritize improvements. It is the explicit intent of the Plan, through the appropriate application of these planning concept areas, to: (1) foster a rural quality of life; (2) sustain a quality environment; (3) develop a strong diversified, sustainable local economy; (4) plan land use patterns which will determine the level of public services appropriate to the character, economy, and environment of each region;

and (5) accommodate the County's fair share of the regional growth projections while encouraging those activities that comprise the basis for the County's customs, culture, and economic stability.

In 2013 eighty (80) Discretionary Development Applications (see Table 1) were approved. Conditions of approval require a finding of consistency with General Plan Vision, Goals and Objectives supporting efficient development patterns.

E. Describe the jurisdiction's strategy for: Economic development - Depending on the needs of your jurisdiction, this analysis could include information on the ratio of jobs to dwelling units, tax revenues, demographics, census information, etc.

Under the oversight of the CAO's office, the Office of Economic Development (OED) was created to implement the County's economic development strategy. The OED's mission is to stimulate economic growth in the following areas:

1. Attraction and Retention of Employers;
2. Developing incentives for business expansion;
3. Assist in new business formation; and
4. Workforce development

In calendar year 2013, the OED accomplished several key activities to further the County's economic development goals. These details are discussed in the Economic Development Element section of this report. The 2014 objectives to develop long long-term economic development strategies are summarized below:

1) **Policy Development and Implementation -** Revise and update Incentive Policy; Review and recommend additional policies
2) **Business Retention and Expansion (BRE) -** Industry Sector Committees Business Walks; Face-to-Face Business Visits
3) **Entrepreneurship Development -** CDBG Micro-Enterprise Assistance; SEDCorp Workshops; Outreach to Home-Based Businesses

4) **Collaboration with Workforce Investment Programs -** Identify Businesses' Hiring and Training Needs thru BRE; Create "Learning Linkages" with K-12, Community College, Workforce Investment

5) **Finance Necessary Infrastructure -** Identify State and Federal Economic Development Grant Sources; Replicate Master Circulation and Funding Plan (MC&FP) for Missouri Flat for business parks

6) **Business Attraction and Recruitment**

E. Describe the jurisdiction's strategy for: Monitoring long-term growth - For example: population growth, employment growth, land use development, and the provision of adequate supporting public services and infrastructure.

General Plan Policies 2.9.1.1 and 2.9.1.2 directs that the County shall monitor on an annual basis and every 5 years, the rate at which the land inventory is developed, the population and employment growth of the County, and other useful indicators of the County's growth. If the results of this monitoring process indicate that the distribution of growth varies significantly from the major assumptions of this Plan, the County shall make appropriate adjustments to the Plan's development potential by General Plan amendment.

F. Outline department goals, objectives, and responsibilities, as they relate to land use planning.

In 2013, the County formed a new Long Range Planning team which is responsible for helping the Board of Supervisors develop plans, policies, ordinances and programs. Long range planning involves highly complex and diverse land use and transportation decisions that require a careful balancing of competing economic, social and environmental interests. The Long Range Planning mission is to serve the needs of El Dorado County's current and future residents, businesses and visitors by providing accurate information, impartial analysis and forums for stakeholder discussions to support well-informed long range planning decisions, and facilitating implementation of Board-adopted plans, policies and ordinances.

G. *Review and summarize grant administration for land use planning activities.*

In July 2013, the Board approved a new Cultural and Community Development Grant Program. The purpose of the program is to provide funds to private non-profit and public organizations whose purpose is to promote cultural, historical preservation and other promotional activities, which encourage/enhance tourism, agriculture, and economic development in the County. The notice of funding availability for FY 2013-13 was released on July 19, 2013. Total funding available was $80,000 and the maximum grant amount was $5,000. Twenty-six applications were submitted and 19 were selected for grant awards totaling $79,670. Many of the applications supported General Plan community identification goals and objectives. More information on the Cultural and Community Development Grant Program is available on the County's Economic Development web page:

http://www.edcgov.us/Government/Economic/Cultural_and_Community_Development_Grant_Program.aspx

Also in July 2013, the Board approved the release of a Request for Proposal (RFP) for grant related support services to include funding needs analysis, grant research, grant proposal development, grant administration and reporting, as well as training in preparing comprehensive grant proposals. The RFP specified a broad range of grant opportunities that support funding needs and priorities in a number of areas including: History, Arts and Culture, Public Facilities and Maintenance, Economic Development, Community Planning, Identification and Design, Transportation Infrastructure and Planning, Public Health/Mental Health, Social Services, Law Enforcement, and Technology Development. Five proposals were received and evaluated by a panel of representatives from various County departments and the Community and Economic Development Advisory Committee (CEDAC). The panel interviewed two proposers and selected Grant Management Associates (GMA) and recommended a one year contract be administered by the Economic & Business Relations Manager. The contract was being processed at the end of 2013 and was anticipated to be executed in early 2014. Economic Development funding would only be used for grant related services that support economic development and promotions programs, such as the development of Community Visioning and Implementation Plans.

H. Provide a technology review such as implementation of GIS or establishment of web sites.

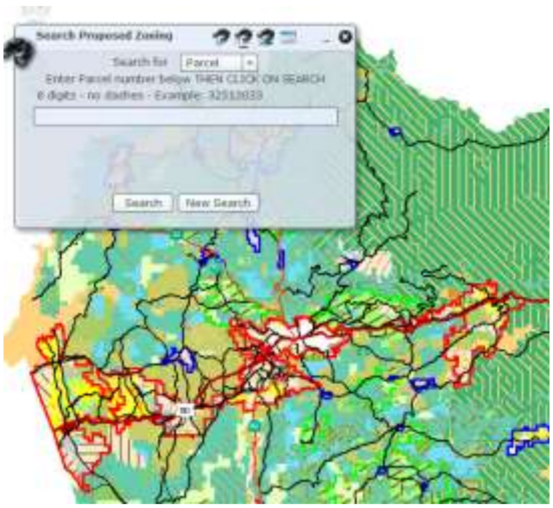
2013 Accomplishments from the County Surveyor's Office and Information Technologies (IT) Departments:

The Geographic Information Systems (GIS) Division of the County Surveyor's Office is responsible for developing, managing and delivering a wide variety of integrated data and GIS maps of parcels, roads and political jurisdictions that support County services and is available to the general public. The GIS Division has done an outstanding job as the interface between the plethora of County data and integrating it with geographical referenced information, and making this information readily accessible and available to County departments and the general public.

In 2013, the GIS Division completed migrating the road network from a shapefile environment to a spatial geo-database. It also completed migrating all separate jurisdiction files such as ZOB, CSA, AOB, Fire, School, Water, City, to a jurisdiction spatial geo-database. These GIS technology upgrades allows the GIS Program to manage single data sources and output multiple and custom views of the data. Some of the GIS Program's accomplishments in 2013 are highlighted below.

A Parcel Inquiry web-based tool was developed that links to a Draft Zoning Map for the Targeted General Plan Amendment-Zoning Ordinance Update (TGPA_ZOU).

Parcel Inquiry	*The Parcel Inquiry links to a Draft Zoning Map for the proposed TGPA-ZOU. After reading the Disclaimer, click on "OK" at the bottom. Then enter your Parcel number in the "Search Proposed Zoning" box, or click on the down arrow for "Search for" and select Address in the drop-down box, and enter your address. Then click on Search.*



The Draft Zoning Map uses a modified version of the parcel base and road data developed and maintained by the County's Surveyor's Office – GIS Division.

The interactive tool allows parcel owners to enter either their parcel number or parcel address that results in a data table which shows the current and proposed zoning for the inquired parcel adjacent to an interactive GIS map of the County that can be moved, expanded and zoomed in and out. The GIS Parcel Inquiry weblink is: http://gemp.edcgov.us/zoning_luppu/

Also for the TGPA-ZOU, various web-based General Plan land use maps were developed and made available to the general public on the County's website at: http://www.edcgov.us/Government/LongRangePlanning/LandUse/TGPA-ZOU_Main.aspx

Other noteworthy GIS activities completed in 2013 include:

- Mixed-use development (MUD) / traditional neighborhood design (TND) permit report on manufacturing/commercial
- GIS layers for Phase II permits for the National Pollutant Discharge Elimination System (NPDES) storm water program for the County's West Slope area
- Development of an interactive web-based map of the County maintained bridges included in the Transportation Division's Capital Improvement Program
- Delivery of a census population density map, and a South County population map

- Review of agricultural parcels
- General Plan Housing Element map of vacant land inventory and Housing Permits for 2013
- GIS verification of the County's Parks and Trail Master Plan
- Geocoding and mapping of business license addresses
- Broadband mapping support
- Special mapping requests for various departments and external agencies (i.e., Specific Plans, Sheriff zones, etc.)

Also in 2013, development of a new Long Range Planning (LRP) web page was initiated. LRP staff coordinated with the County's Information Technologies (IT) Department in designing the layout of the new LRP web pages. Given the constraints of the County's current website structure (which is planned for upgrading in one to two years), the IT staff proposed the use of an "accordion" feature. The new web page, which utilizes the "accordion" feature, was launched in January 2014. It is located on the County's main website: www.edcogov.us under Departments. The direct link to the LRP Home Page is: http://www.edcgov.us/LongRangePlanning/

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
1	In Progress	LU-A	Review the Zoning Ordinance (Title 17 of the El Dorado County Code) to identify revisions that provide consistency with General Plan land use designations and updated development standards.	5.3-1(b), 5.3-3(b)	Viewshed Protection: Protect views from Scenic Corridors, Reduce effects of nighttime outdoor lighting.	Ordinance update in process. Anticipated completion October 2014
2	Completed	LU-B	Incorporate General Plan consistency review for all development proposals and capital improvement projects. [Also refer to Measure LU-C for consistency review of ministerial projects.]	5.1-3(a)	Establish a General Plan conformity review for all development projects	
3	Completed	LU-C	Establish performance standards to be included in the Zoning Ordinance to allow applicants for ministerial projects to demonstrate compliance with General Plan policies and with other applicable County ordinances, policies, and regulations.	5.1-3(a)	Establish a General Plan conformity review for all development projects	See LU-B. General Plan conformity reviews are included as part of in the existing Zoning Ordinance. Standards will also be included as part of the Zoning Ordinance Update.
4	In Progress	LU-D	Revise the Zoning Ordinance to ensure that all uses permitted by right in any zoning district are compatible. Allow potentially incompatible uses subject to a discretionary review process with performance standards	5.1-3(b)	Require development projects to be located and designed in a manner that avoids adjacent incompatible land uses	To be included as part of the Zoning Ordinance Update.
5	In Progress	LU-E	Review and identify needed revisions to the County of El Dorado Design and Improvements Standards Manual.			The Development Services and Transportation Divisions are moving forward with the updating of the county "Design Manual" ("Land Development Manual") with the ongoing main focus of revising the Standard Plans to reflect the new General Plan and current engineering. A secondary effort is the rewriting of the text of the manual to include modifications to the format of the manual and the processes in which the revision and updating will take. Part of interim guidelines and included in proposed Onsite Wastewater Treatment System Ordinance, Complete Streets and mixed use development standards.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
6	In Progress	LU-F1	Create and adopt Community Design Review standards and guidelines and identify new Community Design Review Districts. This would include working with community groups to develop standards. Identify and seat community advisory members within two years of General Plan adoption. Identify community boundaries and create and adopt standards and guidelines within five years of General Plan adoption.			Community Planning initiated in 2011. Framework for communities interested in creating community visions and plans under development.
7	In Progress	LU-F2	See body of LU-F1 above. Identify community boundaries and create and adopt standards and guidelines within five years of General Plan adoption.			Community Planning initiated in 2011. Framework for communities interested in creating community visions and plans under development.
8	In Progress	LU-G1	Establish a Historic Design Review Combining Zone District. Identify suitable areas for application of the district to develop design standards or guidelines for such districts. Begin identification of potential historic districts immediately upon General Plan adoption.			Deferred until after adoption of comprehensive Zoning Ordinance Update.
9	In Progress	LU-G2	See body of LU-G1 above. Prepare and adopt draft ordinance and standards within three years.			Deferred until after adoption of comprehensive Zoning Ordinance Update.
10	Remaining	LU-H1	Develop and implement a program that addresses preservation of community separation, as outlined in Policy 2.5.1.3. The program shall address provisions for a parcel analysis and parcel consolidation/transfer of development rights.	5.1-2	Create distinct community separators	Deferred until after adoption of the TGPA-ZOU.
11	Remaining	LU-H2	See body of LU-H1 above. Complete parcel analysis and make recommendation(s) to the Board of Supervisors within five years of General Plan adoption.	5.1-2	Create distinct community separators	Deferred until after adoption of the TGPA-ZOU.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
12	Remaining	LU-I	Inventory potential scenic corridors and prepare a Scenic Corridor Ordinance, which should include development standards, provisions for avoidance of ridgeline development, and off-premise sign amortization.	5.3-1(b), 5.3-1 (c)	Viewshed Protection: Protect views from Scenic Corridors, Reduce effects of nighttime outdoor lighting, Extend limitations on ridgeline development within scenic corridors or identified viewing locations to include all development.	Deferred until after adoption of comprehensive Zoning Ordinance Update.
13	Remaining	LU-J	If segments of State Route 49 are identified as appropriate for State Scenic Highway status during preparation of the Scenic Corridor Ordinance, prepare documentation in support of having those segments identified as a State Scenic Highway.	5.3-1(d)	Nominate SR 49 for Scenic Highway designation	Deferred until after adoption of comprehensive Zoning Ordinance Update.
14	Completed	LU-K	Develop and maintain an inventory of vacant lands within each Community Region and Rural Center. This would include working with community groups to identify appropriate uses for such parcels, including residential development and establishment of communities			
15	Completed	LU-L1	Develop a program to monitor development, population, and employment trends and to provide periodic updates to the Board of Supervisors. Develop program within three years of General Plan adoption.			Tracking system has been developed and is maintained annually. Information provide to Board with 1- and 5-year GP monitoring reports.
16	Completed	LU-L2	See body of LU-L1 above. Give first report to the Board of Supervisors within five years of General Plan adoption.			General Plan Implementation and EIR Mitigation Monitoring Plan updates to be submitted as part of the 2014 annual report and annually thereafter.
17	Completed	LU-L3	See body of Measure LU-L1 above. Present additional reports to the Board of Supervisors every five years after first report.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
18	Completed	LU-M	Develop a program to monitor General Plan policies and programs and General Plan Environmental Impact Report mitigations. Provide periodic updates to the Board of Supervisors and Planning Commission.			General Plan Implementation and EIR Mitigation Monitoring Plan updates to be submitted as part of next annual report, Spring 2014 and annually thereafter.
19	Completed	LU-N	Develop procedures to be used by applicants to substantiate a request for exemption from General Plan policies due to economic viability.			
20	In Progress	LU-O	Coordinate the following with TRPA and other agencies having land use jurisdiction in the Tahoe Basin: 1) Preparation and adoption of a Community Plan for the Tahoma/Meeks Bay area, 2) Identification of additional affordable housing opportunities, 3) Modification of the County's Zoning Ordinance to be consistent with, or adopt as County Code, the TRPA Code of Ordinances and Plan Area Statements; and 4) Implementation of actions recommended in TRPA's periodic Threshold Evaluation Reports.	5.14-1	Cooperate with the TRPA in the implementation of actions recommended in the (TRPA) Threshold Evaluation Report.	Items 3 and 4 are being reviewed as part of the Zoning Ordinance Update (October 2014).
21	Completed	TC-A	Prepare and adopt a priority list of road and highway improvements for the Capital Improvement Program (CIP) based on a horizon of five years. The Board of Supervisors shall update the CIP every two years, or more frequently			
22	Completed	TC-B	Revise and adopt traffic impact fee program(s) for unincorporated areas of the county and adopt additional funding mechanisms necessary to ensure that improvements contained in the fee programs are fully funded and capable of being implemented concurrently	5.4-1(e)		
23	In Progress	TC-C	Revise and update the Design and Improvement Standards Manual (DISM).			Long Range Planning, Transportation, and Planning Services are currently in process in replacing the DISM with the Land Development Manual and Standards Plans.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
24	Completed	TC-D	Continue to identify and pursue appropriate new funding sources for transportation improvements, road maintenance, and Transportation operations. Grant funds from regional, state, and federal agencies should be pursued and utilized			
25	In Progress	TC-E	Develop and adopt an ordinance to protect rights-of-way for future road improvements from encroachment by new development.			
26	Completed	TC-F	Develop and implement a countywide program to annually monitor county road and state highway segment and intersection conditions to ensure that acceptable Levels of Service are maintained.	5.4-1(c), 5.4-2	Expand list of roadway segments allowed to operate at LOS F.	
27	Remaining	TC-G	Work with the cities of Placerville and South Lake Tahoe to establish a system of designated truck routes through urban areas.			
28	Completed	TC-H	Work with the El Dorado County Transportation Commission, the Tahoe Regional Planning Agency, and transit providers in the county to periodically review and update the short-range transit plans in the county.			
29	Completed	TC-I	Encourage transit providers, the El Dorado County Transportation Commission, the Tahoe Transportation District, and the Tahoe Regional Planning Agency, to prepare, adopt, and implement a long-range strategic transit master plan for the County or sub-areas			
30	Remaining	TC-J	Work with the El Dorado County Transportation Commission, Tahoe Transportation District, the Tahoe Regional Planning Agency, and other agencies to identify right-of-way needs within designated transit corridors and to acquire needed rights-of-way.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
31	Completed	TC-K	Work with the El Dorado County Transportation Commission, Tahoe Transportation District, Tahoe Regional Planning Agency, and Sacramento Area Council of Governments Board to identify and pursue funding for transit.			
32	Completed	TC-L	Develop a funding mechanism that requires new development to pay for additional park-and-ride lots identified by transit providers or Caltrans. Work with transit providers to determine the need for additional or expanded park-and-ride lots			
33	Completed	TC-M1	Update the Bikeway Master Plan, consistent with the Bicycle Transportation Act and in coordination with the El Dorado County Transportation Commission, Sacramento Area Council of Governments, California Transportation Division, Tahoe Regional Planning			The Bicycle Transpiration Plan is typically updated every 5 years. The last update was completed in 2010 and adopted by the Board of Supervisors in November 2010. The next update will be completed in 2015. (AN)
34	Completed	TC-M2	See body of TC-M1 above. Plan Adoption: Second full fiscal year following General Plan adoption.			
35	Completed	TC-N	Continue to identify and pursue appropriate funding sources for bikeway construction. Grant funds from regional, state, and federal agencies should be pursued and utilized when compatible with the General Plan policies and long-term local funding capability			
36	Completed	TC-O	Work with other agencies to provide facilities that help link bicycles to other transportation modes, including provision of bike racks or space on buses and parking or lockers for bicycles at transportation terminals.			
37	Completed	TC-P	Use appropriate zoning in designated rail corridors to ensure preservation of rail facilities for future local rail use.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
38	Remaining	TC-Q	Work with the El Dorado County Transportation Commission, the Sacramento Area Council of Governments, the City of Folsom, and Sacramento Regional Transit to support improvement, development, and expansion of rail service in El Dorado County.			
39	Remaining	TC-R	Participate with the El Dorado County Transportation Commission, the El Dorado County Transit Authority, the Sacramento Area Council of Governments, the City of Folsom, and Sacramento Regional Transit to support the identification of Transit Corridors.			
40	Completed	TC-S	Develop and implement a program to ensure that the concurrency requirements contained in this Transportation and Circulation Element are being enforced.			
41	Completed	TC-T	Develop and adopt a program of guidelines for reimbursement of development for costs associated with construction of regional road improvements.			
42	In Progress	TC-U	Revise the County Design Improvement Standards Manual to allow for narrower streets and roadways. The standards should recognize the need to minimize visual impacts, preserve rural character, and ensure neighborhood quality to the maximum extent possible	5.3-2	Design new streets and improvements to minimize effects on rural character to the extent possible.	Long Range Planning, Transportation, and Planning Services are currently in process in replacing the DISM with the Land Development Manual and Standards Plans.
43	In Progress	TC-V1	Work with Sacramento County and the City of Folsom to identify potential alignments for a new arterial roadway from the west side of El Dorado Hills Business Park to U.S. Highway 50.			
44	Remaining	TC-V2	Implement a growth control mechanism for all new discretionary and ministerial development (which includes approved development that has not yet been built) that would access Latrobe Road or White Rock Road.			A cap has been placed on the El Dorado Hills Business Park to alleviate Level of Service concerns at the Latrobe Road and White Rock Intersections. The TGPA/ZOU EIR will be analyzing existing traffic impacts that will assist in determining possible options allowing for the removal of the employment cap.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
45	Remaining	TC-V3	Identify potential rights-of-way needed for establishment of a frequent transit service operating on exclusive right-of-way to the El Dorado Hills Business Park from residential communities in El Dorado County and from the City of Folsom.	5.4-1(d)	Amend the Circulation Diagram to include a Frequent Transit Service on exclusive right-of-way to the El Dorado Hills Business Park.	A cap has been placed on the El Dorado Hills Business Park to alleviate Level of Service concerns at the Latrobe Road and White Rock Intersection. The TGPA/ZOU EIR will be analyzing existing traffic impacts that will assist in determining possible options allowing for the removal of the employment cap.
46	Remaining	TC-W	Develop a procedure to review truck routes associated with discretionary projects to ensure project-related heavy truck traffic noise impacts are minimized.	5.10-1(b)	Establish truck routes to minimize noise at noise-sensitive land uses.	
47	In Progress	TC-X	Develop and adopt a formal program to review signalized intersections that may benefit from synchronization. Include synchronization of intersections that could benefit in the Capital Improvement Program.	5.11-4	Synchronize Signalized Intersections: Implement Mitigation 5.11-2(f) for the Roadway Constrained 6-Lane "Plus" Alternative.	In 2012, the County applied for and was awarded a federal grant to synchronize three intersections on Green Valley Road at Francisco Dr, El Dorado Hills Blvd and Silva Valley Pkwy. (AN) The TIM Fee program has funding reserved for future implementation for Intelligent Transportation Systems (ITS) improvements.
48	Completed	PS-A	Establish a means, either through formal agreement or through the identification of formal contacts, for various County agencies and departments to communicate with the following non-County public service and utility providers regarding planning for the provisions of services.			This measure is addressed as part of all discretionary and ministerial development applications.
49	Completed	PS-B	Review the County Code to identify revisions that project is consistent with the long range and capital improvement plans of County and other service providers and Require and specify the nature of findings to be made by the approving body that a proposed project meets minimum standards for the provision of emergency services, including emergency water supply and conveyance and emergency access, and emergency service facilities.			
50	Completed	PS-C1	Develop and regularly update an infrastructure fee program.			TIM Fees recently updated consistent with measure; other infrastructure provided by outside agencies. See Measure ED-SS for more information.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
51	Completed	PS-C2	See body of PS-C1 above. Adopt fees within three years of General Plan adoption.			The existing Transportation Impact Mitigation (TIM) fee program is routinely updated on an annual basis.
52	Completed	PS-D	Develop a program to improve and promote appropriate sewage disposal systems in areas that do no have public wastewater disposal service.			Implemented and Ongoing
53	Completed	PS-E	Work with the Water Agency and public water providers to establish a water resources development and management program.			
54	Completed	PS-F	Work with the Water Agency and water service providers to establish a process to review ministerial and discretionary project applications reliant upon surface or groundwater for the ability to be adequately served by the proposed water system.	5.5-3, 5.5-1(b)	Increase the likelihood that groundwater supplies are conserved and physically available to meet the needs of future development. Ensure that surface water supplies are adequate and physically available before any new development occurs.	
55	Remaining	PS-G	Encourage water purveyors to design water supply and infrastructure projects in a manner that avoids or reduces significant environmental impacts to the maximum extent feasible.	5.5-2, 5.5-4	Encourage mitigation of the environmental impact of future water supply and infrastructure projects. Encourage mitigation of the environmental impacts related to future expansion of wastewater treatment capacity.	
56	Completed	PS-H	Develop and implement a water use efficiency program for application to existing and new residential, commercial/industrial, and agricultural water users for those areas not served by a water purveyor with an existing water use efficiency program.	5.5-1 (c), 5.5-7	Support development of water conservation and recycling projects that can help reduce water demand and projected shortages. Encourage use of recycled water in new development served by public wastewater systems.	Water use efficiency is included as part of the California Energy and Plumbing Code.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
57	Completed	PS-I	Work with the Water Agency to develop and implement a program to identify areas having groundwater limitations.			
58	Completed	PS-J	Establish a process to review discretionary permit applications reliant upon any non-public community wastewater treatment system for the ability to be adequately served by the proposed system. Process to include development of wastewater treatment stand alone systems.	5.5-8	Monitor performance of septic systems annually.	An analysis of waste water systems is reviewed by the Environmental Health Unit as part of all discretionary development applications.
59	In Progress	PS-K	Develop and implement a monitoring program for septic systems.	5.5-8	Monitor performance of septic systems annually.	A septic monitoring program is currently under review by the Environmental Management Division.
60	In Progress	PS-L	Develop and implement a countywide drainage management program.			An existing drainage program has been implemented in the Tahoe Basin. West Slope drainage management is to be included as part of the West Slope NPDES Phase II Small MS4 General Permit.
61	Completed	PS-M	Prepare a Construction and Demolition Debris Diversion Ordinance for inclusion in the County Code.	5.6-3	Adopt a Construction and Debris Diversion Ordinance.	
62	In Progress	PS-N	Establish a means, either through formal agreement or through the identification of formal contacts, to coordinate a long-term planning process with private utility providers regarding the location and types of future utility delivery facilities.	5.8-7	Encourage coordination between utilities and school districts	
63	Completed	PS-O	Develop standards for energy-efficient site development and construction.			These standards are included as part of the California Energy Code.
64	Completed	PS-P1	Establish a working group to develop and oversee implementation of minimum countywide standards for emergency response times, emergency access, emergency water supply and conveyance, and staffing ratios.			
65	Completed	PS-P2	See body of PS-P1 above. Meet standard requirements within seven years of General Plan adoption.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
66	Completed	PS-Q	Establish a procedure for and the conditions under which coordination of the planning efforts of the County and the school districts will take place.			
67	In Progress	PS-R	Develop program for attracting a four-year college or university to the county.			
68	In Progress	PS-S	Provide support for the development of a performing arts center.			
69	Completed	PS-T	Compile and make available information regarding typical water demands associated with rural residential development that is dependent upon groundwater. Post information on the County's internet web site and make available in hard copy.			
70	Completed	HS-A	Maintain emergency response procedures and programs, including agreements with other local, state, and federal agencies, to provide coordinated disaster response and programs to inform the public of emergency preparedness and response procedures.			
71	Completed	HS-B	Work with the local Fire Safe Councils, fire protection districts, U.S. Forest Service, and California Department of Forestry and Fire Protection to develop and implement a countywide Wildfire Safety Plan.			
72	Completed	HS-C	Develop a program to collect, maintain, and update geological, seismic, avalanche, and other geological hazard information.			The County Surveyor's office regularly receives natural hazard information from the State OES and related agencies. This information is routinely updated and shared with other agencies as needed.
73	Completed	HS-D	Develop and adopt standards to protect against seismic and geologic hazards.	5.9-2(b)	Require geologic analysis in areas prone to geological or seismic hazards.	Included as part of the California Building Code
74	Completed	HS-E	Adopt a Naturally Occurring Asbestos Disclosure Ordinance that includes the provisions in the policy described in Policy 6.3.1.2.	5.8-9(c)	Provide disclosure of Naturally Occurring Asbestos (NOA) on properties.	COMPLETE. (1) Asbestos disclosure required per EDC Ordinance Chapter 8.44, (2) asbestos reports and records must be transferred during real estate transaction per AQMD Rule 223-2.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
75	Completed	HS-F	Develop a program to track asbestos-related information as it pertains to El Dorado County. Report results to the Board of Supervisors annually.	5.8-9(d)	Conduct annual reporting regarding asbestos.	
76	Completed	HS-G	Adopt California Building Code revisions.			
77	Completed	HS-H	Continue to participate in the Federal Flood Insurance Program, maintain flood hazard maps and other relevant floodplain data made available by other sources, and revise or update this information as new information becomes available.	5.8-6	Prohibit creation of new parcels and development of existing parcels that are entirely within dam failure inundation areas.	Measures have been included in the Flood Damage Prevention Ordinance, adopted September 23, 2008.
78	Remaining	HS-J	Establish a working group to address cross-jurisdictional noise issues.			
79	Completed	HS-L	Update airport master plans and work with appropriate Airport Land Use Commissions to update Comprehensive Land Use Plans to reflect noise levels in the year 2025.	5.10-4	Update Airport Master Plans and Comprehensive Land Use Plans	Completed as part of the Airport Land Use Compatibility Plan, adopted June 28, 2012 and administered by the EDCTC.
80	Completed	HS-M	Maintain and update the Hazardous Waste Management Plan for management of hazardous waste to protect the health, safety, and property of residents and visitors, and to minimize environmental degradation.			The Environmental Management Division operates a hazmat incident response team on a 24/7 basis.
81	Completed	HS-N	Collect and maintain information on sites known, or suspected to be contaminated by hazardous materials. The information shall include current data from the California Department of Toxic Substances Control's Hazardous Waste and Substance	5.8-4	Remediate contamination before construction of new development on suspected contaminated sites.	Updated continuously. Most recently, EM staff updated APN numbers in El Dorado Hills to mirror recent re-numbering.
82	Remaining	HS-O	Develop, implement, and update, as necessary, a plan for the storage, transport, and disposal of hazardous materials used at County-operated facilities.			
83	Completed	HS-P	Enhance and maintain the Air Quality Management District's air quality public education program.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
84	Completed	HS-Q	Develop a program to encourage use of mechanisms to reduce peak hour vehicle trips consistent with Policy 6.7.2.2.	5.4-2	Implement 1996 General Plan Alternative Mitigation Measures 5.4-1(a), 5.4-1(b) or 5.4-1(d).	Ongoing. District developing Electric Vehicle Incentive Program (Drive Clean!) with EDCTC CMAQ and District funds to reduce emissions and peak hour congestion.
85	Completed	HS-R	Identify fleet vehicles that could successfully be replaced with more fuel efficient or alternative fuel vehicles. When those fleet vehicles are due for replacement, thoroughly investigate their replacement with such vehicles.			An alternate fuel vehicle replacement program is ongoing.
86	Completed	HS-S	Develop and implement an incentive program to encourage homeowners to replace high-pollution emitting non-EPA-certified wood stoves.	5.11-2 (e)	Develop incentive program to encourage uses of newer cleaner-burning EPA certified wood stoves.	
87	Completed	HS-T	Adopt and/or update air quality regulations regarding agricultural and fuel reduction burning, construction emissions, mobile source emissions, fugitive dust, and volatile organic emissions.	5.11-1	Use updated recommendations to analyze and mitigate potential air qualify impacts.	
88	Completed	HS-U	Monitor existing, ongoing studies related to effects of air pollution on vegetation.			
89	Completed	HS-V	Amend prescriptive standard for the Fugitive Dust Prevention and Control Plan and Contingent Asbestos Hazard Dust Mitigation Plan.	5.8-9(b)	Strengthen Naturally Occurring Asbestos (NOA) and dust protection standards.	
90	Completed	HS-W1	Survey and prioritize safety improvements on County roads. Develop financing programs for making necessary improvements. Complete survey within three years of General Plan adoption.			The Transportation Division has an annual road safety analysis and financing program in place.
91	Completed	HS-W2	See body of Measure HS-W1 above. Develop financing programs within eight years of General Plan adoption.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
92	In Progress	HS-I	To provide a comprehensive approach to noise control, adopt a Noise Ordinance.	5.10-1(a), 5.10-3	Limit noise-generating construction activities. Protect noise-sensitive land uses from unacceptable noise levels caused by stationary noise sources.	This measure is to be completed as part of the TGPA-ZOU project.
93	In Progress	HS-K	Review the Zoning Ordinance and identify changes that would accomplish the following: an airport combining zone district for each of the Safety Zones as defined in the comprehensive land use plans for each of the County's public airports;			To be included as part of the Zoning Ordinance Update.
94	In Progress	CO-A	Review the Zoning Ordinance to identify revisions that: (A) incorporate tree canopy coverage and preservation standards outlined in Policy 7.4.4.4; (B) identify standards for use of native plants in landscaping; (C) Establish a Historic Design Control Combining Zone District; (D) Develop Buffer standards for new nonmining uses adjacent to existing mining operations; (E) Develop standards for minimizing erosion and sedimentation associated with earthwork and grading.	5.9-4(b), 5.9-6(b), 5.9-6 (c), 5.12-1(b), 5.12-1(g), 5.13-1(d), 5.13-1(e)	Restrict development or disturbance on steep slopes. Establish buffers between new development and mining operations. Require 20-acre minimum parcel sizes. Minimize erosion and maximize retention of natural vegetation. Develop and implement an oak tree preservation ordinance. Define Historic Design Control Districts. Prohibit significant alteration or destruction of NRHP/CRHR-listed properties.	Items B-E have been incorporated into the TGPA-ZOU project. Item A will be under review as part of the 2014 Biological Resource Policy Updates.
95	In Progress	CO-C	In coordination with the Resource Conservation Districts, develop a roadside maintenance program that addresses roadside drainage, the protection of adjacent surface waters, and vegetation control.			
96	Completed	CO-D	Develop an agricultural permit program that includes standards for agricultural operations comparable to those in the Grading Ordinance and that considers other issues important to the protection of agricultural lands.	5.9-4(b)	Apply erosion control measures to agricultural grading.	The Agriculture Department has implemented the Ag Grading Permit process and has required the use of the adopted Best Management Practices (BMPs). The program is working as intended.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
97	Completed	CO-E1	Request that the California Geological Survey conduct a non-metallic mineral survey for the County. Manage resources appropriately given the results of the survey. Request survey by state within two years of General Plan adoption.			Study was completed in 2005
98	Complete	CO-E2	See body of Measure CO-E1 above. Amend General Plan upon completion of survey by state.			
99	Completed	CO-G	Create guidelines for development projects that may affect surface water resources. The guidelines should include: definition(s) of surface water resources; criteria for determining the presence of surface water resources; buffer standards; and mitigation			
100	Completed	CO-H	Prepare and adopt an ordinance revision to permit the use of domestic gray water for irrigation purposes.	5.5-8	Monitor performance of septic systems annually.	This measure is addressed in the 2013 Plumbing Code.
101	Completed	CO-I	Evaluate alternatives to the use of salt for snow removal on County roads.			Research for various alternatives to salt for snow removal is ongoing.
102	Completed	CO-J	Develop and implement a program to perform water quality analysis and monitoring of the County's recreational waters.			
103	In Progress	CO-K	Work cooperatively with the State Department of Fish and Game and U.S. Fish and Wildlife Service to implement the gabbro soils rare plant ecological preserve and recovery program and to develop a long-term preserve strategy.	5.12-2(b)	Establish and manage ecological preserves	Ongoing cooperative effort with Pine Hill Preserve Management Team (local, state & federal).
104	In Progress	CO-L	Develop guidelines for the preparation of biological study reports.			Measure will be under review through the Biological Resources Policy Updates - 2014
105	In Progress	CO-M1	Develop and implement an Integrated Natural Resources Management Program (INRMP) consistent with Policy 7.4.2.8			Measure will be under review through the Biological Resources Policy updates; contract to Board of Supervisors March, 2014
106	In Progress	CO-M2	See body of Measure CO-M1 above. Within three years of General Plan adoption, develop framework for acquisition strategy and monitoring program and begin acquisition.			Measure will be under review through the Biological Resources Policy updates; contract to Board of Supervisors March, 2014

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
107	In Progress	CO-N	Review and update the Important Biological Corridor (-IBC) land use Overlay District.	5.12-3(b)	Apply -IBC Overlay to lands identified as having high wildlife habitat values.	Measure will be under review through the Biological Resources Policy updates; contract to Board of Supervisors March, 2014.
108	In Progress	CO-O	Prepare and adopt a riparian setback ordinance.			Interim guidelines adopted by PC. To be incorporated into Zoning Ordinance Update.
109	In Progress	CO-P	Develop and adopt an Oak Resources Management Plan.	5.12-1(f)	Require mitigation for loss of woodland habitat.	Existing OWMP Rescinded September 4, 2012. New OWMP to be considered as part of the 2014 Biological Resources Policy updates.
110	Remaining	CO-Q	Develop and adopt a Cultural Resources Preservation Ordinance.	5.3-1(c)	Adopt a Cultural Resources Ordinance.	Deferred until after adoption of comprehensive Zoning Ordinance Update.
111	In Progress	CO-R	Maintain a confidential cultural resources database of prehistoric and historic resources, including the location and condition of pioneer cemetery sites. Information may be made available consistent with state and federal law.	5.12-1(d)	Develop and implement an Integrated Natural Resources Management Plan.	An existing cultural resources database is in place. However, an Integrated Natural Resources Management Plan (INRMP) has not yet been developed. Creation of an INRMP will be under review as part of the 2014 Biological Resources Policy updates.
112	Remaining	CO-S	Investigate becoming a Certified Local Government through the State Office of Historic Preservation.			
113	Remaining	CO-T1	Work with the State Department of Parks and Recreation to identify the view shed of Marshall Gold State Historic Park (Coloma) and establish guidelines for development within that view shed. Identify view shed within four years of General Plan adoption.			
114	Remaining	CO-T2	See body of Measure CO-T1 above. Adopt standards within six years of General Plan adoption.			
115	Completed	CO-B	Coordinate with the Resource Conservation Districts to address erosion control issues.			
116	In Progress	CO-U	Fully develop requirements for Biological Studies to be prepared in support of Policy 7.4.1.6. Fully develop guidelines for Important Habitat mitigation. Mitigation proposals are to be included in biological resources studies.	5.12-1(e)	Adopt a No-Net-Loss Policy and Mitigation Program for important habitat.	Included as part of the INRMP. See Measures CO-L and CO-M. Measure will be under review through the 2014 Biological Resources Policy Updates

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
117	In Progress	AF-A	Review the Zoning Ordinance (Title 17 of the El Dorado County Code) to identify revisions that accomplish items A-F	5.2-1 (a - f)	Reduce potential conversion of important farmland, grazing land, land currently in agricultural production or from conflict that may result in cancellation of a Williamson Act Contract.	To be included as part of the Zoning Ordinance Update (ZOU)
118	Completed	AF-B	Develop and implement a procedure for processing requests to apply the Agricultural District (-A) overlay.			Dept. of Agriculture staff utilize a formal procedure for applying the Agricultural District (-A) Overlay to development projects.
119	In Progress	AF-C	Develop and implement a procedure for evaluating the suitability of land for forest production uses, a process to review and update The Procedure for Evaluating the Suitability of Land for Agricultural Use (1993); and to implement recommendations.			Agricultural Department staff is in the process to expand soils of local importance for vineyards used to evaluate parcels. Completion of the process is anticipated by January 2015.
120	In Progress	AF-D	Develop and implement new programs to ensure the long-term conservation, enhancement, and use of viable agricultural lands, including grazing lands.	5.2-2	Limit extent of ranch marketing activities, wineries and other nonagricultural uses within agricultural designations.	The Board adopted one aspect of long term conservation, enhancement and use - the Winery Ordinance. (AF-D to be implemented through the TGPA & ZOU)
121	In Progress	AF-E	Develop and implement a method to identify and officially recognize rangelands currently used for grazing or suitable for sustained grazing of domestic livestock.			Staff have identified 4 criteria to use for analysis - Soil type, slope, current use, parcel size (Through the ZOU, grazing WACs are being rezoned Agricultural Grazing)
122	In Progress	AF-F1	Establish a threshold of significance for the loss of agricultural land, a procedure for evaluating a project's contribution to the loss, and means to mitigate losses so that the established threshold is not exceeded. Establish threshold within five years.	5.2-1 (c)	Identify Acceptable Mitigation for Loss of Agricultural Land.	Measure will be under review through the Biological Resources Policy Updates - 2014
123	Remaining	AF-F2	See body of Measure AF-F1 above. Establish procedure for review and mitigation within eight years of General Plan adoption.	5.2-1 (c)	Identify Acceptable Mitigation for Loss of Agricultural Land.	
124	Completed	AF-G	Develop a procedure for the Agricultural Commission to review and provide recommendations regarding discretionary and capital improvement projects that may affect agricultural, grazing, and forestry lands.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
125	Remaining	AF-H	Develop a program to coordinate with the Water Agency and water purveyors to develop and secure a long-term supply of agricultural water and allocate water from increased efficiencies to agricultural use.			
126	Completed	AF-I	Develop a program to enhance long-term fiscal stability of agricultural operations, including use of conservation easements, Williamson Act contracts, land trusts, and transfer of development rights.	5.2-2	Limit extent of ranch marketing activities, wineries and other nonagricultural uses within agricultural designations.	The County has developed several programs to enhance the long term fiscal stability of agricultural operations, including Williamson Act Contracts. The County is reviewing additional activities and programs for economic enhancement of agricultural operations including conservation easements, land trusts and development right transfers.
127	In Progress	AF-J	Complete an inventory of agricultural lands in active production and/or lands determined by the Agricultural Commission to be suitable for agricultural production. Following inventory, perform suitability review and amend Agricultural District boundaries.	5.2-3	Incorporate productive and suitable agricultural land into Agricultural Districts.	The Agricultural District analysis and expansion is part of the TGPA-ZOU project.
128	In Progress	AF-K	Develop Agricultural Best Management Practices (BMPs) for adoption by the Board of Supervisors and use by agricultural operations in complying with General Plan policies 7.1.2.1, 7.1.2.7, 7.3.3.4, and 7.4.2.2.	5.9-4(c), 5.12-4(b)	Apply erosion control measures to agricultural grading. Implement multiple Policies to reduce impacts on sensitive habitats.	Agricultural Best Management Practices (BMP's) have been completed with approximately 20 BMP's posted on the Agricultural Department website.
129	Completed	PR-A	Prepare and implement a Parks Master Plan and Parks and Recreation Capital Improvement Program.			A final Parks and Trails Master Plan and CIP was approved on March 27, 2012
130	In Progress	PR-B	Develop and implement a program to identify and pursue alternative methods to fund and/or support the acquisition and operation of parks and recreation facilities, including raw land.			Alternate funding programs for park acquisition and operations are being developed.
131	Completed	PR-C	Update the Bikeway Master Plan and Hiking and Equestrian Trails Master Plan. Both plans shall contain provisions for regular plan monitoring and updating.			A hiking and equestrian trails plan was approved as part of the completed Parks and Trails Master Plan, approved on March 27, 2012.
132	Remaining	PR-D	Plan for and develop interpretive centers for historical trails and sites.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
133	Completed	PR-E	Maintain and implement the El Dorado County River Management Plan (Environmental Stewardship & Planning 2001) for management of recreational activities on the South Fork of the American River.			A River Management Plan has been developed for the South Fork American River.
134	Completed	PR-F	Develop a program to facilitate the formation of independent recreation districts.			
135	Completed	PR-G	Work with independent recreation districts to support efforts to provide parks and recreation facilities.			Coordination between EDHSCD, CPCSD & GDRD on going as part of subdivision review process
136	In Progress	PR-H	Develop and implement a parks and recreation fee program that addresses the following: A. For projects subject to Quimby Act requirements; B. For projects not subject to Quimby Act; C. Coordination with local parks and recreation providers	5.7-5	Provide funding mechanisms for new park development.	This is included in the Master Plan. A Nexus study has been included in the current budget but a contract has not been executed.
137	Completed	PR-I	Develop and implement a program to encourage major recreational event sponsors to hold events in El Dorado County.			El Dorado County Board of Supervisors created the Economic Development/Parks Division of the Chief Administrative Office in 2013. The Park Division is working with Economic Development to increase recreational tourism to the County. The County has partnered with the City of South Lake Tahoe to develop a Master Plan for the East Slope of El Dorado County which is also focused on tourism.
138	In Progress	PR-J1	Establish a working group or formal contacts to coordinate the actions of resource-based recreation providers in the county, including the Airports, Parks and Grounds of the County General Services Department.			The County is in the process of establishing a working group of resource-based recreation providers to address planning and project review issues.
139	In Progress	PR-J2	See body of PR-J1 above. Develop plan to address planning and project review within three years thereafter. Coordination will be ongoing.			The County is in the process of establishing a working group of resource-based recreation providers to address planning and project review issues.
140	Completed	PR-K	Identify federal and state lands that could be transferred to County ownership and develop a program to facilitate said transfer.			County accepted an easement from the US Forest Service on the Rubicon Trail August 14, 2012

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
141	Completed	PR-L	Accept private sector donations of land, easements, structures, materials, and funds for the development and maintenance of parks and recreation facilities.			
142	Remaining	PR-M	Identify a suitable location and work with the El Dorado County Fair to move the fairgrounds from its existing site.			
143	Completed	ED- A	Economic Development Providers Network Annual Report: Prepare an action plan to implement the objectives of the Economic Development Element. Prepare an annual report on the status of accomplishment toward the objectives for the past year.			
144	Completed	ED- B	Actively participate in the Economic Development Providers Network.			
145	Completed	ED- C	Sponsor, via the Economic Development Providers Network, seminars and workshops for El Dorado County's businesses, targeted industry organizations, and government decision makers.			
146	Completed	ED- D	Establish and maintain liaison with local and regional business organizations to improve coordination of efforts relating to business issues.			
147	Completed	ED- E	Convene periodic broadly based community forums to discuss El Dorado County's economic issues and concerns in conjunction with business, educational, agricultural, environmental, and other interested organizations.			
148	Completed	ED- F	Work with local businesses to gather feedback from problem solving activities for immediate action and/or inclusion in Annual Economic Plans.			
149	Completed	ED- G	Support County business and local government efforts to develop regional, State, National, and international markets for the County's products, services, and attractors.			

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
150	Completed	ED- H	Through the Economic Development Providers Network, provide periodic training workshops for business and public agency participants to develop understanding of business owners' needs.			
151	Completed	ED- I	Establish regulatory assistance services for the public, including businesses, to clarify government regulatory processes, to assist in coordinating regulatory functions, and to provide information regarding vacant land and facilitate locational assistance			A variety of regulatory assistance services are provided to the public by the Office of Economic Development.
152	Completed	ED- J	As part of the annual budget review process, County departments shall identify potential changes in fees, improved regulatory processes, and appropriate staffing allocations and organization to match forecasted work load which minimize delays			
153	Completed	ED- K	Assess the impact on large and small businesses of regulatory issues and recommend cost saving changes to permit processing procedures.			
154	Completed	ED- L	Provide the Economic Development Providers Network [or subsequent organization] with an opportunity to review, on a periodic basis, County government structure for consistency with efficient and cost effective regulation of business.			
155	Completed	ED- M	Expedite permitting services as an incentive to encourage upgrading of unoccupied developed and underutilized commercial and industrial sites and/or structures. The County should encourage the use of unoccupied developed and/or underutilized County owned			In 2012, the Chief Administrative Office began a program to allowing applicant businesses the opportunity to meet with County permitting agencies in a single time and location, with those agencies expediting permits in significantly shorter time. In February 2014, the BOS adopted policy J-7 making economic development incentives available for businesses expanding in the County.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
156	Completed	ED- N	Review existing County regulations and procedures to eliminate unneeded, inconsistent, and redundant legal requirements.			
157	Completed	ED- O	Use the final Environmental Impact Report (EIR) for the General Plan as a first tier EIR. Future environmental documents for site specific projects, development code regulations, and specific zoning may rely upon and tier off of this EIR.			
158	In Progress	ED- P	Revise the Zoning Ordinance so that classes of permitted uses for commercial, industrial, and research and development uses on lands so designated on the General Plan Land Use Maps, and/or that have been pre-planned through planned developments, specific			To be included as part of the Zoning Ordinance Update.
159	Completed	ED- Q	Regulations shall include a means to accomplish regulatory needs with the least interference and/or barriers to business. Interested parties should be invited to participate in the development and review of new regulations.			
160	In Progress	ED- R	Prepare an overview statement for proposed laws or administrative regulations including: (a) the purpose of the law and/or regulation; and (b) the relationship between stated purposes and other adopted laws and/or regulations of the County.			To be included as part of the Zoning Ordinance Update.
161	Completed	ED- S	All proposed development regulations or ordinances shall demonstrate a public benefit where proposed regulations or ordinances will result in private or public costs.			
162	Completed	ED- T	Assemble and maintain a library of economic data to be available for use in economic impact studies and/or industry case studies.			The Office of Economic Development maintains various sources of economic data available for use in economic impact and/or industry case studies.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
163	Completed	ED- U	Make available to the business community and other community interest groups including individuals, publications on economic and demographic information for El Dorado County's incorporated and unincorporated areas.			The County has developed economic and demographic reports and data for use by local businesses and other interested community groups.
164	Completed	ED- V	Create a Target Industry Committee representing a cross-section of community interests including local business interests to develop selection criteria for determining desirable target industries that are harmonious with the local custom, culture, and over			
165	Completed	ED- W	Prepare a report once every two years which describes the El Dorado County economy, identifies important demographic and industry trends, identifies leading economic indicators, and identifies and ranks targeted industries to help guide business recruitment			
166	Completed	ED- X	Provide information to educate the business community on environmental issues and to educate the environmental community on the local and regional economy.			
167	Completed	ED- Y	Identify environmental issues to be considered by the Economic Development Providers Network.			
168	Completed	ED- Z	Identify and attract selected targeted industries that are consistent with the County's goal of balancing economic vitality and environmental protection.			
169	Completed	ED-AA	Develop an action plan for each targeted industry to encourage retention and expansion of businesses including special needs of each targeted industry and location assistance for expansion or relocation.			The State Employment Development Department (EDD), in partnership with the Office of Economic Development, is developing an updated strategic plan to address special needs of targeted industries within El Dorado County.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
170	Completed	ED-BB	The Economic Development Providers Network shall establish a system for annually inventorying existing industries and businesses in order to provide early warning of businesses that are at risk and are considering moving or expanding out of the County.			The State Employment Development Department (EDD), in partnership with the Office of Economic Development, will meet with private sector employers to identify business climate issues and solutions and assist at-risk businesses.
171	Completed	ED-CC	Annually dedicate and budget County staff to implement programs under General Plan Objective 10.1.5 and/or coordinate County efforts with the private sector and Economic Development Providers Network.			
172	Completed	ED-DD	The County shall monitor land availability through five-year reviews of the General Plan to assure a sufficient supply of commercial and industrial designated lands.			A five-year review was completed in 2011. The next 5-year review is scheduled for completion in 2016.
173	Completed	ED-EE	Develop a comprehensive regional economic development program to attract industry to the County at a rate higher than the Sacramento Area Council of Governments (SACOG) and/or County employment forecasts.			The County has developed a program for business attraction activities including a partnership with the State Employment Development Department (EDD).
174	Completed	ED-FF	The Economic Development Providers Network shall conduct meetings and interviews with existing companies in each of the identified growth industries focusing on service needs and local government's ability to address those needs.			In February, 2014, the Board of Supervisors adopted Policy J-7, outlining several new and existing financial incentives for business expansion in the County, and EDD staff will be scheduling regular meetings with private sector employers to identify business climate issues and solutions.
175	Completed	ED-GG	The Economic Development Providers Network shall conduct economic base studies to identify trends in industry and to identify those industries which are well positioned in the local, regional, State, National, or international markets			The Office of Economic Development oversees a program to conduct economic base studies and identify industry trends.
176	In Progress	ED-HH	Develop an information system on significant potential vacancies in office, commercial, and industrial space to facilitate the movement of business from one facility to another.			Relevant enhancements to the County Economic Development webpage have been planned and budgeted for 2014-2015 fiscal year.

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
177	In Progress	ED-II	The Zoning Ordinance shall provide for agriculture dependent commercial and industrial uses on lands within Rural Regions.			To be completed as part of the Zoning Ordinance Update.
178	In Progress	ED-JJ	The Zoning Ordinance shall allow the sales and marketing of products grown in El Dorado County and crafts made in El Dorado County in areas designated for agricultural use.			To be completed as part of the TGPA-ZOU.
179	In Progress	ED-KK	Designate sufficient lands of a size and at locations to accommodate needed retail and commercial development.			To be completed as part of the TGPA-ZOU.
180	Completed	ED-LL	Annually assign and budget County staff to implement Policy 10.1.6.1 and/or coordinate efforts with the Economic Development Providers Network.			
181	Completed	ED-MM	Work with the cities of Placerville and South Lake Tahoe to establish a uniform small business licensing application, forms, and instructions for all cities and the County.			
182	Completed	ED-NN	Work with the cities of Placerville and South Lake Tahoe to review the business license fees in the cities and County to provide an equitable structure for business with ten or less employees. [Should be completed concurrently with Measure ED-J.]			
183	Completed	ED-OO	Provide information on small business assistance programs, the agencies regulating small businesses, and distribute small business resources directories.			The Office of Economic Development provides a variety of informational tools to assist small businesses.
184	In Progress	ED-PP	Establish land use regulations that permit by right satellite work centers, home work place alternatives, and home occupations as a means of reducing commutes on U.S. Highway 50.			Part of the TGPA-ZOU Project 2014
185	In Progress	ED-QQ	Establish standards in the Zoning Ordinance that provide compatible home businesses that complement residential uses in the Community Regions, Rural Centers, and Rural Regions.			Part of the TGPA-ZOU Project 2014

Appendix A2 - 2013 General Plan Implementation Measures Progress Report

No.	Status	Implementation Measure	Measure Text*	EIR Mitigation Impact Number(s)	Associated Mitigation Requirement(s)* (If any)	Notes
186	Completed	ED-RR	Work with developers of Conditions, Covenants, and Restrictions (CC&Rs) to prevent the creation of CC&Rs that preclude home occupations or work-at-home activities.			
187	Completed	ED-SS	Review existing County impact fees and consider adopting fees necessary to assure that new development pays its fair share of public facility and services costs.			
188	Completed	ED-TT	When a project directly or indirectly affects existing public services and/or infrastructure, it shall provide for and finance improvements consistent with the degree of impact to public services and/or infrastructure directly or indirectly			
189	Completed	ED-UU	As part of its annual review of its Capital Improvement Programs, the County should include a Section 65401 review which lists all capital projects sponsored by other jurisdictions during the following year and makes a finding relative to the consistency			
190	Completed	ED-VV	As part of an effort to maintain high quality services and implement the General Plan, the County should maintain an effective liaison and improve cooperation with the cities and special districts serving the County.

Table C

Program Implementation Status

	Program Description (By Housing Element Program Names)	**Housing Programs Progress Report - Government Code Section 65583.** Describe progress of all programs including local efforts to remove governmental constraints to the maintenance, improvement, and development of housing as identified in the housing element.		
	Name of Program	**Objective**	**Timeframe in H.E.**	**Status of Program Implementation**
1	Review land use patterns	Identify areas for future housing	Ongoing	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
2	Review adequate sites for affordable Housing	Identify areas for future affordable housing without need to fund major infrastructure	One Year	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
3	Review and update Capital Improvement Program	Revised facility plans; extension of services to underserved areas of the County	Annually	Completed and ongoing. Reviewed annually with update of Capital Improvement Program. Carried forward as Measure in 2013-2021 Housing Element Update.
4	Develop incentive based policy for affordable housing development	Provide incentives to encourage development of affordable housing	Two Years	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
5	Track and record second dwelling units and hardship mobile homes	Ensure opportunities to access affordable housing	One Year	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
6	Amend Zoning Ordinance and Design and Improvement Standards Manual	Provide more flexibility for affordable housing	One Year	In Progress. Carried forward as Measure in 2013-2021 Housing Element Update. County has undertaken a Comprehensive Zoning Ordinance Update to address greater flexibility as incentives for the development of housing affordable to very-low to moderate income households.
7	Adopt Density Bonus Ordinance for Affordable Housing	Promote benefits of program to development community	One Year	Completed March 2009
8	Work with Tahoe Regional Planning Agency (TRPA) on Tahoe Regional Plan	Facilitate the construction of more affordable and workforce housing	Ongoing	MOU adopted and County is working to work cooperatively with TRPA and the Meyers Community Advisory Counsel (MCAC), formerly known as the Meyers Roundtable. Carried forward as Measure in 2013-2021 Housing Element Update.
9	Establish a Housing Trust Fund	Establish flexible, locally controlled source of funds dedicated to meeting local affordable housing needs for low income households	Two Years	The County administers a dedicated Predevelopment revolving loan fund for affordable projects with Board approval and also administers a CalHFA Housing Enabled by Local Partnerships (HELP) revolving loan program to assist in the acquisition and construction of affordable housing development. Carried forward as Measure in 2013-2021 Housing Element Update.

ANNUAL ELEMENT PROGRESS REPORT
Housing Element Implementation
(CCR Title 25 §6202)

Jurisdiction County of El Dorado

Reporting Period 1/1/2013 - 12/31/2013

10	Review residential development processing procedures annually	Identify additional opportunities to further streamline the procedures for affordable housing projects while maintaining adequate levels of public review	One Year	Board-appointed Advisory Committee has established a Regulatory Reform Team who meet weekly and report to the Board of Supervisors with recommendations to reduce constraints to affordable housing. Carried forward as Measure in 2013-2021 Housing Element Update.
11	Adopt infill ordinance	Assist developers with incentives to addressing barriers to infill development	Two Years	In progress. Carried forward as Measure in 2013-2021 Housing Element Update.
12	Investigate land banking	Land banking as method to provide sites for affordable housing	Two Years	In progress. Carried forward as Measure in 2013-2021 Housing Element Update.
13	Support a legislative platform for affordable housing	To facilitate the development of affordable housing, especially in the Tahoe Basin	Ongoing	In progress. Carried forward as Measure in 2013-2021 Housing Element Update.
14	Interdepartmental working group	Ensure cooperation between departments, CAO and Board of Supervisors in the implementation of Housing Element	Ongoing	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
15	Track workforce housing	Track the approval and status of employee housing, including farm worker housing	Three Years	Program to track workforce housing in place. Developing method to study agricultural worker housing needs. Carried forward as Measure in 2013-2021 Housing Element Update.
16	Amend the Planned Development combining zone district	Provide adequate developer incentives to encourage inclusion of affordable housing	One Year	Included in Comprehensive Zoning Ordinance Update scheduled for adoption in 2013.
17	Implement First Time Homebuyer program	Continue to apply for funding in support of a first-time homebuyers program	Ongoing	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
18	Implement Housing Rehabilitation program through CDBG	Apply for funds in support of housing rehab and weatherization programs for low income households	Ongoing	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
19	Housing Choice Voucher Program	Continue to administer HCV program (Section 8)	Ongoing	Ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
20	Adopt Mobile Home Park Conversion ordinance	Adopt measures to encourage retention of mobile home and manufactured home housing, aid in relocation and provide compensation to owners and residents	Two Years	Draft policy complete and under review. Carried forward as Measure in 2013-2021 Housing Element Update.
21	Continue Code Enforcement efforts	Work with property owners to preserve the existing housing stock	Ongoing	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.

ANNUAL ELEMENT PROGRESS REPORT
Housing Element Implementation
(CCR Title 25 §6202)

Jurisdiction County of El Dorado

Reporting Period 1/1/2013 - 12/31/2013

22	Update list of subsidized dwellings	Track units subsidized by government funding or affordable housing developed through local regulations or incentives by income category as identified in the regional housing allocation	Annually	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
23	Review the Zoning Ordinance, policies, practices, and building codes to identify provisions that could pose constraints to the development of housing for persons with disabilities	Adopt an ordinance, pursuant to the Fair Housing Amendments Act of 1988, to establish a process for making requests for reasonable accommodations to land use and zoning decisions and procedures regulating the siting, funding, development and use of housing for people with disabilities	Three Years	Included in Comprehensive Zoning Ordinance Update. Carried forward as Measure in 2013-2021 Housing Element Update.
24	Community education on homelessness	Continue working with community and local organizations to build upon Continuum of Care Strategy and develop 10-year plan to end homelessness	Ongoing	Continue to meeting with Continuum of Care (CoC) stakeholders to address long-term homeless and transitional housing needs in the community. Carried forward as Measure in 2013-2021 Housing Element Update.
25	Define zoning for emergency shelters, transitional housing, etc. by right	As part of the Zoning Ordinance update, clearly define zone districts within which emergency shelters or transitional housing may be established by right	One Year	Completed. County currently considers shelters as Community Care Facilities allowed by right in three of four Commercial zones. SRO housing is currently allowed by right on parcels zoned for residential multi-family (RM). Carried forward as Measure in 2013-2021 Housing Element Update.
26	Improve energy and water use efficiency in existing homes and new construction	Support of the Environmental Vision for El Dorado County, Resolution 29-2008 for positive environmental change	One Year	Energy & Home Weatherization Program ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
27	Permit Mixed Use Development	Amend Zoning Ordinance to permit mixed use development within Commercial zones by right, subject to standards that encourages compact urban form, access to non-auto transit, and energy efficiency	One Year	Phase I approved. Phase II in progress. Carried forward as Measure in 2013-2021 Housing Element Update.
28	Agricultural employee housing	As part of the Zoning Ordinance update, comply with Health and Safety Code Section 17021.6 and encourage agricultural employee housing	One Year	Completed and additional measures in progress as part of the Comprehensive Zoning Ordinance Update. Carried forward as Measure in 2013-2021 Housing Element Update.

ANNUAL ELEMENT PROGRESS REPORT
Housing Element Implementation
(CCR Title 25 §6202)

Jurisdiction County of El Dorado

Reporting Period 1/1/2013 - 12/31/2013

29	Continue Housing Rehab Loan program	Continue to make rehabilitation loans to qualifying very low and low income households	Ongoing	Complete and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
30	Economic analysis for all 50+ unit residential developments	Ensure that appropriate public services and facilities fees are levied to provide public facilities and services to the project	One Year	Model study for analysis of potential fiscal impacts has been initiated. Evaluation of a funding program for economic analysis of affordable housing projects in progress. Analysis of individual projects is ongoing as needed. Carried forward as Measure in 2013-2021 Housing Element Update.
31	Update TIM Fee Program	Analyze anticipated lower trip generation and traffic benefits of a variety of housing types	Annually	In progress. Continue to offer fee offset program for qualified affordable housing units. Age Restricted Unit incentives approved and effective in April 2012. The Board of Supervisors authorized an update of the County's travel demand model to help guide the County through updating Traffic Impact Mitigation Fees and future land use planning, among other uses. Carried forward as Measure in 2013-2021 Housing Element Update.
32	Retain and rehab existing rental housing stock	Explore options including a proactive rental inspection enforcement program to address maintenance and Code Enforcement issues related to multifamily and single family rental residences	Two Years	In progress. CDBG funded exterior housing conditions study completed. Code Enforcement activity is ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
33	Fair Housing	Continue to refer people who suspect discrimination in housing to the appropriate agency or organization for help. Continue to distribute fair housing information as a part of its housing programs	Two Years	Completed and ongoing. Carried forward as Measure in 2013-2021 Housing Element Update.
34	Work with owners to preserve subsidized housing units	Identify funding sources to preserve at-risk units and identify qualified entities who are interested in purchasing government-subsidized multifamily housing projects	Ongoing	Ongoing. Strategy developed by HUD and USDA Rural Development is in place and administered by County to assist organizations in preserving subsidized housing units. Carried forward as Measure in 2013-2021 Housing Element Update.
35	Housing Conditions Study	Survey of housing conditions to determine the amount of housing in need of rehabilitation or replacement within older, established unincorporated neighborhoods	Two Years	Completed. CDBG funded exterior housing conditions study completed. Code Enforcement activity is ongoing.

ANNUAL ELEMENT PROGRESS REPORT
Housing Element Implementation
(CCR Title 25 §6202)

Jurisdiction County of El Dorado

Reporting Period 1/1/2013 - 12/31/2013

General Comments:

El Dorado County's Housing Element Update for planning period 2013-2021 has been certified by the California Department of Housing and Community Development (HCD).

State Housing and Community Development Assistant Deputy Director Glen Campora confirmed state approval in a November 13 letter noting, "The Department is pleased to find the adopted housing element in full compliance with State housing element law (Government Code, Article 1 0.6)."

El Dorado County Ordinance - Chapter 15.32 - Private Sewage Disposal System

El Dorado County Resolution No. 259-99 - Design Standards for the Site Evaluation and Design of Sewage Disposal Systems
Dated November 24, 1999

TABLE OF CONTENTS

EL DORADO COUNTY ORDINANCE:
CHAPTER 15.32 - PRIVATE SEWAGE DISPOSAL SYSTEMS

Section 2 - Design Procedures

A. GENERAL REQUIREMENTS

1. Soil and Groundwater Determination (Test Pits)

(a) Soil depth must be four (4) feet below the bottom of the trench.

(b) **Groundwater must be a minimum of four (4) feet below the bottom of the trench.** Unless mitigated by an approved special design system (as per section C-L).

2. Test Data Report - Test data report shall include the following:

Current assessors parcel number of property.
•(b) The person who performed the test, his address, zip code, phone number, title, registration number, and signature.
•(c) Weather conditions, time, and temperature at time of test.
•(d) The number of bedrooms in the existing or proposed structure(s), or number of fixture units if other than single family dwelling.
•(e) The location of test holes on a plot map. Include the contours or direction of slope of the land; location of lakes or streams, outcrops, existing or proposed structures or wells; location and approximate height of road cuts, if any, and location and type of surface vegetation.
•(f) Depth and soil profiles of each hole.

•(g) All percolation rate measurements taken and stabilized percolation rate. Report the percolation measurements and rates as minutes per inch (the minutes required for the water to drop one (1) inch in a six (6) inch hole).
•(h) **Percolation rates in excess of sixty (60) minutes per inch for standard leach lines and thirty (30) minutes per inch for non-standard leach lines shall require "Special Design".**
•(i) Describe soil profile in the leach field area - including roots, clay lenses, rock type and amount, texture, moisture, depth to groundwater, and other unusual aspects.
•(j) Soil description as per the soil survey of El Dorado County area, USDA.

. STANDARD SYSTEMS

1. Criteria for standard systems:

(a) Percolation rates between 5 and 30 min./in. with any depth of leach lines.

(b) Percolation rates between 30 and 60 min./in. for 3' x 3' leach lines.

Site evaluation criteria, design (including sizing), installation, and construction shall be in accordance with Section 1: General Provisions; Section 2-1: General Requirements; and Section 3: Construction and Materials.

C. SPECIAL DESIGN SYSTEM REQUIREMENTS

1. A special design system is any Department approved system that is not a standard system.

Conditions requiring special design include:

(**a) Percolation rates greater than 60 min./in.** for standard leach lines, greater than 30 min./in. for non-standard leach lines, or rates less than 5 min./in.
(b) Systems requiring a subsurface drain
(c) Off site systems requiring legal easement
(d) Capping Fill Systems
(e) Pressurized Distribution Systems
(f) Pump Systems
(g) Steep Slope Systems
(h) Sand Filter Systems
(i) Mound Systems
0) Package or Plant Systems
(k) All alternative or experimental systems

G. STEEP SLOPE SYSTEMS

1. A steep slope system is a system installed on sites with slopes greater than thirty (30) percent.

2. A steep slope system shall meet the following requirements:

(a) Steep slope systems are always special design systems.

(b) The designer must address distance from trench side wall to soil surface (side wall break out distance) and it must be a minimum of twenty four (24) inches to flow line as measured on the downhill side.

(c) Steep slope systems will not be approved on unstable land forms.

G. LEACH LINE CONSTRUCTION

1. Design Requirements

(a) Leach lines shall not be installed on a slope greater than thirty (30) percent without special engineering.
(b) Leach lines may be used under asphalt or concrete paving with special engineering.
(c) Gravel-less trench construction may be utilized instead of drain rock in the disposal trench. The design, manufacturing, and materials used shall be durable and acceptable to the Department. Sizing for gravel-less disposal trenches shall be done using one of the following options:
(1) Absorption area calculated using side wall and bottom area.
(2) Absorption area calculated using side wall area with a 25% reduction. NOTE: Side wall area for gravel-less chambers shall be calculated from the top of the ribs to the bottom of the trench.

Definitions for Small Water Systems

El Dorado County Environmental Health Division oversees the Small Water System program. The objective of the Small Water System program is to ensure that all systems operating in the County are in compliance with the California Safe Drinking Water Act and related regulations. The Environmental Health Division issues permits, monitors water quality data, and conducts routine inspections to verify compliance.

The following definitions are referenced from the California Health and Safety Code, Section 116275:

Public Water System is one in which the provision of water for human consumption through pipes or other constructed conveyances that has 15 or more service connections OR regularly serves at least 25 individuals daily at least 60 days out of the year.

- Community Water System is a public water system that has 15 or more service connections used by year-long residents OR regularly serves at least 25 year-long residents of the area served by the system.
- Noncommunity Water System is a public water system that is not a community water system.
- NonTransient-Noncommunity Water System is a public water system that is not a community water system that regularly serves at least 25 of the same persons during six months of the year.
- Transient Noncommunity Water System is a noncommunity water system that does NOT regularly serve at least 25 of the same persons during six months of the year.

State Small Water System (NOT a Public Water System) is a system for the provision of piped water to the public for human consumption that serves at least five, but not more than 14, service connections and does not regularly serve drinking water to more than an average of 25 individuals daily for more than 60 days out of the year.

Procedure for New Sewage Disposal System Approval:

The following general procedure will apply to all sewage disposal systems, both standard and special design:

I. Application for building permit will be taken at the Building Division - Permit Center.

II. The application will be sent to the Planning Division for approval.

III. The application will then be sent to the Environmental Health Division for approval.

IV. Prior to approval by the Environmental Health Division, all of the following data must be provided:

A. If the dwelling is served by an individual well or spring, the ORIGINAL well production report is required, accompanied by a plot plan signed by a licensed well driller.

- If the well was drilled after May 10, 1990, a separate well permit is required and must be finaled before this office can approve the Building Permit Application.

B. The percolation rate must be established by a percolation test performed on the parcel either by an individual percolation test, an accepted subdivision percolation rate, or by a percolation test performed for a parcel map. A registered civil engineer, geologist or registered environmental health specialist must do this test.

- If the percolation rate is less than 5 min./in., greater than 30 min./in., for deep trenches or greater than 60 min. /in., a special design sewage disposal system is required.
- **Ground slopes in the sewage disposal and replacement area shall not be greater than 30 percent**

Environmental Health

Septic System Minimum Setback Requirements

To protect water supply sources, surface water, and the proper function of a septic system, it is important to meet certain setbacks. Please refer to the following tables.

Leach Lines

From ephemeral (seasonal) stream/swale	50 feet
From flowing stream	100 feet
From well, spring, lake, or pond	100 feet
From lake or reservoir used for drinking water	200 feet
From trees	5 feet
From lot lines, roads, driveways, or buildings	10 feet
From a cut or fill (e.g., pool)	Four (4) times the cut or fill height
Shall not be placed under asphalt, concrete, or under areas subject to vehicular traffic	
Shall not be placed in fill material	

Septic Tank

From house	5 feet
From any building	5 feet
From trees	5 feet
From lot lines, roads, or driveways	5 feet
From streams, springs, lakes, or reservoirs	50 feet
From well or spring used for domestic purposes	100 feet
Shall not be installed in areas subject to high groundwater tables	

Well

Minimum horizontal separation distance between well and:	
Any sewer line (sanitary, industrial, or storm; main or lateral)	50 feet
Watertight septic tank or subsurface sewage leaching field	100 feet
Cesspool or seepage pit	150 feet
Animal or fowl enclosure	100 feet
The above horizontal separation distances are generally considered adequate. Wells should be located outside areas of flooding. The top of the well casing shall terminate above grade and above known levels of flooding caused by drainage or runoff from surrounding land. Area drainage should be directed away from the well, and if necessary, the area around the well shall be built up so that the drainage moves away from the well.	

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

WELL CONSTRUCTION AND WATER SUPPLY STANDARDS ORDINANCE [Chapter 8.39]

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

8.39.010 Purpose.

It is the purpose of this chapter to protect the health, safety, and general welfare of the people of the County of El Dorado by ensuring that groundwater of the County will not be polluted or contaminated. To this end, minimum requirements are contained in this chapter for construction, reconstruction, repair, and destruction of water wells, cathodic protection wells, soil borings, monitoring wells, and geothermal heat exchange wells. Further, reliable and safe water supplies for new construction and land developments are defined.

8.39.020 Definitions.

A. As Defined in Other Documents. Except as otherwise required by the context of this chapter, the terms used in this chapter shall have the same meaning as in Chapter 10 of Division 7 of the California Water Code and the California Division of Water Resources Bulletins 74-81, 74-90, and subsequent supplements or revisions.

B. Tense or Gender. Words used in the present tense include the future as well as the present. Words used in the masculine gender include the feminine and neuter. The singular number includes the plural, and the plural the singular.

C. Section headings, when contained in this chapter, shall not be deemed to govern, limit, modify, or in any manner affect the scope, meaning, or intent of the provisions of any section.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

1. "Abandoned well" means a well that has not been used for a period of one (1) year unless the owner demonstrates intention to use the well again by obtaining an inactive well permit.

2. “Active well” means a well that has a pump installed and is in use.

3. "Annular space" means the space between two well casings or between the casing and the wall of the drilled hole.

4. “Approved water supply” means any of the following: (a) a Public water system operating under permit issued by California State Division of Health Services or County of El Dorado Division of Environmental Management; (b) a State Small water system operating under permit issued by the Division; (c) drilled water wells that meet the requirements of this ordinance; or (c) springs constructed by approved methods to exclude surface water contamination and meet the requirements of this ordinance.

5. "Board" means the County of El Dorado Building Appeals Board.

6. “BOS” means the County of El Dorado Board of Supervisors.

7. "Cathodic protection well" means any artificial excavation in excess of fifty feet (50') deep constructed by any method for the purpose of installing equipment or facilities for the protection electrically of metallic equipment in contact with the ground, commonly referred to as cathodic protection.

8. "Contamination" means an impairment of the quality of the waters of the State such that it creates a hazard to the public health through poisoning, the spread of disease, hazardous materials, or other substances. "Contamination" includes any equivalent effect resulting from the release of contaminants, whether or not waters of the State are affected.

9. “Destroyed well” means a well that has been properly filled so that it cannot produce water and eliminates potential physical hazards that may exist. Destruction of wells ensures that the groundwater supply is protected and preserved for future use.

10. “Director” means County of El Dorado Division Director of Environmental Management or their authorized representative.

11. “Division” means the Environmental Management Division of the County of El Dorado Community Development Agency.

12. “Domestic water supply” is water used for indoor and outdoor household purposes— all the things you do at home: drinking, preparing food, bathing, washing clothes and dishes, brushing your teeth, watering the yard and garden, and even washing the dog.

13. "Enforcement agency" means the County of El Dorado Environmental Management Division.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

14. “Geothermal heat exchange well” means any uncased artificial excavation, by any method, that uses the heat exchange capacity of the earth for heating and cooling, in which excavation the ambient ground temperature is 30 degrees Celsius (86 degrees Fahrenheit) or less, and which excavation uses a closed loop fluid system to prevent the discharge or escape of its fluid into surrounding aquifers or other geologic formations. Geothermal heat exchange wells include ground source heat pump wells.

15. “Inactive well” means a well that has not been used for a period of one (1) year but that owner demonstrates intention to use in the future by obtaining an inactive well permit and maintaining the well as required in Section 8.39.160.

16. “Irrigation Well” means a well that is used to water crops. Irrigation wells are not used for drinking water collection.

17. "Monitoring well" (also called observation well) means any artificial excavation by any method for the purpose of monitoring fluctuations in groundwater levels, quality of underground waters, or the concentration of contaminants in underground water.

18. “Onsite wastewater treatment system" means a system of septic tank and subsurface dispersal system handling the waste from any structure not served by a community sewerage system.

19. “Person” means any individual, organization, partnership, business, association, corporation, or governmental agency to the extent authorized by law.

20. "Pollution" means an alteration of the quality of the waters of the State by waste to a degree which unreasonably affects (1) the waters for beneficial uses, or (2) facilities which serve these beneficial uses. "Pollution" may include contamination.

21. “Potable or safe water” means water that complies with maximum contaminant levels for primary drinking water standards of the constituents listed in Section 8.39.510.

22. "Property line" means the surveyed line separating one piece of property from another or separating public rights-of-way from private properties.

23. “Public water system” means a system for the provision of water for human consumption through pipes or other constructed conveyances that has 15 or more service connections or regularly serves at least 25 individuals daily at least 60 days out of the year. Public water systems can be either <u>Community</u> (a public water system that serves at least 15 service connections used by yearlong residents or regularly serves at least 25 yearlong residents of the area served by the system); <u>Non-community</u> (a public water system that is not a community water system);

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

or Non-transient non-community (a public water system that is not a community water system and that regularly serves at least 25 of the same persons over 6 months per year). (This includes systems regulated under Cal Code (California Health and Safety Code).

24. "Repair" or "reconstruction" means deepening or cleaning out of the well shaft, and can include the replacement and/or resealing of a well casing.

25. “Reliable water supply” means a water supply that has had an approved well production test to verify that the supply can meet minimum production requirements.

26. "Sewer" means a pipe carrying waste from any structure or a pipe that is a part of any community sewerage system.

27. “Slope” means the rise or fall of land as shown on a topographic map.

28. “Soil boring” (also called exploratory or test well) means an uncased artificial excavation constructed by any method for the purpose of obtaining information on subsurface conditions or for the purpose of determining the presence or extent of contamination in subsurface soils or groundwater and for seismic information.

29. “Source" means surface water, groundwater well, or spring.

30. “Spring” means a subsurface stream of flowing water that emerges naturally from rock or soil, and can be an approved source if constructed by approved methods to exclude surface water contamination.

31. “Stabilized water level during pumping” means that level of water in the well that remains constant after a period of pumping at a specific rate in gallons per minute. The required period of time for such pumping varies depending on the purpose of the well while the minimum period of time required is 4 hours for an existing parcel with a single family dwelling.

32. “State small water system” means a system for the provision of piped water to the public for human consumption that serves at least five, but not more than 14, service connections and does not regularly serve drinking water to more than an average of 25 individuals daily for more than 60 days out of the year.

33. “"Well" or "water well" means any artificial excavation constructed by any method for the purpose of extracting water from, or injecting water into, the underground. This definition shall not include: (a) oil and gas wells, or geothermal wells constructed under the jurisdiction of the Department of Conservation, except those wells converted to use as water wells; or (b) wells used for the purpose of (1) dewatering excavations during construction, or (2) stabilizing hillsides or earth embankments.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

PERMITS

8.39.030 Permits Required.

No person shall dig, bore, drill, deepen, modify, repair, or destroy a water well, cathodic protection well, soil boring, monitoring well, geothermal heat exchange well, or any other type of well excavation that may intersect ground water without first applying for and receiving a permit from the Division unless exempted by law.

8.39.040 Penalty for Failure to Obtain Permit.

Any person who shall commence any work for which a permit is required by this chapter without having obtained a permit shall be required, if subsequently granted a permit for this work, to pay additional fees as set by BOS resolution in Section 8.39.070.

8.39.050 Emergency Work.

The provisions of Section 8.39.030 shall not apply to emergency work required on short notice to maintain drinking water or agricultural supply systems. In such cases, the person responsible for the emergency work shall:

1. Apply for a permit within three (3) working days after commencement of emergency work;
2. Satisfy the Division that such work was urgently needed; and
3. Demonstrate that all work performed was in conformance with the technical standards.

8.39.060 Application Procedure.

Applications for permits shall be made to the Division on approved forms and shall contain all such information the enforcement agency requires to accomplish the purpose of this chapter. Applications shall include all of the following:

1. A vicinity map and clear driving directions to the property and well site.
2. Two (2) copies of an accurate site plan drawn to scale showing the proposed well location and the location of other significant features within 200 feet of the well location such as distances to property lines, septic tanks, leach lines, sewer lines, existing wells, streams or ponds, adjacent parcel development, structures, roads, driveways, easements, etc.
3. North arrow.
4. The scale used for the site plan.

5. Location and availability of alternative water source (i.e. Public water or existing well).

Note: Small parcels to be developed with an onsite wastewater treatment system may be required to provide additional design information prior to permit approval.

The signed application shall be submitted by the property owner or his representative, and will be accompanied by the required filing fee. If the Division finds that the application contains all necessary information and meets requirements for development eligibility, parcel size, and setbacks, a permit containing such conditions as are necessary to fulfill the purpose of this chapter shall be issued by the Division.

8.39.070 Fees.

Fees shall be collected by the Division for a permit to dig, bore, drill, deepen, modify, repair, or destroy a water well, cathodic protection well, soil boring, monitoring well, or geothermal heat exchange well. In addition, fees may be collected for revisions, inactivation permits, penalties, re-inspections, and appeals. The BOS sets fees by resolution.

8.39.080 Development Eligibility.

Water well Permits cannot be issued on a parcel unless both development eligibility (and parcel size) requirements are met. Parcels created by parcel map or subdivision shall be developed as designated for a domestic water supply.

Development Eligibility is also subject to County Ordinance Section 16.76.

8.39.090 Parcel Size.

Parcels are required to be a minimum of 5.0 acres to be approved for a water well permit. If parcel is less than 5.0 acres, the following exceptions may apply:

1. If parcel map or subdivision map does not designate the water supply, and parcel was created prior to May 26, 1977, a water well permit may be issued.
2. If not created by parcel map or subdivison, and parcel was in existence prior to May 26, 1977, a water well permit may be issued.
3. If parcel created by a gift deed recorded on or before October 10, 1983, a water well permit may be issued.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

4. If parcel was created after May 26, 1977 and before 2004 and the parcel is 4.5 acres a water well permit may be issued.
5.

8.39.100 Setbacks.

Consideration should be given to adequate separation from sites or areas with known or suspected soil or water pollution or contamination.

General separation guidelines are as follows:

Potential contamination source	Minimum setback distance to well (in feet)*
Sewer line (main or lateral)	50
Public drinking water main	50
Onsite wastewater treatment system (both septic tank and leach lines)	100
Animal or fowl enclosure **	100
Abandoned dump site	1000
Flooded areas and drainages	Avoid or divert away from well

*Lesser or greater separation distances may be approved by the Division based on specific site conditions.

** In cases where animal wastes constituting a nuisance as defined in County of El Dorado Solid Waste Management Ordinance, Section 8.42.020.

Notes:

- It is recommended that a well be placed 100 feet from a property line to protect the well from development of an adjacent parcel.
- If drill site is located within County of El Dorado zoning setbacks, no structure over 30” high can be constructed over the wellhead.

8.39.110 Permit Conditions.

When the Division issues a permit pursuant to this chapter, it may condition the permit in any manner necessary to carry out the purpose of this chapter. Conditions may include, but are not limited to, water quantity and quality testing methods as the Division finds necessary.

8.39.120 Persons Permitted to Work on Wells.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

All construction, reconstruction, or destruction work on wells shall be by a person who possesses an active C-57 contractor's license in accordance with the provisions of the Business and Professions Code, section 7000, et seq.

8.39.130 Proper Disposal of Drilling Fluids.

The permit shall contain a clause requiring the safe and appropriate handling and disposal of drilling fluids and other drilling materials used in connection with the permitted work. Approved site specific best management practices (BMP's) shall be implemented so that drilling fluids and soil cuttings remain on the permitted parcel unless another disposal method is approved for the site by the Division. Excavated pits dug for the disposal of drilling fluids shall be backfilled upon completion of the job. Wells drilled in the Tahoe Basin shall follow Tahoe Regional Planning Agency's BMP's for proper disposal of drilling fluids.

8.39.140 Classification of Wells.

Wells shall be classified as active, inactive, or abandoned.

8.39.150 Active well.

An active well is one that has a pump installed and is in use.

8.39.160 Inactive Well.

An inactive well is one that has not been used for a period of one (1) year but that the owner demonstrates intention to use in the future by obtaining an inactive well permit and shall meet the following criteria:

1. The well shall not allow impairment of the quality of water within the well and groundwater encountered by the well;
2. The well shall be maintained with a tamperproof watertight cover that cannot be removed without the use of equipment or tools in order to prevent unauthorized access, a safety hazard to humans and animals, and illegal disposal of wastes into the well;
3. The well shall be kept marked so as to be easily visible and located, and labeled so as to be easily identified as a well;
4. The area surrounding the well shall be kept clear of brush, debris, and waste materials.

Wells that are determined by the Division to be unsafe, improperly constructed or maintained, or pose a threat to groundwater shall be required to be destroyed.

8.39.170 Abandoned Well.

An abandoned well is required to be properly destroyed and an approved destruction permit shall be issued prior to the destruction.

As a condition of a construction or reconstruction permit, any abandoned wells on a parcel shall be destroyed in accordance with standards provided in this chapter.

8.39.180 Permit Denial.

The Division shall deny an application for a permit if, in its judgment, issuance of a permit is not in the public interest.

8.39.190 Permit Expiration.

The permittee shall complete the work authorized by the permit within one year of permit issuance. If there have been exceptional circumstances, and the permittee submits a written request prior to expiration of the permit, the Division may grant the applicant a one (1) year extension. Upon the expiration of the permit, no further work shall be done unless and until the applicant has received a new permit.

8.39.200 Voiding of Permit Application.

Permit applications that are submitted but not issued shall be voided if permit cannot be issued within one (1) year of permit submittal date.

8.39.210 Refund of Permit Fees.

Refunds for submitted permit applications may be made to the payor when requested in writing prior to the date of expiration or voiding of a permit application. Staff time spent reviewing and processing the permit may be deducted from the amount of the refund. If permit expires or is voided prior to requesting a refund, no refund shall be paid.

8.39.220 Permit Revisions.

Permit application revisions shall be submitted for review and approval as follows:

1. Change of driller: Requires an amended permit application specifying the new driller and a new site plan.
2. Change of drill site: Requires new site plan.
3. Permit extension: Requires written request explaining the exceptional circumstances as to why the well was not drilled within the initial permit period.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

8.39.230 Permit Suspension and Revocation.

The Division may suspend or revoke any permit issued pursuant to this chapter; whenever it finds that the permittee has violated any of the provisions of this chapter, or has misrepresented any material fact in his application or any supporting documents for such a permit. Prior to ordering any such suspension or revocation, the Division shall give the permittee an opportunity for a hearing thereon, after reasonable notice. The hearing shall be before the Director or their authorized representative. An appeal may be made as set forth in section 8.39.290.

No person whose permit has been suspended or revoked shall continue to perform the work for which the permit was granted until, in the case of suspension, the Director has reinstated such permit.

8.39.240 Ordered Additional Work.

Upon suspending or revoking any permit, if any work already done by the permittee has left a well in such a condition as to constitute a hazard to the quality of groundwater, the Division may order the permittee to perform any work reasonably necessary to protect groundwater from pollution or contamination. No permittee or person who has held any permit issued pursuant to this chapter shall fail to comply with any such order.

8.39.250 Well Standards.

Except as otherwise specified, the minimum standards for the construction, repair, or reconstruction, or destruction of wells shall be as set forth in State Department of Water Resources "Water Well Standards " Bulletins 74-81, 74-90, and subsequent supplements or revisions.

8.39.260 Variances.

The Director shall have the power under the following specified conditions to grant a variance from any provision of the standards referenced in Section 8.39.250 and to prescribe alternative requirements in their place if:

1. A special circumstance exists where practical difficulties or unnecessary hardship would result from the strict interpretation and enforcement of any such standard.
2. The granting of such a variance is consistent with the purposes of this chapter.

8.39.270 Special Ground Water Protection.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

The Director may designate areas where groundwater quality problems are known to exist and where a well will penetrate more than one water bearing zone. The Director may require in these designated areas special well seal(s) to prevent mixing of water from several zones. Where an applicant proposes well construction, reconstruction, or destruction work in such an area, the Division may require the applicant to provide a report with the permit application prepared by a California Registered Professional Geologist, or a California Registered Professional Engineer (as defined in the California Business and Professions Code) that identifies all strata containing poor quality water and recommends the location and specifications of the seal or seals needed to prevent the entrance of poor quality water or its migration into other water bearing zones.

8.39.280 Other Agency's Requirement.

Nothing in this chapter shall be deemed to excuse any person from compliance with the provisions of California Water Code section 13752 relating to notices and reports of completion or any other federal, state, or local reporting regulations.

8.39.290 Appeals.

Any person whose application for a permit has been denied, granted conditionally, been suspended or revoked, or whose variance request has been denied, may appeal to the County of El Dorado Building Appeals Board.

8.39.300 Violation a Misdemeanor.

Any person who violates any of the provisions of this ordinance is guilty of a misdemeanor, and upon conviction thereof is punishable by such penalties as set forth in Section 1.24.020 of this code.

8.39.310 Notice of Violation.

A notice of violation shall be issued and shall be recorded with the County Recorder whenever the Division determines that:

1. A well has not been completed in accordance with a well permit or the plans and specifications relating thereto;
2. A well has been constructed or destroyed without a required permit; or
3. An abandoned well has not been destroyed in accordance with the standards.

The owner(s) of the property, as revealed by the assessment roll, on which the violation is situated, and any other person responsible for the violation shall be notified of the recordation, if their address is available.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

If the property owner(s) or authorized agent disagrees with the determination, he may submit evidence to the Division and shall have a right to appeal an adverse decision of the Director to the Board in accordance with the provisions of section 8.39.290.

8.39.320 Decision by Board.

The Board may reverse, affirm, or modify, wholly or in part, the decision or the notice of violation; and may make such order as should be made. Such action shall be final.

8.39.330 Removal of Violation Notice.

The Division shall submit a removal of notice of violation to the County Recorder when:

1. It is determined by the Division or the Board, after review, that no violation of this chapter exists; or
2. All required and corrective work has been completed and approved by the Division.

8.39.340 Civil Enforcement.

Violations of this chapter may also be redressed in the manner hereinafter set forth by civil action. In addition to being subject to prosecution, any person who violates any of the provisions of this chapter may be made the subject of a civil action. Appropriate civil action includes, but is not limited to, injunctive relief and cost recovery.

8.39.350 Remedies Cumulative.

The remedies available to the Board to enforce this chapter are in addition to any other remedies available under ordinance or statute, and do not replace or supplant any other remedy but are cumulative thereto.

8.39.360 Severability.

If any section, subsection, paragraph, sentence, clause, or phrase of the ordinance codified in this chapter is for any reason held to be invalid or unconstitutional by a decision of a court of competent jurisdiction, it shall not affect the remaining portions of this ordinance, including any other section, subsection, sentence, clause, or phrase therein.

8.39.370 Regulations.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

The Director is authorized to make such regulations for the protection of groundwater against pollution and contamination, and for protection of public health.

8.39.380 Right of Entry and Inspection.

Representatives of the Division shall have the right to enter upon any premises at all reasonable times to make inspections and tests for the purpose of such enforcement and administration. If any such premises are occupied, he shall first present proper credentials and demand entry. If the same is unoccupied, he shall first make a reasonable effort to locate the owner or any person having charge or control of the same and demand entry. If such entry is refused, he shall have recourse to such remedies as are provided by law to secure entry.

8.39.390 Submittal of State "Well Completion Report".

The driller shall provide the Division and the State Department of Water Resources a well completion report within sixty (60) days of the completion of any well construction, reconstruction, or destruction. This report shall document that the work was completed in accordance with the standards and all additional permit conditions.

8.39.400 Confidentiality of State "Well Completion Report".

Reports made in accordance with 8.39.390 shall not be made available for inspection by the public, but shall be made available to governmental agencies for use in making studies, or to any person who obtains a written authorization from the owner of the well.

WATER WELLS

8.39.410 Inspections.

1. Upon receipt of an application, the Division may inspect the drilling site prior to issuance of a well permit. The purpose of this inspection is to determine whether site conditions exist that would preclude approval of the proposed site.
2. The Division may inspect the annular seal depth prior to sealing and at any other time that the well is under construction.
3. The Division may make a final inspection after completion of the well to determine whether the well was completed in accordance with this chapter.

8.39.420 Re-inspection Fees.

If site is not ready for a scheduled inspection and inspection cannot be completed, additional fees may be assessed in accordance with the Division's fee schedule and payable prior to a re-inspection.

8.39.430 Required Notices.

Move on notice: The well driller shall notify the Division twenty-four (24) hours prior to commencement of drilling.

Seal inspections - Self Certification:

1. Each well driller or consultant must register in order to conduct inspection of well seal or destruction by filling out the Water Well Inspector Registration Form with the Division.
2. When seal or destruction is to take place the Division will be notified of the date and time, and then registered inspector can inspect seal or destruction as appropriate.
3. To finalize the permit the well seal record must be filed with the Division. The **well permit will not be finalized if this form is not received.**

8.39.440 Should Division Fail to be Present.

If the Division grants approval to allow a seal to be poured without inspection and there is not a registered inspector available, the driller shall seal the well in accordance with the standards of this ordinance and any permit conditions. No seal shall be poured until permission to proceed has been received by scheduling seal time as required in Section 8.39.410 and waiting a minimum of 30 minutes past the scheduled seal time unless other arrangements are made with Division staff.

8.39.450 Finished Construction Specifications for Public Water Wells.

1. Provide a concrete base around the well casing that extends at least 2 feet in all directions, 4 inches thick, with the upper surface sloping away from the casing unless other construction methods are approved by the Division.

2. Wellhead shall be fitted with a sampling tap, located on the discharge line between the wellhead and the check valve.

3. Wellhead shall be fitted with a vent, either a downturned screened elbow, or other approved venting method.

4. Wellhead shall be equipped to be easily accessible for spot chlorinating.

5. Wellhead shall be protected by a locking structure, or other method of

security.

6. Public water well construction and operation shall comply with Title 22, California Code of Regulations, Chapter 16, and the California Waterworks Standards.

WATER SUPPLIES FOR BUILDING PERMITS (existing parcels)

8.39.460 Water Well Construction and Production Requirement.

Acceptable water wells are those which are constructed to the standards specified in "Water Well Standards", State of California, Department of Water Resources, Bulletins 74-81, 74-90, and subsequent supplements or revisions; and which are capable of providing to each connection a minimum of five (5) gallons per minute, either from the well itself or a combination of well and storage. Wells producing less than one (1) gallon per minute shall not be accepted as an adequate water supply.

The production capacity of a well for a single family dwelling shall be determined from a four (4) hour well production test as defined in 8.39.470. The production capacity is valid for two years from the date of testing and shall be certified with an original signature by a licensed well driller, licensed pump contractor, or other professional person approved by the Division.

8.39.470 Water Well Production Test Procedures.

The capacity of a well drilled in hard rock on existing parcels shall be determined from a well production test. For a single family dwelling, the test shall be conducted for a minimum 4 hours and until there is a stable rate of pumping for 4 hours. The test shall meet one of the following approved test methods as defined by the California Groundwater Association or by another approved method acceptable to the Division:

1. Constant Yield and Drawdown - Test-pump installed

   The Constant Yield and Drawdown Test requires that the water in storage in the well be removed until a stable pumping level is established. The duration of the test period. The yield that maintains this constant pumping level at the end of the test period is the constant yield. The test period shall continue as long as necessary to achieve a 4-hour constant yield.

2. Water Recovery - Test-pump installed

   The Water Recovery Test is performed by pumping all of the water out of the well or at least until the pump breaks suction, then waiting a specific amount of time (often determined during testing) and again pumping the well down to the level of the pump. A flow meter (or other approved test starts at this point, and a constant pumping level is maintained for the method) is installed to record the amount of water pumped out and by measuring the time between pump-downs and the amount of water pumped, a recovery rate is computed. The recovery test yield is the stable yield that is sustained for 4 hours. The test period shall continue as long as necessary to achieve a 4-hour stable recovery rate. This test is based on the assumption that the test pump is capable of over-pumping the well.

3. Air lift Test - During Drilling

   The airlift test is performed before or after the completion of the well, with the open end of the drill stem inserted into the borehole and the contained water blown out using the rig's compressor system. The compressed air lifts the water in the well to the surface where the volume of water produced is measured per unit of time in order to establish a sustained yield in gallons per minute. The 4-hour test period shall begin after the last water fracture is encountered.

For wells used for other than a single family dwelling, the Division shall determine the length of the pump testing required.

Public Water System wells are required to be pump tested for a minimum of 72 hours following criteria specified by the Division and the California State Department of Health Services, Division of Drinking Water.

Pumping discharges shall be managed in compliance with approved site specific Best Management Practices and shall not be allowed to enter a storm drain system or a watercourse.

8.39.480 Spring Construction and Production Requirement.

Springs which are constructed to the standards specified by the Division following guidelines developed by the California State Division of Health Services; and which are capable of providing to each connection a minimum of five (5) gallons per minute, either from the spring itself or a combination of spring and storage. Springs producing less than one (1) gallon per minute shall not be accepted as an adequate water supply.

The production capacity of a spring shall be determined by measuring the discharge flow rate during the driest months of the year (primarily during the Fall season). The production capacity of a spring is valid for two years from the date of testing and shall be certified by a licensed well driller, licensed pump contractor, or other professional person approved by the Division.

Springs that contribute to a flowing stream, either by surface or subterranean means, are required to obtain a permit for diversion and use from the State Water Resources Control Board.

8.39.490 Production Test Report Requirements.

Well production test reports shall include the start and end time of the test period.

Test reports shall be submitted on company letterhead and signed by the person performing the test.

8.39.500 Water Storage Requirement.

For wells or springs producing less than five (5) gallons per minute, a minimum 1000-gallon storage tank shall be installed. Additional structures on a parcel may increase the storage tank size requirement.

8.39.510 Water Quality.

A report of water quality, analyzed by a California State certified laboratory, shall be submitted to the Division on the proposed water supply prior to final of a building permit. Water quality testing conducted as part of the land development process satisfies this requirement except for current coliform testing (analyzed within one year of permit submittal).

Water supplies that do not meet State primary drinking water standards for acute health risks shall not be approved for use without installation of a certified treatment system that reduces the contaminant level to safe health standards. Initial results that exceed standards may be re-sampled by an approved third party to determine compliance.

Primary acute health risks, such as:

Total and fecal coliform	Nitrate (as NO3)
Nitrite (as nitrogen)	Nitrate plus Nitrite (sum as nitrogen)
Arsenic	

Water supplies that exceed State primary drinking water health standards (Title 22) for chronic contaminants shall have a deed restriction recorded on the parcel that the water supply is not potable without installation of a certified treatment system that reduces the contaminant level to safe health standards.

Additional water quality parameters may be required depending on the location of the parcel, susceptibility to other contaminants, and future drinking water standards.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

GEOTHERMAL HEAT EXCHANGE WELLS

8.39.520 Geothermal Heat Exchange Well Standards.

All geothermal heat exchange well installations or destructions shall conform with State Department of Water Resources "Water Well Standards" Bulletins 74-81, 74-90, and subsequent supplements or revisions for construction methods and materials.

MONITORING WELLS

8.39.700 Permits Required.

No person shall dig, bore, drill, deepen, modify, repair, or destroy a soil boring, monitoring well, or other exploratory boring without first applying for and receiving a permit from the Division unless exempted by law.

8.39.710 Persons Permitted to Work on Wells.

All construction, reconstruction, or destruction work on soil borings, monitoring wells, or other exploratory borings shall be by a person who possesses an active C-57 contractor's license in accordance with the provisions of the Business and Professions Code, section 7000, et seq.

8.39.720 Monitoring Well Standards.

All monitoring wells/soil boring/exploratory boring installations or destructions shall conform with State Department of Water Resources "Water Well Standards" Bulletins 74-81, 74-90, and subsequent supplements or revisions for construction methods and materials.

8.39.730 Pre Drilling Requirements.

Prior to drilling, a line-locating service shall be used to identify any potential drilling obstructions.

8.39.740 Temporary Containment Prior to Lab Analysis.

All equipment, drill cuttings, and well development water shall be temporarily contained in United States Department of Transportation (DOT) approved drums on site until lab analysis is complete. Drums shall be properly labeled and dated. Temporary storage time shall not exceed 90 days.

8.39.750 Finished Construction Features.

Monitoring wells shall be completed in one of two ways: 1) flush or slightly above existing grade with an in-ground type vault box with protective cover, or 2) above grade with a protective, oversized riser and lockable cover set in a 2' by 2' concrete base or pad with the surface sloping away from the well casing. Protective traffic bollards may also be required with this type of completion.

Each well shall be locked, numbered, and notched or marked on the north side for surveying and well measurements.

8.39.760 Equipment Cleaning Before and Between Uses.

All equipment used in drilling and sampling activities must be properly cleaned before and between each uses.

8.39.770 Prohibited Materials.

Chemicals, glues, and solvents shall not be used in the construction of monitoring wells/soil borings.

8.39.780 Re-inspection Fees.

If site is not ready for a scheduled inspection and inspection cannot be completed, additional fees may be assessed in accordance with the Division's fee schedule and payable prior to a re-inspection.

8.39.790 Annual Permits and Inspections.

An annual permit fee may be charged and an annual inspection may be conducted to confirm the status of the monitoring well.

8.39.800 Additional Requirements.

Other requirements may apply at the discretion of the Division.

8.39.810 Final Inspection.

A final inspection shall be scheduled with the Division at a minimum of 48 hours advance notification. If the final inspection is conducted by a certified inspector, 48 hours advanced notice to the Division is still required.

8.39.820 Initial Investigation and Report for Destructions.

Prior to destroying a monitoring well, it shall be investigated to determine the construction details, maintenance history, and current condition. A work plan including the investigation findings and destruction method shall accompany the permit application.

8.39.830 Removal and Disposal of Obstructions and Contaminants.

Wells shall be sounded immediately prior to destruction to ensure they are free of obstructions. If any chemical contaminants are observed, the Division shall be immediately notified in writing. Wells shall be cleaned to remove and properly dispose of all obstructions and contaminants.

8.39.840 Destruction of Approved Monitoring Wells.

An authorized Division representative shall determine the appropriate destruction method for a monitoring well based on the well construction and /or other administrative issues. The typically accepted monitoring well destruction methods are 1) the well may be drilled out to the true depth of the original boring and the resultant boring backfilled with approved sealing material; or 2) the well may be pressure grouted in place. During the pressure grouting procedure, a minimum of 25 pounds per square inch shall be maintained for five minutes or until pumping refusal.

In some cases, additional sealing requirements will be stipulated on the permit. Division requirements may be more stringent than California well standards.

All waste generated during destruction activities shall be properly managed: this includes, but is not limited to, all waters generated during debris removal or seal placement.

For wells constructed and maintained in accordance with California Well Standards, casing that is more than 5 feet below ground surface may be left in place. The casing shall be filled with sealing material up to 5 feet below ground surface. After sealing material has set, a 5-foot deep hole shall be excavated around the casing and the casing cut off at the bottom of the hole. The excavation shall then be filled with clean native soil.

8.39.850 Destruction of Unapproved Monitoring Wells.

For wells not constructed and maintained in accordance with California Well Standards, all material within the original borehole (casing, screen, filter pack, etc.) shall be removed. The borehole shall be completely filled with impervious sealing material.

8.39.860 Acceptable Sealing Materials.

Pressure grouting shall be completed using neat cement grout. No aggregate sealing materials may be used.

FINAL DRAFT OF PROPOSED WELL CONSTRUCTION & WATER SUPPLY STANDARDS ORDINANCE updated August 14, 2014

Boreholes resulting from well drill-outs may be backfilled with neat cement grout, 10-sack sand cement grout, or hydrated high solids 20 percent bentonite slurry. No bentonite chips or pellets are allowed.

Up to 5 percent bentonite clay may be added to a cement mixture.

8.39.870 Placement Of Sealing Material By “Tremmie” Pipe.

Sealing material shall be placed by “tremmie” pipe or equivalent method in one continuous operation. A tremmie pipe must be used to place the cement sealing material if a well or boring is more than 30 feet deep or if more than 3 feet of water is present in the annular space to be sealed.

8.39.880 Placement Of Sealing Material By Free Fall Method.

Sealing material may be placed by free fall method only if the well is dry, less than 30 feet deep, and does not result in bridging or voids. Volume/fill calculation shall be completed to document successful destruction.

8.39.890 Destruction of Soil Borings.

Soil borings shall be completely filled with sealing material. Sealing material may be placed by free fall method only if the boring is dry, less than 30 feet deep, and does not result in bridging or voids. Volume/fill calculation shall be completed to document successful destruction.

8.39.900 Permit Expiration-Monitoring Wells.

The permittee shall complete the work authorized by the permit within one (1) year of permit issuance. Upon the expiration of the permit, no further work shall be done unless and until the applicant has received a new permit.

8.39.999 Conflicts

The operation of this chapter shall in no way change or diminish the application of other ordinances, County plan, policy or regulation already disallows a water well.
In any case where a provision of this chapter is found to be in conflict with a provision of any zoning, building, fire safety or health ordinance or section of the Code, the provision which establishes the higher standard for the promotion and protection of the health and safety of the people shall prevail.

Sampling Requirements for Community Water Systems using a Groundwater Source

Definition of Community: Serves at least 15 service connections used by yearlong residents OR regularly serves at least 25 yearlong residents.
ref. 64400.10

General monitoring requirements for each source:

1. Secondary standards (due every three years)

- aluminum
- bicarbonate, carbonate, and hydroxide alkalinity
- calcium
- chloride
- color
- copper
- corrosivity
- foaming agents (MBAS)
- iron
- magnesium
- manganese
- odor--threshold
- pH
- silver
- sodium
- sulfate
- specific conductance or total dissolved solids
- thiobencarb
- total hardness
- turbidity
- zinc ref 64449

2. Inorganic Chemical analyses (due every three years)

- aluminum
- antimony
- arsenic
- asbestos
- barium
- beryllium
- cadmium
- chromium
- cyanide
- mercury
- nickel
- selenium
- thallium
- fluoride

- nitrite (as nitrogen)
- nitrate and nitrite (sum as nitrogen)
- nitrate (as NO3) due every year
  ref. 64432

3. Radiological analyses (due every four years)

Gross alpha from four consecutive quarterly samples (samples can be held by the Laboratory and composited to hold costs down) ref. 64441

4. Organic Chemical analyses (due every six years)

VOC's using approved EPA methods, and including Methyl tertiary butyl ether (MTBE). Synthetic organic chemical analyses are waived unless vulnerable.
ref. 64445

5. Unregulated Chemicals

- boron and vanadium
- Additionally, if vulnerable, sampling required for chromium 6, dichlorodifluoromethane, ETBE, perchlorate, TAME, TBA, TCP ref. 64450

General Bacteriological sampling requirements:

Sampling for total coliforms is based on the known population served or the total number of service connections, whichever results in the greater number of samples (minimum is one sample per month).ref. 64423

Repeat sampling for a total coliform present sample consists of 4 repeat samples following the Sample Siting Plan.

Submission and approval of a Sample Siting Plan that follows the County guidelines is required.ref. 64422

Submission and approval of a Sample Siting Plan that follows the County guidelines is required.ref. 64422

Other requirements:

Permit application packet

Annual water quality report to consumers

Public notification as required for quality or procedural failures

Lead notice to consumers

Annual emergency notification plan

Certified Distribution System Operator for all community water systems

Certified Treatment Plant Operator for all community water systems providing treatment

****All analyses must be done by a State approved laboratory.**

Please note: the above requirements are subject to change as the State of California modifies and/or clarifies their regulations.

COMMUNITY REGION BOUNDARIES

EL DORADO COUNTY COMMUNITY DEVELOPMENT AGENCY
LONG RANGE PLANNING DIVISION

BOARD OF SUPERVISORS

February 24, 2015

INTRODUCTION

- Proposed Project Background
- Origin of Community Regions
- Project Analysis and Environmental Review Matters to Consider
- Funding Options
- Recommended Board Action

BACKGROUND

Board Hearings and Actions Related to the Camino/Pollock Pines Community Region

2009:

The Board discussed changing the Camino-Pollock Pines area from a Community Region to a Rural Center; Planning Commission held a public workshop on the proposed amendments; BOS adopted ROI 110-2009 with intent to remove the CR boundary and convert to 2-3 Rural Centers without land use changes

2011:

The BOS directed staff to integrate the previous ROI for the Camino/Pollock Pines Community Region into the TGPA-ZOU Project ROI.

2012:

The BOS authorized review via TGPA-ZOU to create 3 Rural Centers of Camino, Cedar Grove and Pollock Pines.

2013:

The BOS directed staff to continue processing the proposed CR changes under the TGPA-ZOU Project.

Board Hearings and Actions Related to the Shingle Springs and El Dorado Hills Community Regions

2013:

Board directed staff to:

Prepare Community Region White Paper. Based on the White Paper the Board:

Directed staff to return with a work plan pertaining to costs, and

Next steps and options for moving the Shingle Springs and El Dorado Hills Community Region boundary lines

2014:

The Board directed staff to prepare a ROI to contract the Community Regions of Shingle Springs and the Green Valley corridor and to prepare prioritization and funding options to implement the above ROI.

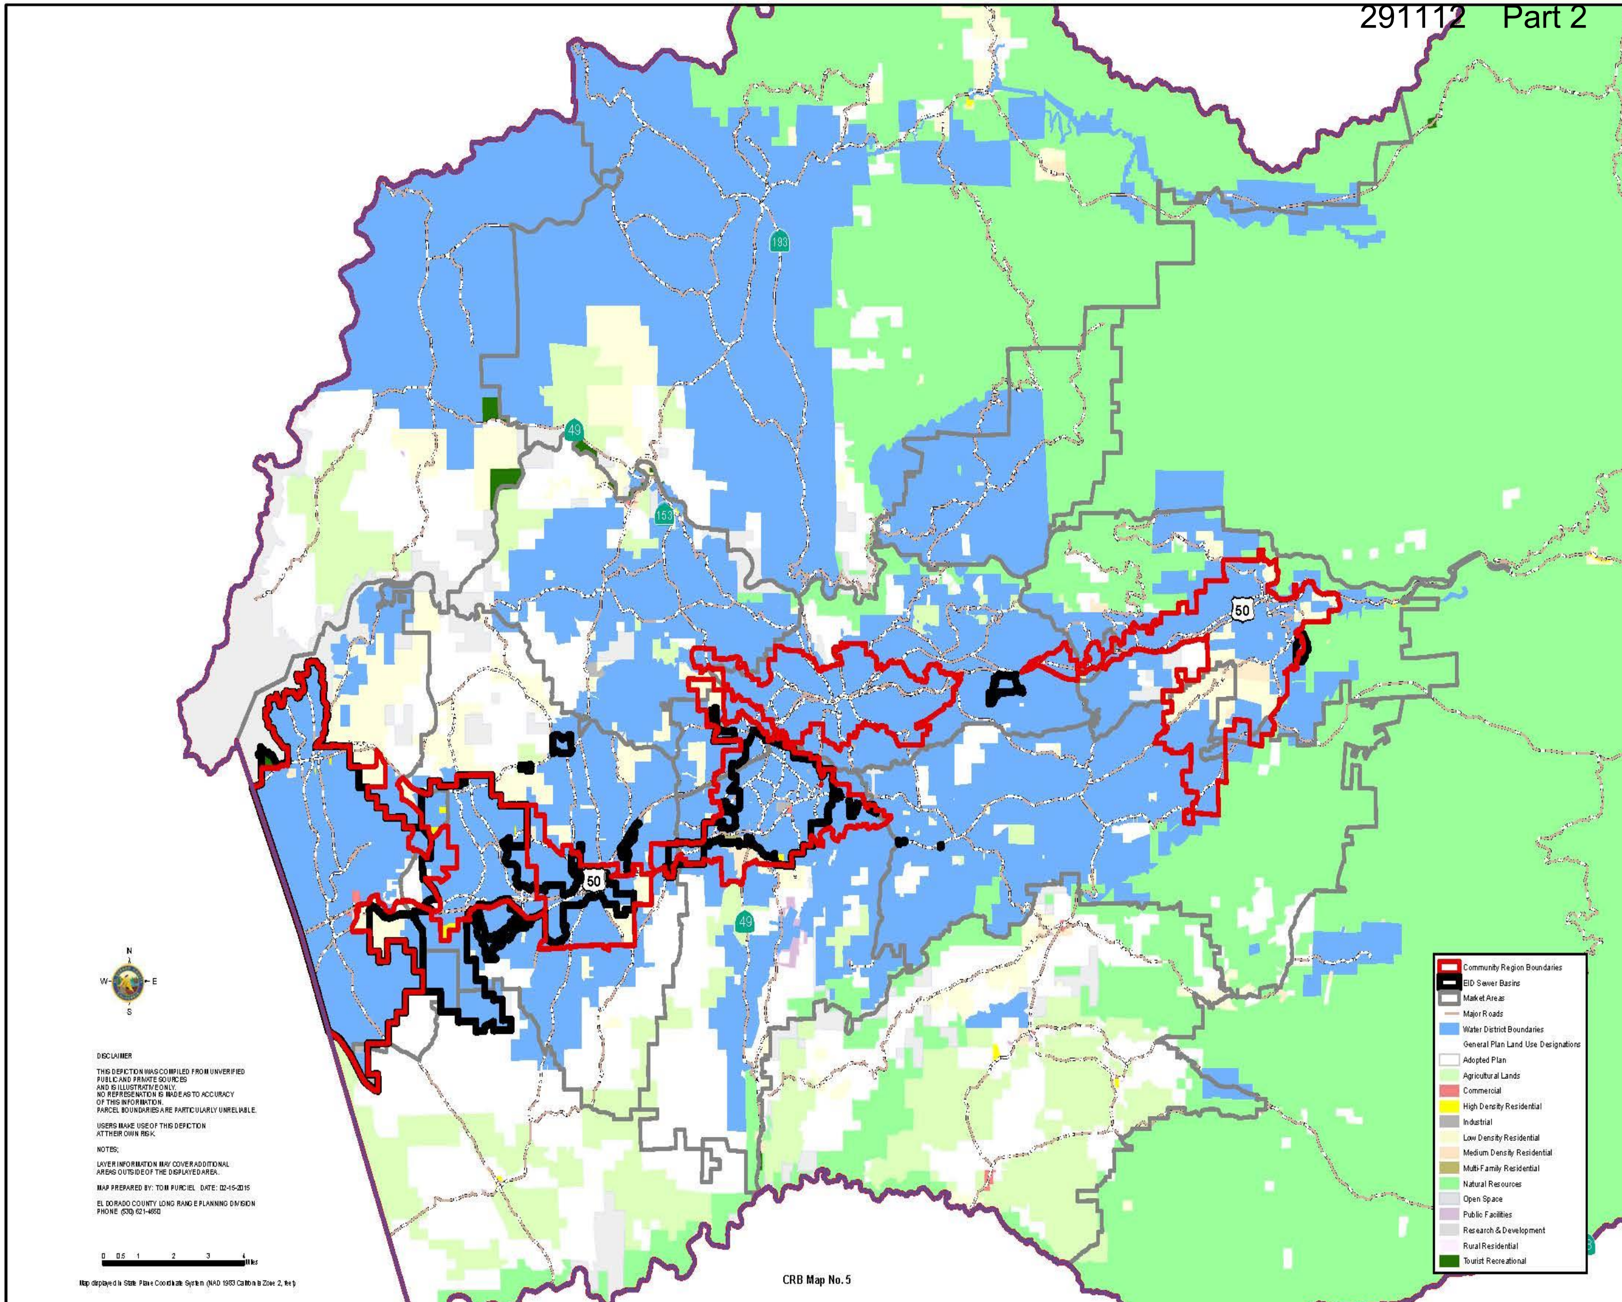
ORIGIN OF COMMUNITY REGIONS

Community Regions were first designated and adopted in the 1996 General Plan.

- Community Region boundaries guide growth to areas with:
  - adequate infrastructure;
  - adequate public services;
  - access to major transportation corridors

  (Policies 2.1.1.2 and 2.1.1.7)
- Community Region boundaries provide opportunities for continued population growth and economic expansion where adequate infrastructure and services are available;
- Community Regions allow for a mix of uses that promote alternate transportation systems.

291112 Part 2



PROJECT ANALYSIS/ENVIRONMENTAL REVIEW MATTERS TO CONSIDER

- 2004 General Plan EIR and Findings
  - Land availability to meet housing and job growth projections
  - Change of growth patterns
  - Limits on infill opportunities (e.g. new development in areas already served by infrastructure and public services)
  - Fiscal, safety and other effects including changing roadway Level of Service ("LOS") standards from E to D and reducing required response times for fire districts, sheriff, & ambulances
  - Cost of housing and infrastructure
  - Economic development and business attraction

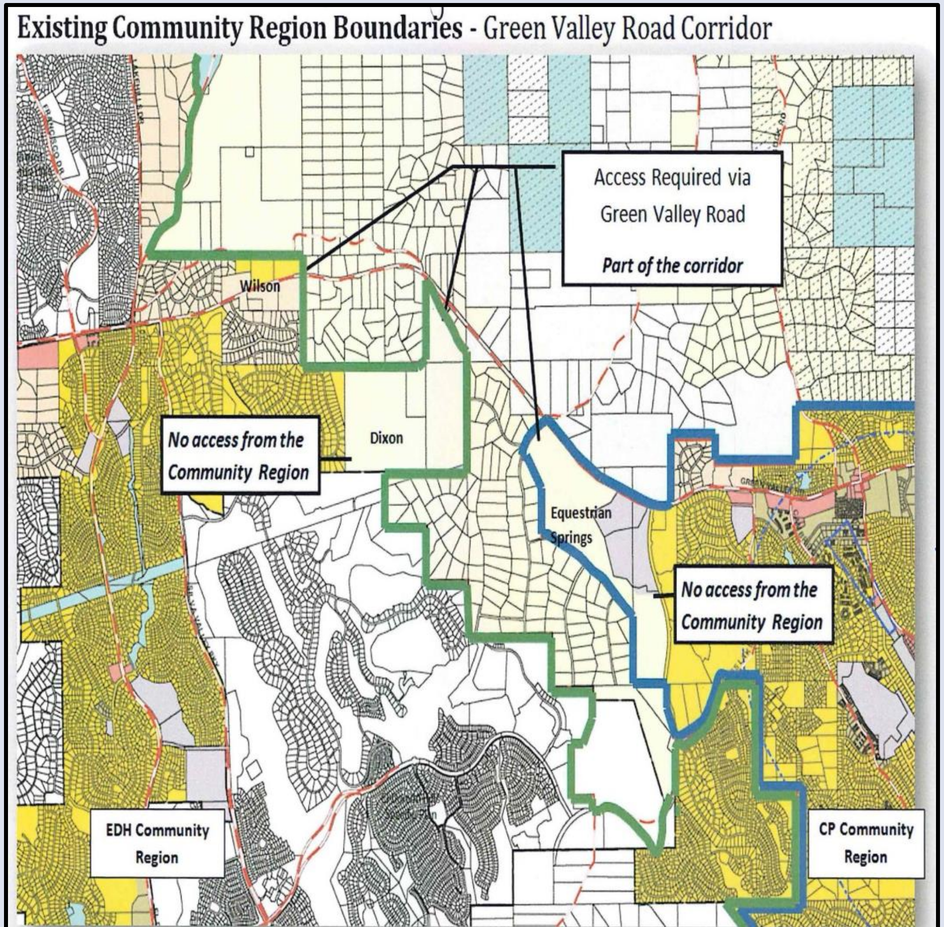
2035 GROWTH PROJECTIONS

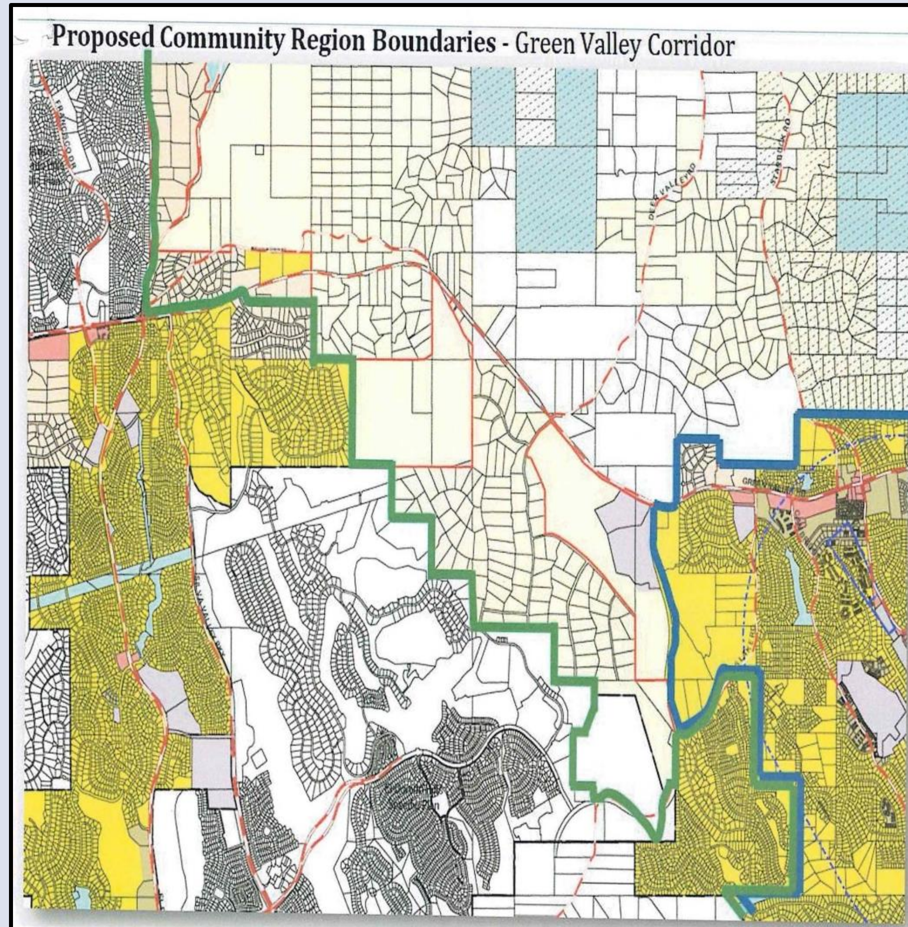
Approximately 17,500 new units over 20 years

75% Community Region* (Within EID Service Area)		25% Rural Center and Rural Region (EID, GDPUD, Other purveyors or private wells)		Total
Single Family Existing or Entitled	8,000	Single Family Existing or Entitled	4,200	**12,200**
Single Family Remaining	3,000	Single Family Remaining	0	**3,000**
Multi Family**	2,100	Multi Family**	200	**2,300**
Total CRs	13,100	**Total RC and RR**	4,400	**17,500**

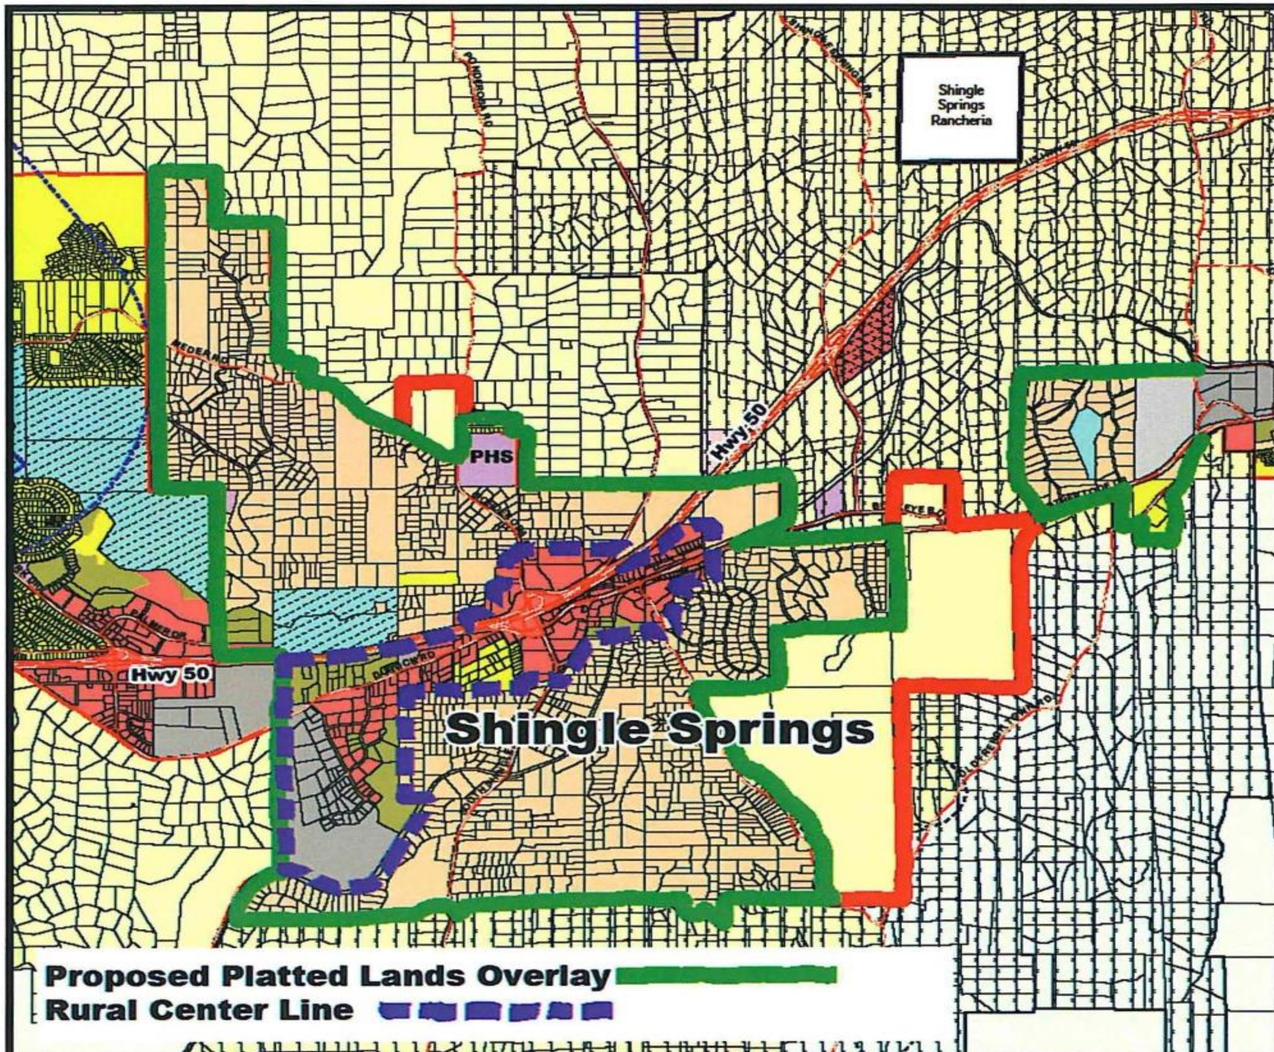
Note: All numbers are rounded
*Assumes Camino/Pollock Pines is changed to 3 Rural Centers
**Multi Family units based on 2013-2021 RHNA allocation. This number is subject to change in 2021 at next Housing Element Update

EL DORADO HILLS AND CAMERON PARK MAP





SHINGLE SPRINGS MAP



PROJECT ANALYSIS/ENVIRONMENTAL REVIEW MATTERS TO CONSIDER CONT.

- 2004 General Plan Consistency
- Housing Element
  - The County must identify, analyze and reduce or eliminate impediments to the development of housing for all income levels
  - The County must accommodate it's fare share of housing
  - 2013 Housing Element - *The State of California has declared the lack of housing is a critical problem that threatens the economic, environmental, and social quality of life in California. Any action that conflicts with the ability of the County to meet the goals of this General Plan and California Law, including but not limited to Housing Element Law, Government Code Section 65585, would be found inconsistent with State and local regulations.*
  - Possible indirect effect on parcels adjacent to Platted Lands

FUNDING OPTIONS

- CEQA costs could range from $10-20,000 in staff time to prepare a Negative Declaration, or up to $150,000 in consultant costs if an EIR is necessary
- Initial Study prepared by staff will determine ND vs EIR; analysis to date indicates an EIR may be necessary
- Three options if EIR is needed:
  - Allocate money from the General Fund contingency
  - Use General Fund money budgeted for outside legal costs that would otherwise be returned to General Fund this FY
  - Discuss funding as part of the FY 2015/16 budget (Staff's recommendation)

PROJECT PRIORITIZATION

Staff has been generally prioritizing projects based on the following:

Draft Project Prioritization Matrix

291112 Part 2

Major County-Initiated Land Use and Transportation Projects Managed by Long Range Planning Division (LRP)

		Priority: Get things done by finishing what we've started	**Priority:** Economic development	**Priority:** Set strong countywide foundation	**Priority:** Address requirements	
		Intent: Prioritize projects already initiated by Board and currently underway	Intent: Prioritize projects that directly improve economic development	Intent: Prioritize projects that address key issues affecting entire county	Intent: Prioritize projects required by General Plan, law, or other mandates	
LRP's Major County-Initiated Land Use and Transportation Projects	**Timeframe**	**Question:** Is the project currently in process?	**Question:** Does the project directly improve Economic Development?	**Question:** Does the project address an issue affecting the entire county?	**Question:** Is the project required by policy, law or other mandates?	Recommended Project Prioritization
TGPA/ZOU	Complete in June 2015	Yes	Yes	Yes	Yes	1.A
Major CIP and TIM Fee Update	Complete in early 2016	Yes	Yes	Yes	Yes	1.A
Annual CIP Update	Ongoing; next update due June 2015	Yes	Maybe	Yes	Yes	1.B
Biological Resource Policies Update	Complete in mid 2016	Yes	Yes	Yes	Maybe	1.B
Sign Ordinance Update	Complete in May 2015	Yes	Yes	Yes	No	1.B
Mid-Year CIP Update	Ongoing; next update due March 2015	Yes	Maybe	Yes	No	2
Meyers Area Plan	TBD	Yes	Yes	No	Maybe	2
General Plan 5 Year Review	Ongoing; work will begin mid 2015	Yes	Maybe	Yes	Yes	2
General Plan Implementation - Key Projects						
Update Design Improvement Standards Manual (aka Land Development Manual)	TBD	Yes	Maybe	Yes	Yes	2
Infill Ordinance	TBD	No	Maybe	Yes	Yes	3
Scenic Corridor Ordinance	TBD	No	No	Yes	Yes	3
Community Planning	TBD	No	Maybe	Maybe	Yes	3
Cultural Resource Preservation Ordinance	TBD	No	No	Yes	Yes	3
General Plan Amendment to Contract Community Region Boundary Lines	TBD	Maybe	No	Maybe	No	4
MC&FP Phase II	TBD	Maybe	Yes	No	Maybe	4

RECOMMENDED BOARD ACTION

- Endorse a final matrix or list that prioritizes all County-initiated land use and transportation projects managed by LRP and direct staff to return to the Board every six months to provide an update;
- Adopt the draft Resolution of Intention;
- Discuss funding for processing this project as part of the FY 2015/16 budget, and;
- Determine Project's priority and preferred method processing based on staff and funding availability.

Small Water System Program

The Small Water System Program is involved with the permitting, inspection, and monitoring of 175 small public water systems. The County is the Local Primacy Agency, under contract with the State Department of Health Services, to perform the program requirements that are specified in State and Federal Regulations. The purpose of the program is to ensure that small water systems deliver safe, adequate, and dependable potable water. Environmental Health reviews new applications and changes of ownership to verify that the system will be able to meet technical, managerial, and financial capabilities.

Declaration of Small Water Systems Status

Definitions for Small Water Systems

Sampling Requirements:

- Community Water Systems using a Groundwater Source
- Community Water Systems using a Surface Water
- Non-Transient / Non-Community Water Systems Using a Groundwater Source
- Non-Community Water Systems Using a Groundwater Source
- Non-Community Water Systems Using a Surface Water Source

Instructions for Taking Water Samples

Laboratories Approved for Drinking Water Analysis

Operating Requirements:

- Bacteriological Sample Siting Plan Requirements
- Bacteriological Sample Siting Plan
- Annual Consumer Confidence Reports
    - State guidelines and templates/forms
- Water Quality Emergency Notification Plan for Small Water Systems

Fee Schedule

Coliform Bacteria Contamination-"What is coliform bacteria and why is it harmful?"

Water Quality Frequently Asked Questions

Chapter 3
Existing Water Supply and Policy

3.1 INTRODUCTION

This chapter presents an overview of existing water supplies, rights and permits, and contracts available to El Dorado County's water purveyors and others. Details were obtained from available reports and interviews with water purveyor and County personnel. This chapter also describes the various state and federal policies that regulate the use of these water sources.

3.2 EL DORADO COUNTY WATER AGENCY

The Water Agency holds no water entitlements at this time. The Agency is working with the U.S. Bureau of Reclamation (USBR) to secure 15,000 acre-feet of water from Folsom Lake as authorized under Public Law (PL) 101-514 and then will transfer that water through contracts with El Dorado Irrigation District (EID) and Georgetown Divide Public Utility District (GDPUD). The Water Agency, in its role with the El Dorado Water and Power Authority (EDWPA), has also taken the lead in negotiating the SMUD Cooperation Agreement, which allows use of SMUD's Upper American River Project to develop a water supply of up to 40,000 AF and is currently pursuing water rights in association with this project. These supplies will be discussed in more detail in Chapter 5.

3.3 EL DORADO IRRIGATION DISTRICT

The EID water supply is by far the most complex of the systems in El Dorado County and comes from a variety of sources. The following general descriptions of these sources and the accompanying figures and tables are taken primarily from the District's draft *Water Supply Master Plan*[1] but have been reviewed and updated by EID staff for purposes of this report. The approximate location of each source is shown in **Figure 3-1**, and diversion rates, storage amounts, and other water rights information are summarized in **Table 3-1**.

1 See Appendix A (Bibliography), No. 1

N/A Not Applicable

[a] The combined supply of 7,550 acre-feet per year is diverted by pump from Folsom Lake to the El Dorado Hills water treatment plant with a current capacity of 19.5 mgd. This water is then treated and distributed in the El Dorado Hills service area.

[b] Reservoir capacity at full pool is 41,000 acre-feet, including dead storage of 480 acre-feet and an allowance of 1,000 acre-feet for sedimentation. The reservoir is operated as two years of storage, with treated water released through the Camino Conduit to Reservoirs 2, and through the Pleasant Oak Main to Reservoir A.

[c] In addition to the 500 cfs Camp Creek diversion, EID has rights to 12.5 cfs based upon pre-1914 water rights for diversions from Camp Creek at the Camp Creek segment of the Crawford Ditch. When Sly Park Dam was constructed, the point of diversion for these rights was moved upstream from the Camp Creek Ditch, to the diversion dam at the inlet to the Camp Creek tunnel to Jenkinson Lake.

[d] In October of 1999, the Pacific Gas & Electric Company transferred the water rights for both power generation and consumptive uses to EID for the FERC Project 184. This project includes reservoirs and associated dams, canals, a powerhouse and other facilities. The original water rights claim is dated 1856.

[e] Diversions are made between April and November each year to meet customer demands on the North Fork Extension and Camp Creek segment of the Crawford Ditch. Tail water flows can also be used to supplement the Clear Creek segment of the Crawford Ditch when available.

[f] Diversions are made year round into the Crawford Ditch from Clear Creek when available. Supplemental water is also released from Jenkinson Lake into Clear Creek for aesthetic flow purposes (by agreement with homeowners), which are recaptured at Clear Creek diversion dam to meet Crawford Ditch irrigation demands. A 0.5 cfs bypass flow below the diversion dam is now maintained as of 2005.

[g] Water is released into Squaw Hollow Creek from the end of the Crawford Ditch to supplement natural creek flows diverted to the East Diamond Ditch to serve irrigation customers.

[h] The natural flows of Weber Creek are rediverted at Folsom Lake through a Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to pre-1914 rights.

[i] EID historically made direct diversions from Slab Creek to the Summerfield Ditch to supply irrigation customers. Since 2003, EID has rediverted this water at Folsom Lake through a Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to pre-1914 rights. ,

[j] EID makes direct diversions from the South Fork American River by pump. Upgraded water treatment facilities and a 200,000-gallon water storage tank were installed in 1994 to improve water quality and supply reliability. Direct diversions are no longer made from the unnamed spring and stream because of the unreliability of the water supply and water quality.

[k] Direct diversions were historically made from Hangtown Creek into the Gold Hill Ditch at the west end of Placerville. Since 2003, EID has rediverted this water at Folsom Lake through a Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to pre-1914 rights.

[l] The Bass Lake storage is used to supplement the recycled water system during peak summertime demands. Potable water from EID's nearby piped system is used to fill Bass Lake as needed, but is normally scheduled when Jenkinson Lake is full and spilling.

[m] In 2001, EID received consumptive water right for 17,000 acre-feet of FERC Project 184 water to be taken at Folsom Reservoir.

- **Folsom Lake.** This water supply is based on 1968 El Dorado Hills and 1958 Lake Hills contractual entitlements with the USBR. Through current water service contracts with the USBR for Folsom water, EID is entitled to 7,550 acre-feet per year.

- **Jenkinson Lake (Sly Park Unit of the Central Valley Project)**. This project is based on a 1953 USBR contractual entitlement (Water right application numbers 13707 and 13708). EID and the USBR renewed this contract for the purchase of water from Jenkinson Lake. In late 2003, EID completed the transfer of the Sly Park Unit and acquired Jenkinson Lake from the USBR. Federal legislation authorizing the transfer was signed into law in October of 2000 by President Clinton. EID is no longer bound by the USBR contractual limits on operation of the facility and now holds the water rights.

- **South Fork American River and Project 184 Reservoirs.** These sources supply the existing FERC 184 Water Project. This supply is delivered by the El Dorado Canal and Forebay for diversion into the EID Main Ditch for subsequent treatment at the Forebay Water Treatment Plant. The water was formerly purchased under a contract with Pacific Gas & Electric (PG&E) and its predecessor Western States Gas and Electric Co. In 1999, PG&E transferred the water rights for both power generation and consumptive uses to EID.

- **North Fork Cosumnes River, Clear Creek and Squaw Hollow Creek.** EID retains pre-1914 water rights for direct diversion from North Fork Cosumnes River, Clear Creek and Squaw Hollow Creek for serving the Crawford Ditch System.

- **Middle Fork Cosumnes River**. EID holds a 1933 appropriative water right for direct diversion from the Middle Fork Cosumnes River serving the Outingdale Subdivision.

- **Weber Reservoir**. EID holds a 1920 appropriative water right for storage in Weber Reservoir.

- **Weber Creek.** EID retains a pre-1914 water right for direct diversion from Weber Creek. Since 2003, EID has rediverted this water at Folsom Lake through a temporary Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to the pre-1914 right.

- **Slab Creek**. EID retains a pre-1914 water right for direct diversion from Slab Creek. Since 2003, EID has rediverted this water at Folsom Lake through a Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to the pre-1914 right.

- **South Fork American River and Unnamed Spring and Stream.** EID retains prescriptive and riparian rights for direct diversion by pump from South Fork American River, as well as a 1947 appropriative water right for direct diversions from an unnamed stream and an unnamed spring.

- **Hangtown Creek**. EID retains a pre-1914 water right for direct diversion, first used by a predecessor to EID during the 1850s. Since 2003, EID has rediverted this water at Folsom Lake through a Warren Act Contract with the USBR for use in El Dorado Hills, pursuant to the pre-1914 right.

- **Bass Lake Reservoir.** EID retains a pre-1914 water right for collection of the surrounding watershed, tributary to Bass Lake. Water was first used at this site in 1866.

- **Recycled Water.** Recycled water from the El Dorado Hills reclamation plant has been used for industrial purposes and golf course irrigation since 1979. Recycled water has been used from the Deer Creek reclamation plant for golf course, landscape, and road median irrigation since 1994. A noteworthy accomplishment has been the use of recycled water for residential landscape irrigation in both front and backyards in El Dorado Hills since 1998. Currently, EID supplies over 3,000 acre-feet of recycled water and plans to provide approximately 7,000 acre-feet by 2020.

- **South Fork American River and Project 184 Reservoirs**. In 1991, EID and the El Dorado County Water Agency jointly submitted an application for diversion and consumptive use of 17,000 acre-feet of water from Project 184. In 2001, EID received Water Right Permit No. 21112 allowing additional water to be diverted from Folsom Lake for consumptive purposes, subject to certain terms and conditions. In 2006, an Appellate Court affirmed a lower court decision in favor of EID, ruling that Term 91 could not be applied to restrict the use of the 17,000 acre-feet. The USBR has not yet executed a long term Warren Act Contract to allow EID to access this water.

Actual water availability is not equal to the sum of all water entitlements. Several factors influence water availability from EID’s entitlements such as use history, infrastructure constraints, and seasonal diversion and storage policies. Firm yield for EID’s water supply has been established through computer modeling and is defined as the yield that the integrated supply system can reliably deliver in 95 percent of the years, while incurring shortages in no more than 5 percent of the years. In 2006 EID adopted a supply based system firm yield of 60,550 acre-feet per year. The infrastructure constrained firm yield is 47,000 acre-feet. Safe yield is estimated by this Water Resource Plan at 58,753 acre-feet per year.

3.4 GEORGETOWN DIVIDE PUBLIC UTILITY DISTRICT

GDPUD’s source of water is the Stumpy Meadows project. The reservoir, built in 1962, has a capacity of 20,000 acre-feet and a firm yield of 12,200 acre-feet. Safe yield is estimated at 10,500 acre-feet. Components of the Stumpy Meadows project include:

- **Pilot Creek –** GDPUD holds a Pre-1914 water right to divert and store water from Pilot Creek
- **Pilot Creek –** GDPUD retains a Post 1914 appropriative water right to divert and store water from Pilot Creek
- **Mutton Canyon –** GDPUD retains a Pre-1914 water right to divert water and store water from Mutton Canyon
- **Bacon Canyon –** GDPUD retains a Pre-1914 water right to divert water and store water from Bacon Canyon
- **Deep Canyon –** GDPUD retains a Pre-1914 water right to divert water and store water from Deep Canyon
- **Structure 2 –**GDPUD holds a Pre-1914 water right to divert water and store water from an un-named tributary to Pilot Creek
- **Structures 3-7 –** GDPUD holds a Post 1914 permit to divert water from five un-named tributaries to Pilot Creek
- **Otter Creek –** GDPUD holds a Post 1914 permit to divert water from Otter Creek
- **Onion Creek –** GDPUD holds a Post 1914 permit to divert water from Onion Creek

Firm yield for the GDPUD water supply was established through modeling and is defined as the yield that the integrated supply system can reliably deliver in 95 percent of the years, while incurring shortages of no more than 10 percent annually for domestic service and 50 percent for untreated water in 5 percent of the years. GDPUD has adopted a system firm yield of 12,200 acre-feet per year. Safe yield is estimated to be 10,500 acre-feet per year.

3.5 GRIZZLY FLAT COMMUNITY SERVICES DISTRICT

GFCSD's current water supply comes from Big Canyon and North Canyon, two surface water tributaries in the North Fork Cosumnes River Basin. Use of this water is allowed under a pre-1914 water right for the direct diversion of available flows from these two streams, at two points of diversions into the Eagle Ditch. The two streams are fed by seasonal rainfall and snowmelt and are also part of a spring-fed system.

At the head of the supply system, below the confluence of North Canyon and an unnamed tributary a diversion conveys water into the upper reach of GFCSD's Eagle Ditch. At the tail end of the upper reach, flow from Big Canyon is diverted into the system and the combined flow is conveyed through the lower reach of the Eagle Ditch to the District's raw water storage reservoir. An adjacent water treatment plant treats the water and releases it into the distribution system for the Grizzly Park subdivision.[3]

The firm yield of the direct diversions which could be conveyed to the water treatment plant was calculated by estimating the quantity of direct diversion, through hydraulic analysis, available to Grizzly Flats CSD, including the reservoir seepage loss, the monthly water use distribution, and evaporation loss. Based on this analysis in the 1998 Borcalli report[3], the safe yield of direct diversions conveyed to the water treatment plant was calculated to 143.5 acre-feet per year.

The District was issued two permits by the State Water Resources Control Board (SWRCB) on August 18, 1989 (Permit 20357 and Permit 20358). Permit 20357 authorizes the District to divert water from an unnamed tributary to the Steely Fork of the Cosumnes River, the total not to exceed 3 acre-feet per year from November 1 through June 15. According to the Borcalli Report (1998), this water flows from Grizzly Creek into Porters Pond for fire suppression purposes. Questions have been raised regarding contamination of this water from septic systems located near the pond. There are currently no facilities to treat this water.

Figure 3-3
Grizzly Flats Community Services District, Water Supply Projects

Permit 20358 authorizes GFCSD to divert water to storage from North Canyon and Big Canyon. The water appropriated under this permit is not to exceed 31 acre-feet per year and is to be collected between November 1 and June 15. This permit is understood to be for diversion to storage rather than for consumption and, therefore, is more than adequate to allow for seasonal storage in the existing raw water reservoir with its active capacity of about 15 acre-feet.

3.6 SOUTH TAHOE PUBLIC UTILITY DISTRICT

STPUD relies solely on groundwater for its water supply. Starting in 1996, the District detected methyl tertiary butyl ether (MTBE) in one of its wells. Since then, the District has removed 13 wells from service or drastically reduced their pumping rates because of numerous MTBE plumes. Litigation with various petroleum suppliers over the groundwater contamination issue was settled in the District's favor in 2002. As of 2006 the District operates 17 active wells with a nominal capacity of 13,742 gallons per minute (gpm) or 19.79 million gallons per day (mgd). The District's system includes 22 storage tanks with an operational storage capacity of 9 million gallons and 11 booster pump stations with a total maximum pumping capacity of 7,019 gpm.

3.7 TAHOE CITY PUBLIC UTILITY DISTRICT

Until 1989, approximately 60 percent of the District's needs were supplied from Lake Tahoe. The U.S. Environmental Protection Agency (EPA) Surface Water Treatment Rule and other prospective surface water regulations and the attendant costs of their implementation prompted the District to convert their water supply to groundwater. The surface water intakes in the lake are maintained as a standby source in case of emergency.

The District is primarily located in Placer County with the Rubicon System serving the area between Meeks Bay and Bliss State Park in El Dorado County. The Rubicon System supply consists of three wells, a booster pump station, and three steel reservoirs. These facilities are reported to be generally in good condition[2] with some concern expressed for site security and potential fire danger from trees close to the facilities.

The District's Rubicon System facilities include three wells with a total operating capacity of 645 gpm (for two wells; the third is N/A), three storage tanks having a total capacity of 538,000 gallons, and two booster pumps with capacities of 185 gpm each.

2 See Appendix A (Bibliography)

3.8 AGRICULTURE

As stated in the previous chapter, virtually all the agricultural water use within El Dorado County occurs on the western slope, and virtually all of the surface water for agricultural use is supplied by EID and GDPUD and is included in those purveyors' water use figures. Agricultural water use outside of the purveyor service areas is generally supplied from individually owned springs, wells and ponds, and water production and use figures are not readily available.

3.9 OTHER USERS

Water for the non-public water purveyors operating in the portion of the Lake Tahoe area within El Dorado County is supplied by groundwater and all indications are that they will continue to do so in the future. Water production capability figures supplied by purveyors that provided information are as follows:

- **Lukens Water Company:** 2,000 gpm from three active wells,
- **Tahoe Keys Homeowners Association:** 5,000 gpm from three active wells, and
- **Tahoe Swiss Village Utility, Inc.:** 150 gpm from one well.

3.10 GROUNDWATER

Groundwater is the source of supply for the purveyors in the South and West Tahoe areas and indications are that groundwater will continue to provide an adequate supply of water to those areas. Settlement of litigation related to MTBE contamination in South Tahoe will likely provide sufficient funding to treat the contaminated groundwater supplies for domestic use.

On the western slope of El Dorado County, however, groundwater occurs primarily in hard rock. In the County, as in other parts of the Sierra Nevada foothills, alluvium consisting of unconsolidated deposits of clay, silt, sand, and gravel laid down by flowing water occurs only in small areas too thin to provide a significant amount of storage. Thus the amount of usable groundwater is limited. A cooperative study entitled Georgetown Divide Water Management Study prepared by the Department of Water Resources[8] describes water supply alternatives available to the Georgetown Divide area and includes a discussion of the groundwater situation on the western slope. The following is an example from that study.

Many wells are drilled in hard crystalline rock that lies at or near the ground surface or under the thin layers of alluvium. In rock formations, water moves through and is stored in fractures in the rock mass. The width of each fracture usually decreases with depth, causing diminished water flow and storage capacity. The amount of water that can be stored and transmitted in such fractures is generally small compared to the amount that can be held and conveyed in a porous alluvial aquifer.

During the drought of 1976 and 1977, El Dorado County Division of Environmental Health initiated a water well survey canvassing residents with wells in 15 county planning areas. **Table 3-2** lists median depth and estimated production rate for wells in 15 of the planning areas.

Table 3-2
Well Characteristics in El Dorado County

County Planning Area	Number of Wells Surveyed	Median Depth (Feet)	Median Rate (gpm)
Camino-Fruitridge	57	100	5
Cool	29	200	5

Shingle Springs	42	125	4
Somerset/Fairplay/Mt. Aukum	---	---	10
Pollock Pines	10	---	8

Source:Calkins, Carla, *Water Well Survey Report*, June 1978

The survey showed that while many residential wells produced 4 to 10 gallons per minute, many had flow rates less than 1 gpm and some had gone dry. Other reports[6, 7] substantiate the limitation of groundwater as a dependable source of water for supplementing public water supply or augmenting surface water storage during droughts. In fact, the contrary may be true where users of groundwater may look to the Districts for service when their wells go dry during droughts. Surveys also indicate that groundwater quality, though satisfactory in most areas of the western slope, is often marginal. As future development occurs in areas beyond pipeline service, both quantity and quality of groundwater sources could be threatened.

3.11 CALIFORNIA WATER POLICY AND REGULATIONS

This section describes existing regional and statewide water programs being implemented by various water suppliers that are important to recognize in context of the EDCWA water supply plan. The Agency is mindful of these various programs and policies and takes these various programs into consideration when developing the water plan.

This section also presents information on the continuing regulation of both drinking water and wastewater and how these new laws affect or could potentially affect water supply planning.

3.11.1 ASSOCIATION OF CALIFORNIA WATER AGENCIES – THE ACWA BLUEPRINT

ACWA is a statewide non-profit association whose 440 public agency members are responsible for about 90 percent of the water deliveries in California. ACWA is a powerful lobbying organization for the California water community and regularly comments on bills and legislation that could potentially impact their members. ACWA's mission is to assist its members in promoting the development, management and reasonable beneficial use of good quality water at the lowest practical cost in an environmentally balanced manner. The ACWA Blueprint, published in 2005, is an informational document to further educate Californians and elected officials on priority actions needed to sustain the state water supply and economy. The three goals of the ACWA Blueprint are to:

- Find common ground among the diverse voices in the water community and to identify their biggest challenges and agree on actions needed to resolve them;
- Collectively develop a forward-looking action plan for meeting California's future water needs; and
- Create a policy-oriented document that would encourage leaders at the state and federal level to re-engage in water issues and also provide a roadmap for investing California's water future.

The ACWA Blueprint contains 12 primary action plans that their member agencies believe will ensure a safe and reliable water supply for the State. The 12 action plans are:

- Action 1: Improve existing Delta water conveyance system to increase flexibility and enhance water supply, water quality, levee stability and environmental protection in the near term,
- Action 2: Evaluate long-term threats to the Delta levee and conveyance system and pursue actions to reduce risks to the state's water supply and the environment,
- Action 3: Ensure delivery of adequate Colorado River water supplies for Southern California and defend California's water rights on the river,
- Action 4: Implement and fund the Sacramento Valley Water Management Program,
- Action 5: Develop additional groundwater and surface water storage, including proposed surface storage projects that are now under study or are determined to be feasible,
- Action 6: Support and fund efforts to expand recycled water use and implement best management practices for urban and agricultural water use efficiency,
- Action 7: Improve the quality of California's drinking water supplies to safeguard public health and enhance water quality for agriculture and the environment,
- Action 8: Work with local agencies to overcome constraints to developing seawater and brackish groundwater desalination,
- Action 9: Modernize the federal Endangered Species Act,
- Action 10: Expedite Approval Process for voluntary water transfers,
- Action 11: Clarify and expand the state's role in flood control and promote multi-benefit flood control agencies, and
- Action 12: Support Integrated Regional Planning.

EDCWA is a member agency of ACWA and seeks to promote these issues when necessary and appropriate at local and regional levels. Specifically, EDCWA and EDC purveyors are actively engaged in several action steps identified in the ACWA Blueprint. For example:

- This plan identifies new storage reservoirs and water supplies being considered in El Dorado County that will ensure a safe and reliable water supply for residents of the County,
- The El Dorado Irrigation District has supplied recycled water since the 1970’s. In the 1990’s, the system was expanded to residential irrigation and currently the construction of a seasonal storage reservoir is being studied,
- El Dorado County water purveyors employ various best management practices for urban uses. EID and EDCWA both provide irrigation management systems for the County, and
- EDCWA is currently participating in a Proposition 50 Regional Planning Water Grant with the Cosumnes, American, Bear and Yuba River group (CABY).

3.11.2 INTEGRATED REGIONAL WATER SUPPLY PLANNING

California Proposition 50, the Water Security, Clean Drinking Water, Coastal and Beach Protection Act passed by the California voters in 2002 approved the issuance of a bond to add, among other things, $500 million for Integrated Resource Water Management. An IRWM plan is a planning document that identifies broadly-supported goals, objectives, strategies, actions and projects within the region. The intent of the IRWM Grant Program is to encourage integrated regional strategies for management of water resources and to provide funding, through competitive grants, for projects that protect communities from drought, protect and improve water quality and improve local water security by reducing dependence on imported water[38]. The IRWM Grant Program is administered through the DWR and SWRCB. EDCWA is working jointly with other county water suppliers and non-governmental organizations in the CABY Region to submit an implementation grant application to the IRWM grant program.

EDCWA is a participant and a supporter of the CABY IRWMP, which will provide an integrated approach to water management across the region’s four watersheds which include the Consumes, American, Bear, and Yuba, to address long-term water supply needs, protection of water quality, and enhancement of environmental and habitat resources. Based on technical knowledge and endorsed by a united community, the resulting CABY IRWMP actions and projects have significant opportunities to attract local, state and federal grants and other financial support. The CABY group used the Stockholm Environment Institute's Water Evaluation and Planning System (WEAP) model in the preparation of their regional plan. The WEAP framework analyzes climate scenarios, rather than relying upon historical hydrological patterns.

The CABY implementation proposal includes a total of 26 projects that address specific water supply, water quality, groundwater and environmental habitat issues identified in the CABY planning grant application. This proposal signifies the monumental effort of the stakeholders to bring together diverse interests within the region and integrate the individual efforts of organizations that were planning to submit separate Proposition 50 implementation applications. The IRWMP effort was funded by a Proposition 50 planning grant awarded by Department of Water Resources in January 2006 to EID, who administered the $500,000 grant for the region. The Plan was completed in 2006 and will be updated on a regular basis as additional technical analysis is completed and projects are added. This Water Resources Development and Management Plan significantly contributes to the IRWMP process in that it provides a thorough analysis of the water supply gap in El Dorado County which was addressed on a regional basis in the CABY IRWMP.

CABY Projects in El Dorado County

The CABY Implementation Proposal includes several projects in El Dorado County. These projects involve capital improvements, education and outreach programs, water efficiency/conservation studies, and environmental restoration and preservation. The projects are described below:

El Dorado Irrigation District

Junior High School Water Efficient Landscape Education Program – This program will involve students in 6th through 9th grades in water efficient landscape design through installations at their school site;

Caples Spillway Channel Stabilization - The purpose of this program is to stabilize Caples Spillway Channel and protect environmental and watershed resources. Stabilization will indirectly enhance habitat by minimizing erosion and downstream sediment deposits;

Conservation and Increased Agricultural Water Use Efficiency – The purpose of this project is to expand EID's irrigation scheduling system for commercial agriculture throughout the CABY region. By monitoring evapotranspiration rates, soil types, and moisture levels, an appropriate irrigation schedule will be developed for each grower;

Evapotranspiration Rates measured in the Cosumnes, American, Bear, and Yuba River Watersheds – This project will establish a weather station that will measure evapotranspiration rates throughout the CABY region. These rates then can be used to develop individual irrigation schedules;

Esmerelda Creek Restoration– This project proposes to restore the lower portion of Esmerelda Creek below the El Dorado Canal diversion, making the creek more hospitable for native riparian species;

Recycled Water Infrastructure Expansion – This project will expand EID's current recycled water system to meet current and future community landscape water demands. Expanding the recycled water system will enable EID to preserve more potable water;

Outingdale Water System Improvements Project – The purpose of this project is to correct a deficient water system consisting of an unreliable and damaged diversion dam, unreliable raw water intake, inadequate treatment capacity, inadequate water storage capacity, lack of emergency power, and other system deficiencies. In a joint effort with the EDCWA, this project may also analyze the feasibility of bringing a raw surface water source to the South County for agricultural purposes; and

Regional Wastewater/Recycled Water Development Project - This project involves connecting three wastewater systems (Placerville WWTP, Camino Heights WWTP, and Deer Creek WWTP) for the development of a reclaimed water supply. This project would potentially allow a recycled water supply for the City of Folsom.

El Dorado County Water Agency

Regional Water System Reliability and Conservation Project – This project involves improvements in regional ditch conveyance systems, thereby improving raw water conveyance reliability, eliminating seepage, and minimizing evaporation. Ditches within EID, GDPUD, Nevada Irrigation District and Placer County Water Agency have been identified for improvement. The project also includes lining of the GFCSD raw water reservoir and monitoring within the distribution system, and

Groundwater Response to Climate Variation – This study will explore the effect of climate variation on groundwater and private wells within the CABY region. The project will include a review of similar studies in the Sierra Nevada foothills, and a long term well monitoring program. This information will also provide a better understanding of the potential for well contamination from leach fields in the CABY region.

Georgetown Divide Resource Conservation District

Finnon Lake Dam Reconstruction Project – This project entails restoring Finnon Lake, which is in a degraded state, to 350 acre-feet. Reconstruction will enhance fish and wildlife habitat and recreational uses.

3.11.3 CALIFORNIA WATER PLAN (CWP)

The California Department of Water Resources is responsible for statewide water supply planning, prepares the State Water plan, and operates and maintains the California Water Project. The CWP provides a framework for water managers, legislators and the public to consider options and make decisions regarding California's water future. The plan, which is updated every five years, presents basic data and information on California's water resources including water supply evaluation and assessments of agricultural, urban and environmental water uses to quantify the gap between water supplies and uses. The plan also identifies and evaluates existing and proposed statewide demand management and water supply augmentation programs and projects aimed at addressing the State's water needs. The goal of the CWP is to meet State Water Code requirements, develop broad support among those participating in California's water resource planning, and provide useful information for the public, water planners throughout the state, legislators and other decision-makers [39].

The EDCWA is part of the Sacramento River Region in the CWP.

3.11.4 CALFED PROGRAM

The CALFED Bay-Delta Program is a unique collaboration among 25 state and federal agencies whose mission is to improve water supplies in California and the health of the San Francisco Bay/Sacramento-San Joaquin River Delta. In 2000, CALFED drafted a 30-year plan described in its programmatic Record of Decision that set forth general goals and laid out a science-based planning process through which they are able to make better, more informed decisions on future projects and programs within their purview. Two years later, the California Bay-Delta Authority was created to oversee the program's implementation and Congress adopted the plan in 2004. CALFED emerged from the water crisis of the 1990s and was shaped by funding crises in the early 2000s. It was seen as an alternative to the costly and time-consuming legal wrangling amongst Delta interests and a way to solve conflicts in the Delta to benefit the system. CALFED has always embodied the most important ideals of government: interagency coordination, collaborative problem solving, and public involvement leading to open and transparent decision-making and accountability.

The California Bay-Delta Authority oversees the implementation of the CALFED Bay-Delta Program for the 25 state and federal agencies working cooperatively to improve the quality and reliability of California's water supplies while restoring the Bay-Delta ecosystem. The California Bay-Delta Act of 2003 established the Authority as the new governance structure and charged it with providing accountability, ensuring balanced implementation, tracking and assessing Program progress, using sound science, assuring public involvement and outreach, and coordinating and integrating related government programs.

The Bay-Delta Plan is a balanced, comprehensive approach to reduce conflicts over limited water supplies and to address the Program's four objectives through 11 major program elements:

- Water Management
- Water Storage
- Water Conveyance
- Water Use Efficiency
- Water Transfers
- Environmental Water Account
- Watershed Management
- Water Quality
- Ecosystem Restoration
- Science
- Levee Integrity

Of the many program elements, Water Storage, Conveyance, Use Efficiency and Water Management are of primary relevance with regard to EDCWA and El Dorado County western slope purveyors plans. Water Storage and Conveyance are discussed in the Project Water Supply Needs chapter of this report. Additional information on Water Use Efficiency and Water Management on the state level is provided in the following sections. Information specific to water use efficiency and management programs in El Dorado County is provided in the Chapter 9, Water Efficiency.

3.11.5 WATER USE EFFICIENCY

Through competitive processes that will fast-track water conservation and recycling projects, the CALFED Bay-Delta Program aims to generate significant water supply, water quality and ecosystem benefits in the short term by:

- Reducing water demand through "real water" conservation;
- Improving water quality by altering volume, concentration, timing and location of return flows; and
- Improving ecosystem health by increasing in-stream flows where necessary to achieve targeted benefits.

Some of the accomplishments of the program include:

- $13.3 million in water conservation grants and loans for 65 projects in 2001—including 37 urban and 28 agricultural projects. These projects were geographically diverse and were matched with over $9.1 million in local funding.
  - Urban projects range from a voucher incentive program for clothes washers to more efficient landscape water programs
  - Agricultural projects range from canal lining to buried drip irrigation

  Funded projects will collectively save 30,000 acre-feet of water, improve water quality, and save energy. These projects include:

- Two water recycling grants;

- Establishment of 60 out of 200 quantifiable objectives for agricultural water use efficiency actions (on track to develop 30 more by 2003);
- Assembly of an Independent Review Panel to assist in developing a definition of appropriate water measurement;
- Successful negotiation of a cooperative agreement with the Agricultural Water Management Council, U.S. Bureau of Reclamation and California Department of Water Resources to support locally cost-effective agricultural water conservation;
- Creation of a foundation for establishing a Water Use Efficiency Public Advisory Committee, an approach to WUE monitoring, and Urban BMP Certification;
- Development of a draft agricultural WUE milestones as part of overall assurances framework; and
- Initiation of an effective water use efficiency team with key CALFED agencies.

El Dorado County Irrigation District has received numerous grants for water efficiency projects and programs. These grants include $175,000 in USBR grant funding support for 36 water use efficiency projects between 1995 through 2006; $230,000 in DWR funding support for four (4) water use efficiency grant projects 2002 through 2006 including Prop 13 funds for a Low- Income Toilet Voucher/Rebate Project and a Large Landscape Incentive Program and Prop 50 funds for IRWMP and CII/Multi-Family Sub-metering and ET Controller Project; $128,000 in NRCW funded support for one agricultural soil moisture monitoring project; $6,000 in EDCWA funding support for two projects.

3.11.6 WATER MANAGEMENT PROGRAM

The CALFED Program encompasses an array of projects and approaches to expand water supplies and ensure efficient use of the resource. The Program has identified actions that could increase California water supplies by nearly three million acre-feet over the next 10 years, which is enough water to meet the needs of 6 million families annually. The primary goals of the program are to:

- Maximize use of available water supplies through conservation, water recycling, and water quality improvements;

- Increase the flexibility of water systems at the state, federal and local level through improvements in conveyance, storage and water project operations; and
- Develop groundwater and surface water storage projects to boost flexibility and provide additional supplies for agriculture, urban and environmental use.

3.11.7 URBAN WATER MANAGEMENT PLANNING

El Dorado County water purveyors are engaged in many activities that support the State's overall Water Management Plan goals. Conservation water recycling and conveyance improvements are discussed in Chapter 9 and surface water storage projects are discussed in the Water Supply Needs chapter of this report. In large urban areas, the California Department of Water Resources requires each water provider to prepare an Urban Water Management Plan (UWMP), which describes programs and policies to ensure a reliable water supply for their service area. All urban water suppliers in the State of California are required to prepare an UWMP and complete updates every five years on or before December 31. As defined by California Water Code Section 10631, an urban water supplier is defined as a provider that is either privately or publicly-owned, that serves at least 3,000 customers or supplies more than 3,000 acre-feet of water annual on a wholesale or retail basis. Urban water management programs typically require the following elements: description of the water supply, water supply reliability, water demand management measures, water shortage contingency plans, and water recycling and water service reliability. The UWMP includes a variety of nonstructural measures to improve operations and water use efficiency. EID, GDPUD, TCPUD, STPUD and the City of Placerville are required to prepare UWMPs. Additional information regarding El Dorado County purveyors' urban water management planning is provided in Chapter 9, Water Efficiency.

3.11.8 WATER QUALITY REGULATIONS

The Clean Water Act and Safe Drinking Water Act are the primary laws governing the use and treatment of water and wastewater. The Clean Water Act regulates the discharge of wastewaters to waters of the US to ensure protection of the biological and chemical integrity of the nation's water supplies. In California, the Porter-Cologne Water Quality Control Act is the primary regulation protecting groundwater from discharge of wastes. The Safe Drinking Water Act, enacted in 1974, sets standards for acceptable levels of constituents in finished drinking water. As such, the programs and regulations from these laws can have direct impacts on water resources managers throughout the county. This section provides brief overviews of these important laws.

Clean Water Act

Waters of the United States are regulated by the Clean Water Act (33 USC 1344). Generally, the Clean Water Act provides the basis for regulations of pollutant discharge to waters of the U.S., and established the National Pollutant Elimination System (NPDES). Specifically, it prohibits the discharge of any waste into surface waters without a permit, requires the establishment of water quality standards for contaminants, and grants authority to the U.S. Environmental Protection Agency (EPA) to implement pollution control programs. The EPA has delegated the authority to administer and enforce the Clean Water Act and the NPDES to the State of California.

Porter Cologne Water Quality Control Act

The State of California established the State Water Resources Control Board (SWRCB), under which there are nine Regional Water Quality Control Boards, through the Porter-Cologne Water Quality Control Act (Porter-Cologne). Through the enforcement of the Clean Water and Porter Cologne acts, the SWRCB determines the beneficial uses of the waters (surface and groundwater) of the state, establishes narrative and/or numerical water quality standards, and initiates policies relating to water quality. The SWRCB and more specifically, the RWQCB is authorized to prescribe Waste Discharge Requirements (WDRs) for the discharge of waste, which may impact the waters of the State. Furthermore, the development of water quality control plans, or Basin Plans, are required by Porter-Cologne to protect water quality.

Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) authorizes the U.S. Environmental protection (EPA) to protect the nation's drinking water supplies using three methods: (1) developing and enforcing national primary and secondary drinking water regulations; (2) promulgating underground injection regulations to protect sources of drinking water; and (3) developing groundwater protection grant programs. The SDWA permits these activities to be implemented by the states. In California, the California Department of Health Services is the state agency empowered to oversee SDWA requirements. It is important to note that the SDWA does not regulate discharges of pollutants into surface water even though these activities might eventually affect drinking water supplies. These activities are regulated by the Clean Water Act, which was previously discussed. In order to implement National Primary Standards, the EPA established Maximum Contaminant Levels or (MCLs) for each chemicals of concern. These MCLs are the maximum concentration of a chemical allowed in a public drinking water system.

3.12. EXISTING AND FUTURE REGULATORY/ INSTITUTIONAL ISSUES

3.12.1 EXISTING WATER SUPPLY PLANNING REQUIREMENTS (SENATE BILLS 610 AND 221)

SB 610 and 221 were passed to ensure land use planning agencies evaluate water supply availability when approving major urban development projects in California.

SB 610 made changes to the Urban Water Management Planning Act to require additional information in Urban Water Management Plans if groundwater is identified as a source available to the supplier. The information required includes a copy of any groundwater management plan adopted by the supplier, a copy of the adjudication order or decree for adjudicated basins, and if non-adjudicated, whether the basin has been identified as being overdrafted or projected to be overdrafted in the most current California Department of Water Resources (DWR) publication on that basin. If the basin is in overdraft, that plan must include current efforts to eliminate any long-term overdraft. A key provision in SB 610 requires that any project subject to the California Environmental Quality Act supplied with water from a public water system provide a specified water supply assessment, except as specified in the law.

SB 221 prohibits approval of subdivisions consisting of more than 500 dwelling units unless there is verification of sufficient water supplies for the project from the applicable water supplier(s). This requirement also applies to increases of 10 percent or more of service connections for public water systems with less than 500 service connections. The law defines criteria for determining "sufficient water supply" such as using normal, single-dry, and multiple-dry year hydrology and identifying the amount of water that the supplier can reasonably rely on to meet existing and future planned uses. If used for the project, rights to extract additional groundwater must be substantiated.

3.12.2 El Dorado County LAFCO Municipal Service Review

The El Dorado County LAFCO is currently preparing a municipal services review for water supply, wastewater and power as required by state law. Before the Commission can update its sphere of influence, state law requires municipal service reviews for all service agencies in the county. There are over 25 different types of services in the County and LAFCO has completed and adopted one review and has a second out for public review. The intent is to ensure that county residents have reliable service from water, power and other services in the county prior to expanding their SOI.

3.12.3 Future State and Federal Regulations

History has shown that state and federal regulations related to safe drinking water, protecting the environment and water quality continue to evolve and have generally become more complex and protective over time. New drinking water standards for protection of public health may require additional treatment processes by the water suppliers. New research in the wastewater field may create the basis for regulation of new compounds such as pharmaceuticals, personal care products and others that are not currently regulated today that will add to the complexity of reuse and recycling of treated wastewater that is an integral part of the water supply solution. It is reasonable to assume that new regulations or revised regulations with more stringent requirement or standards will continue to be implemented and enforced that will impact all water purveyors. As such, the plan of actions proposed in the water plan will need to adjust accordingly to address the new future regulations

Acknowledgements

The authors of this document wish to thank the organizations and local water purveyors that provided practical assistance in the preparation of this update including the El Dorado Irrigation District, Grizzly Flats Community Services District, Georgetown Divide Public Utility District, the County of El Dorado and agricultural interests within the county.

We would also like to acknowledge those individuals who have provided various levels of peer review and/or input on this document, in particular:

Cindy Megerdigian, Water and Hydro Engineering Manager, El Dorado Irrigation District
Brian Mueller, Director of Engineering, El Dorado Irrigation District
Sharon Fraser, Conservation Coordinator, El Dorado Irrigation District
George Sanders, Interim General Manager, Georgetown Divide Public Utility District
Jodi Lauther, General Manager, Grizzly Flats Community Services District
Dave Defanti, Assistant Director, Community Development Agency, El Dorado County
Steve Pedretti, Community Development Director, El Dorado County
Charlene Carveth, Agricultural Commissioner, El Dorado County
Doug Leisz, El Dorado County Citizens for Water and local farmer
Kirk Taylor, Irrigation Management Consultant and local farmer

Executive Summary

The El Dorado County Water Agency Act [Stats. 1959, c. 2139, p. 5084, and codified as Chapter 96 of the California Water Code Appendices] (Act) created the El Dorado County Water Agency (EDCWA and/or Water Agency) in 1959. Section 96-11 of the Act authorizes the Water Agency to do "…any and every lawful act necessary in order that sufficient water may be available for any present or future beneficial use or uses of the lands or inhabitants" of El Dorado County (County). To enable the Water Agency to discharge this responsibility, Section 96-17 of the Act authorizes the Water Agency to make technical and other necessary investigations, measurements, data collection and make studies and analyses pertaining to water supply and uses of water in the County.

With the adoption of the voter approved 2004 General Plan following two decades of rapid growth in the county, the Water Agency began the preparation of its 2007 Water Resources Development and Management Plan (2007 WRDMP). The 2007 WRDMP examined and summarized the adequacy of existing and planned future public water supplies of the County, including its West Slope region, to meet projected future demand, based on the land use densities (also known as "build out" conditions) in the 2004 General Plan. A stated goal of the 2007 WRDMP was to coordinate water planning activities within the West Slope and to provide a blueprint for actions and facilities that could be needed to meet those projected future water needs.

Since completion of the 2007 WRDMP, new information has become available, including:

- Recent water demand and supply reports
- Changes in recent development patterns
- Changes in future proposed land use
- Recent and proposed General Plan amendments
- Changes in actual and planned water purveyor service area (Service Area) boundaries
- Ongoing conservation efforts
- Two recent severe drought events (2007-2009 and 2012-present)
- A severe recession that temporarily depressed water use
- Further findings of climate change occurring within the Sierra Nevada watersheds of the American and Cosumnes Rivers

In addition, the State has adopted:

- New water conservation requirements for urban retail water suppliers (e.g., SB X7-7)
- New codes and regulations (i.e. CalGreen Building Codes)
- Guidance provided by California Department of Water Resources and other state agencies on planning for impacts due to climate change (http://www.climatechange.ca.gov/).

These requirements and the availability of new information provide a timely opportunity to update the water demand projections in the 2007 WRDMP. Also, the potential effects of climate change warrant consideration, including important public policy issues for long-range water resources planning, and the potential for substantive impacts to water demand and supply.

ES-1 REPORT ORGANIZATION AND ASSUMPTIONS

This report, the 2014 Update, is organized by the following chapters:

- Chapter 1: Background on the 2007 Water Resources Development Master Plan
- Chapter 2: New Information Developed Since the 2007 WRDMP
- Chapter 3: Assumptions for Water Demand Projections
- Chapter 4: Demand Projections
- Chapter 5: Water Use Efficiency
- Chapter 6: Water Supply Need
- Chapter 7: Conclusions
- Chapter 8: References
- Appendices with supplemental technical information

This 2014 Update includes projections of future water demand for West Slope water purveyors, for the year 2030 and build-out conditions, which were estimated for low, medium, and high growth rate scenarios. The 2030 timeframe is used to be consistent with other contemporaneous studies and reports, such as urban water management plans, which may be compared with the projections in this analysis. Build-out conditions, in which the maximum density of land uses permitted under the 2004 General Plan have been achieved, are also included. This update does not include a new land use analysis. Projections are based on 2004 General Plan and 2007 Floor Area Ratio (FAR) General Plan Amendment housing and employee/jobs projections (included in Appendix B and Appendix C) used for the 2007 WRDMP. Urban water demand factors are from recent studies prepared by each purveyor for its service area with appropriate adjustments to account for increased economic activity allowed under the General Plan.

This 2014 Update also includes a discussion of current and potential future water conservation measures that could be implemented to further reduce projected demand. Finally, a summary of each purveyor's water supply portfolio, which vary based on water year type, and a comparison with estimated future demand is presented to identify the potential need for additional water supplies.

As a foundation for the analysis of supplies and demands, a discussion of historic population growth rates, residential and commercial development levels, agricultural water use, groundwater reliability and water use efficiency is included to provide context for the assumptions made in this 2014 Update. Specifically: (1) long term historical growth rates support future growth rate assumptions; (2) projected increases in economic activity in the County may result in higher water use per capita at buildout conditions; (3) changing agricultural crop mix will affect agricultural water use; (4) ground water reliability will influence how development outside public water supply areas will occur; and (4) additional water use efficiency could reduce the long term, new water supply needs in the County .

ES 1.1 Growth Rates

Figure ES-1 provides historical population growth within El Dorado County as compared to average statewide growth. West Slope population growth compared to the county as a whole is also provided in **Figure ES-2.** As shown in Figure ES-1, El Dorado County has grown faster than the state average since 1980. For the 1980 to 2010 period El Dorado County population growth of 2.4% outpaced the California growth rate of 1.5% while the West Slope experienced higher average annual growth of 2.6% compared to the County as a whole. Higher West Slope growth rates can be attributed to governmental limits on the construction of new homes and gaming industry job losses in the Tahoe Basin, which is included in the El Dorado County total.

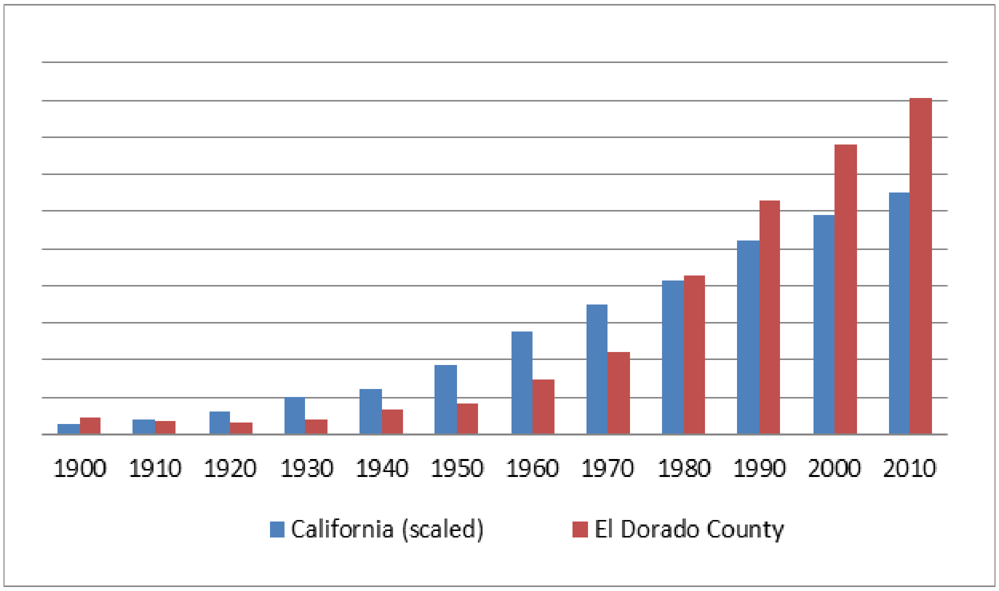

Figure ES-1 El Dorado County and California Population Growth

Figure ES-2 West Slope and El Dorado County Population Growth (1980-2010)
SOURCE: US Census (http://www.census.gov/population/cencounts/ca190090.txt)
West slope growth estimate: EDC (2014) bae worksheets, per Tracey Eden-Bishop, personal communication with N. Porter with El Dorado County (November 25, 2013) and EDC (2002) Land Use Forecast for Draft General Plan, Figure 4

ES 1.2 Economic Activity

According to the 2004 El Dorado County General Plan and 2007 Floor Area Ratio General Plan Amendment, more economic growth, as a percentage of residential growth, is projected under buildout conditions. Even though residential development has outpaced planned commercial development on the West Slope of the County over the past decade.

- **Baseline versus Buildout Potential:** Figure ES-3 shows the ratio of West Slope residential ("households") and commercial ("jobs") land uses in 1999 (2004 General Plan baseline year) and residential and potential commercial land uses allowed under the 2004 General Plan and the FAR General Plan Amendment at buildout. Figure ES-3 illustrates the shifting service area dynamics as water purveyors will be requested to serve more commercial water demand based on planned future development.

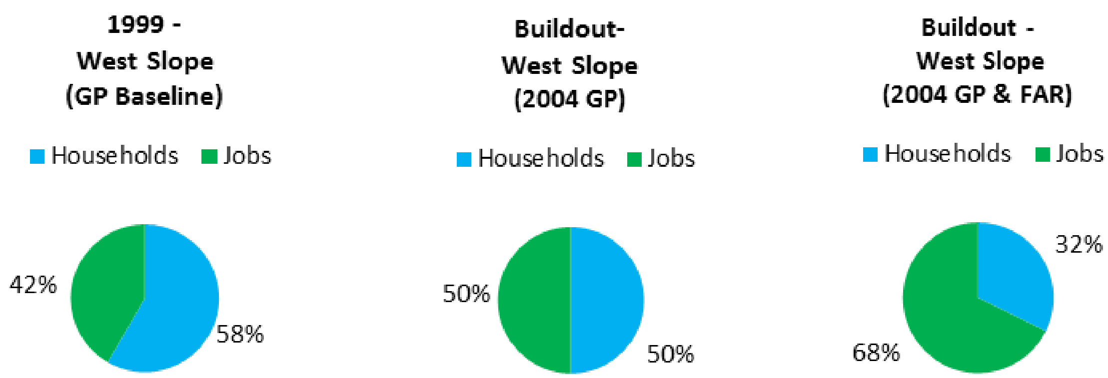

Figure ES-3 West Slope Baseline and Buildout Households versus Jobs

- **2010 versus Buildout Potential:** Estimated development levels in 2010 are represented in Figure ES-4. According to 2010 Census data and Sacramento Area Council of Governments (SACOG) 2010 housing and jobs data, West Slope housing was approximately 55% built-out in 2010 compared to 2004 General Plan buildout household projections. Commercial uses were approximately 32% built-out compared to the 2004 General Plan employee/jobs projections and 15% compared to the 2004 General Plan together with the 2007 FAR General Plan Amendment jobs projections.

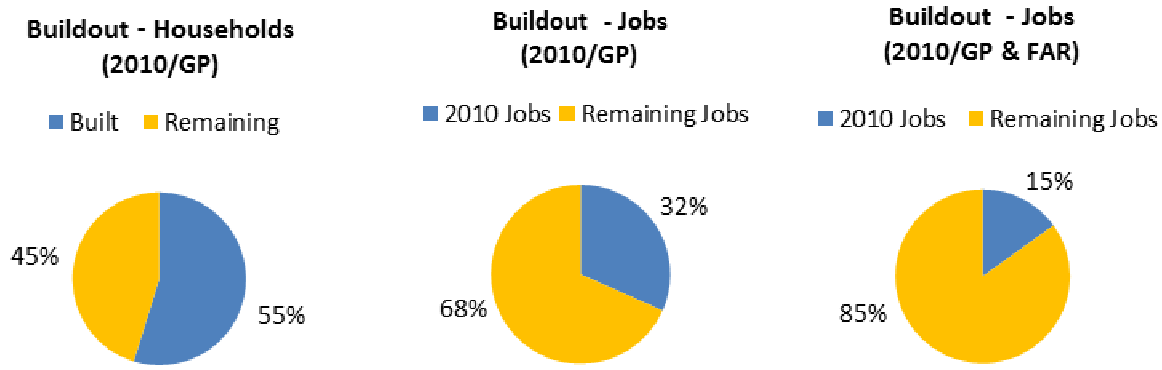

Figure ES-4 West Slope 2010 and Buildout Households and Potential Jobs
SOURCE: EDC (2014) bae March 14,2013 memorandum and worksheets, per Tracey Eden-Bishop personal communication with N. Porter with El Dorado County (November 25, 2013) and EDC (2002) Land Use Forecast for Draft General Plan, Figure 4

It is important to understand relative levels of household and commercial development over time because the State is using per capita water use as a metric in determining compliance with its SB X7-7 water conservation requirements. Urban per capita unit demand factors, a.k.a. gallons per day per capita (GPCD), are calculated by dividing gross water production (including distribution system water losses and all residential, commercial, industrial and institutional (CII) demand) by the total population over multiple years. While the urban water suppliers on the West Slope have plans in place to achieve their conservation goals in the short term (2020), GPCD will necessarily increase slowly over time as more planned economic activity develops within the County. The converse is also true. From Figures ES-3 and ES-4, between 1999 (the 2004 General Plan baseline and the approximate midpoint of the historic period used by EID and GDPUD to calculate GPCD) and 2010, residential development outpaced economic development. While other factors influenced reported water demand reductions during this period (i.e. recession, dry year conditions, rate increases, and rate restructuring), it should be noted that underlying shifts in residential and commercial land uses had the effect of adding more population, relative to jobs, in the near term.

It should be noted, the goal of SB X7-7 was not to curtail economic activity. The codification of the legislation captures the intent to allow for adjustments in GPCD. Water Code §10608.24(d)(1) specifically addresses increases in economic activity in the following manner.

> *"When determining compliance daily per capita water use, an urban retail water supplier may consider the following factors:…*
>
> *(B) Substantial changes to commercial or industrial water use resulting from increased business output and economic development that have occurred during the reporting period."*

ES- 1.3 Agricultural Water Use

Agricultural land and water use in El Dorado County has varied over the last century based on crop mix, water availability and irrigation efficiency. Cultivated acreage in El Dorado County has long been supported with surface water supplies through both ditch systems paid for on a "miner's inch" basis and piped/ metered potable water systems. Ground water has been used to a less extent. Historically, irrigated acreage has been as high as 9,300 acres in 1975, and today there is approximately 5,300 acres under cultivation (up from 4,826 acres in 2000). The decline from 1975 is primarily a result of a decline in irrigated pasture.

El Dorado County was a major grape growing center from 1849 to 1904, with production of 60,000 gallons of wine reported in 1890. The 1890 economic depression, Prohibition, the Great Depression, and a phylloxera pest invasion in the 1930's drastically reduced vineyard acreage, with only a single vineyard reported in 1936. By 1948 there was almost 5,000 acres of deciduous orchard (primarily pears) under cultivation. After pear blight swept through the County, pear production dropped from 52,000 tons to 8,500 tons by 1965. In 1964, Apple Hill was conceived by local agricultural leaders to preserve agricultural lands from conversion to other land uses and a change in plantings to grapes and apples was set in motion. Grapes dominate the crop mix today. A shift away from grapes, however, may be underway as the effects of a new viral disease (red blotch) takes hold in the County. This outbreak could drastically reduce wine grape production, which in turn may result in a return to crops that require more potable water.

Figure ES-5 illustrates the change in County-wide crop mix since the turn of the twentieth century. Year 2000 crop mix is included because it is the baseline year for the 2004 General Plan inventory of cultivated land by water purveyor service area boundary and "Other County Areas" (OCA), which is the basis of this update.

Figure ES-5 El Dorado County Crop Mix – Percent by Acreage

SOURCE: EDC (1948-2013) Agricultural Crop and Livestock Report
Costa (2010) History of Wine Making in El Dorado County
USDI (2008)

These dynamics make projecting future agricultural water demand challenging, since water use varies widely by crop type. To demonstrate the effect of crop type on agricultural water requirements, Figure ES-6 presents three crop mix scenarios for acreage under cultivation in 2000 (baseline) and at buildout: 1) Year 2000 (baseline) crop mix; 2) 100% vineyard with no change in pasture irrigation; and 3) 100% deciduous orchard with no change in pasture irrigation. Water requirements are based on 1.3 acre-feet per acre for grapes, 2.8 acre-feet per acre for orchard and no change in pasture irrigation total from the baseline year.

Assuming 100% vineyard would tend to underestimate agricultural demand while assuming 100% deciduous orchard would overestimate demand. From ES-4, the Year 2000 (baseline) crop mix represents a balance between grapes with a lower water requirement and deciduous orchard with a higher water requirement. For this analysis, therefore, the baseline year crop mix is assumed in projecting future agricultural water demand, except that acreage in pasture irrigation is assumed to stay constant. A similar analysis is presented in Chapter 4 for each area/purveyor.

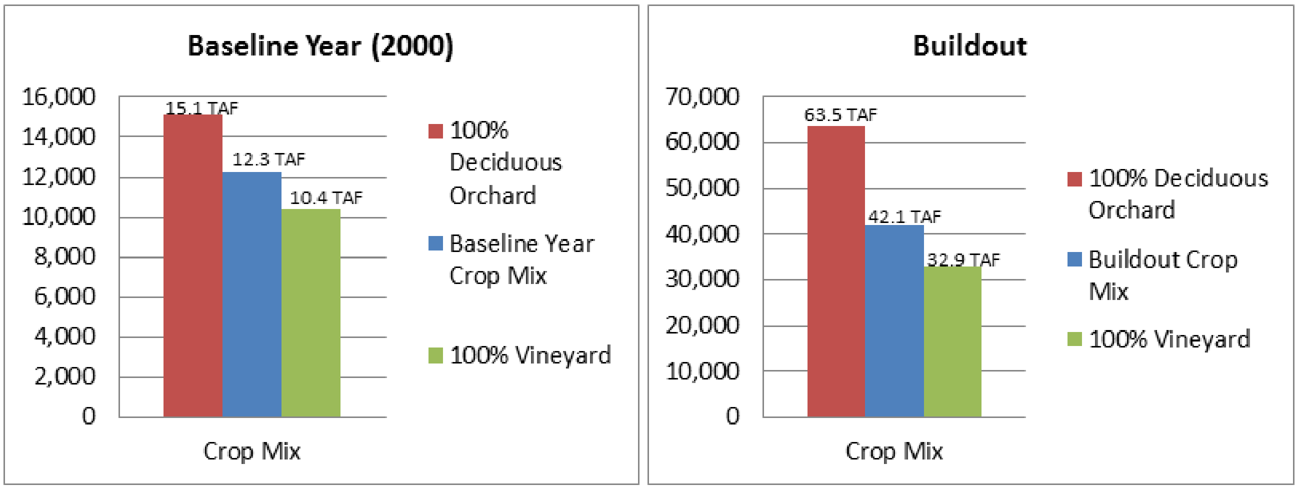

Figure ES-6 Crop Mix Water Requirement for Baseline Year and Buildout
SOURCE: EDC (2004) Appendix E (EPS 2003 and Wood Rogers 2003)
EDCWA WRDMP (2007) Table 4-7
Note: Water requirements do not include system losses, which vary by area/purveyor.

Adaptation to adverse conditions by agricultural growers in the County speaks to the region's favorable agricultural characteristics and resilience through severe economic downturns and pest and disease outbreaks. This adaptability and the following factors contribute to the potential for expanded agriculture land uses in the County:

- General Plan policies that are protective of agriculture and allow ranch marketing by right;
- High price of agricultural land elsewhere makes the County more attractive to producers;
- Crop diversification in the "Apple Hill" area, including apples, cherries, wine grapes, peaches, nectarines and Christmas trees drive ranch marketing operations that draw more than 35,000 visitors to the County each year;
- Total 2013 crop production value in El Dorado County was $57 million, representing a 20% increase from 2012 and up from $53 million in 2000. (EDCDAWM, 2000/12/13); and
- Agriculture and related activities contributed approximately $441 million to the County economy in 2013, of which ranch marketing and value-added products contributed about $222 million, up from $159 million in 2012 and the wine industry $179, up from $169 million in 2012 (EDCDAWM, 2013,2014).

Ensuring adequate water supply for agriculture is critical to a growing vibrant County economy, not only for current levels of cultivation and potential crop mix changes but for expansion of agricultural land use and a crop mix that can adapt to changing agricultural markets and biologically induced declines. El Dorado County's agricultural tourism brings visitors from the Sacramento region and from all over the state. This reflects a broader statewide benefit to supporting Apple Hill and other growers in El Dorado County with a reliable water supply.

ES-1.3 Groundwater Reliability

Groundwater is a vital source of supply for a significant portion of El Dorado County residents and growers within and outside public water purveyor service area boundaries. The Department of Water Resources' 2003 Bulletin 118 characterizes groundwater in the foothills as follows:

> *"Groundwater development in the fractured rocks of the foothills of the southern Cascades and Sierra Nevada is fraught with uncertainty. Groundwater supplies from fractured rock sources are highly variable in terms of water quantity and water quality and are an uncertain source for large-scale residential development."*

Persistent drought and climate change will continue to impact the reliability of foothill groundwater supplies. This is expected to increase demands on public water purveyors supplies through annexations of lands into public water supplier service areas, extensions of service to areas where well production is declining or where wells have failed and through transport of water by truck to existing residents that cannot economically connect to a public water supply system. Each of these scenarios is addressed in the 2014 Update.

ES-1.4 Water Use Efficiency

Water conservation has been and remains an important component of water resources management in the County. Although it is the area of origin for a significant volume of water used in the greater Sacramento region and other areas of the state, El Dorado County itself has limited developed water supplies. As a result, conservation efforts (including metering) have been a high priority since the 1976-77 drought and remain an important component of water resource management in the County. Many areas have been metered since the 1970s and water service on the West Slope of the County is metered today with very few exceptions. Irrigation management services (IMS) have been offered by EID since 1977; the program has substantially reduced agricultural water use and is responsible for saving over 2,000 acre-feet of water each year. EDCWA has been providing IMS for the remainder of the West Slope of the County since 2001. Local urban water suppliers are committed to achieving state mandated conservation and it is assumed the savings will be sustained except for increases resulting from higher levels of economic activity. Given the need for new water supplies to meet the County's needs, EDCWA is investigating options that would decrease demand even beyond State mandated conservation levels. A DWR Integrated Regional Water Management program grant has recently been approved for a County-wide Conservation Plan to identify and evaluate options for further conservation and water use efficiency.

ES-2 2014 UPDATE RESULTS

The updated analysis results in a projected total buildout demand of 149,000 AFY for the Western Slope of El Dorado County. This replaces the 2007 WRDMP projection of 182,000 AFY. The reduction is primarily due to State mandated urban water conservation and reduced agricultural demand projections. The plan to meet the SB X7-7 GPCD reduction requirements includes both implementation of water efficiency Best Management Practices (BMPs), that will reduce demand, and capital improvements that will reduce system losses. The plan to reduce urban demand to meet SB X7-7 requirements is discussed further in Chapter 5, Water Use Efficiency.

Reduced agricultural demand projections result from a reduction in the land area (to only those lands within Agricultural Districts) used to calculate future agricultural water use. Since growers in El Dorado County have already adopted efficient irrigation practices and irrigation management service programs have already been implemented, no additional water conservation is included in the agricultural water use factors used for this update.

Various metrics can be used in assessing water supply availability and adequacy. One standard, **safe yield**, defines the maximum amount of water that can be made available in any year, including the driest year(s) of record. It differs from **firm yield**, which takes into account imposed deficiencies, based on adopted policy, during periods of drought and, therefore, defines an annual quantity that can be met in most, but not all years. Based on these differences, safe yield and firm yield are typically used in water management projections for differing purposes. Safe yield, as the maximum amount of water conceivably available based on all water year types, is more commonly used in long range water supply planning as it is based primarily on water rights, physical constraints, and watershed hydrology. Alternatively, firm yield is used for shorter-term water supply management decision-making. Both are presented below. For this analysis a climate change scenario has also been prepared that suggests that firm yield could look very different in the future and could decrease to near historic hydrologic safe yield levels, confirming that safe yield should be used for long range planning purposes. Results of the climate change analysis are provided in Chapter 6.

The “Medium Growth Rate” scenario projection is used to estimate both intermediate and long term supply needs, and indicates a long term need for additional water supplies. The precise timing of that need will depend on the future West Slope growth rate. An estimated 75 percent of the urban demands in Other County Areas (OCA) not reallocated to El Dorado Irrigation District (EID) or Georgetown Divide Public Utility District (GDPUD) are assumed to be satisfied with individual wells and therefore are not considered in determining water supply need. An estimated 25 percent of that demand is assumed to require access to a public water supply at some time in the future. Agricultural demands, however, are reflected in new water supply need, as meeting this level of water demand may not be possible or sustainable with fractured rock groundwater supplies. The following tables provide an overall summary of the water supply needs based on current and projected demands including urban conservation. Table ES-1 focuses on ***short term water supply management using firm yield*** and generally indicates that all West Slope purveyors have adequate supplies to meet near term projected demand under historic hydrologic conditions and current firm yield policies. At full build-out of the 2004 General Plan, however, approximately 58,000 acre-feet per year (AFY) of additional water supplies could be needed to meet projected demand on the West Slope when considering firm yield supplies. Existing supplies, in ES-1 and ES-2, for EID include 5,600 acre-feet of recycled water (projected to be available before 2035), resulting in a reduction in the need for new surface water supplies by the same amount. Buildout wastewater treatment plant discharges of 6,800 acre-feet are projected to return to the Cosumnes River watershed for downstream uses.

Table ES-2 focuses on ***long term planning using safe yield*** and indicates new supplies are needed for all purveyors at buildout of the 2004 General Plan, with up to 69,000 AFY of additional water supply needed for the entire West Slope.

Note: 1) 25% of Other County Area urban demands and 100% of agricultural demands are included in the "Additional Water Supply Need." 2) 2012 agricultural demands do not include demand supplied from ground water or riparian sources.

The analyses in this report are based on projections of both demand and supply based on a variety of assumptions. This report was completed during a time of substantial uncertainty due to severe drought conditions and an unprecedented curtailment of water rights by the State Water Resources Control Board. In addition, the U.S. Bureau of Reclamation recently imposed severe cutbacks on its water service contracts and record cutbacks to its water right settlement contractors (which were subsequently restored to specific contract limits following late winter rains). There are also significant uncertainties with regard to the specific impacts of climate change to water supply and demand within the County given its reliance on direct runoff and diversions from the American and Cosumnes River watersheds with documented long term declines in Sierra snowpack and more variability in runoff (Department of Water Resources, 2005 California Water Plan). It also appears likely that regulatory mandates will require increased flows entering the Sacramento-San Joaquin Delta, which could impact the reliability of upstream water supplies.

These uncertainties together with the County's reliance on costly pumped supplies from Folsom Reservoir, extremely limited access to groundwater, and limited upstream storage make it imperative to consider all options for increasing water use efficiency and augmenting future water supplies for the West Slope. It is particularly important to explore opportunities to improve the reliability of water supply conditions during prolonged drought.

There are three additional considerations for the future addressed in this 2014 Update. The first is the potential for future, additional water conservation. Urban utilities throughout California are focusing their efforts on meeting the urban water conservation mandates in SB X7-7 by 2020. Conservation efforts are not likely to stop at that point, however, and it is likely that additional conservation efforts will be considered in El Dorado County in the future. Chapter 5 sets forth a number of potential programs, noting that the implementation of any of these programs will be subject to a range of feasibility measures including cost-effectiveness.

A second consideration for the future reflects that the 2014 Update is a significant update to forecasted water demands on the West Slope and that there is value in revisiting data and key assumptions in future updates as more information becomes available (for example, from upcoming updates to urban water management plans which are due July, 2016) and the impacts of future growth are experienced. We are in a time of substantial change, recognizing the emerging concerns related to climate change, the remarkable disruption of the recent prolonged economic recession which followed a time of unprecedented growth, and continued changes in State water policy.

Finally, while not a purpose of this 2014 Update, Chapter 6 notes that there may be value in a specific climate change vulnerability assessment – of both supplies and demands – for the American River Basin supported by all water users reliant on such supplies. This includes all downstream water users (including environmental uses). It is clear that there is a statewide interest in water supplies generated within the American River watershed. As noted in the 2007 report on climate change vulnerability by the California Urban Water Agencies, the combined effects of decreasing water supplies and increasing water demands are serious challenges for the future.

ES-3 KEY FINDINGS

In summary, the key findings of this Update are listed below.

- Under short term water supply management policies, all West Slope purveyors have adequate supplies to meet near term demand under historic hydrologic conditions and current firm yield policies.
- Under long term safe yield planning assumptions, new supplies are needed for all West Slope purveyors at buildout of the 2004 General Plan, with approximately 69,000 AFY of additional water supply needed for the entire West Slope.
- The climate change hydrologic regime scenario confirms safe yield is the appropriate metric for assessing long term water supply need.
- Considering unprecedented water rights curtailment in 2014 and prolonged drought conditions, it is prudent for EDCWA and West Slope purveyors to consider all options for augmenting future water supplies and achieving greater water conservation for the West Slope.
- An American River Basin climate change vulnerability assessment supported by all water users reliant on such supplies may be valuable to understanding potential basin specific impacts.
- An EDCWA Office of Water Efficiency would provide needed leadership and funding to assist water purveyors in meeting existing and potential future State mandated water use efficiency.

This report was prepared by engineering staff of the EDCWA, with support from Atkins North America, Inc. and Maddaus Water Management, Inc. The development of this report was coordinated with the primary West Slope water purveyors, El Dorado County Planning and agricultural interests. Thank you to the individuals listed in the acknowledgement section of this report whom provided various levels of peer review and/or input.

EDCWA envisions that this report will be updated in the future as additional new information becomes available, which may include any of the following:

- Urban Water Management Plans completed by July, 2016 by GDPUD and EID.
- Monitoring of conservation program progress in meeting SB X7-7 targets.
- Ability to further expand the recycled water system with seasonal storage beyond current plans.
- Additional annexations beyond what was assumed as “favorable areas” within this study.
- Changes in planned versus actual development patterns over time.
- Refined assessment of water supply reliability of existing supplies.

EDCWA and water purveyors’ web sites provide relevant reference planning documents cited in this report or made available through EDCWA along with new information over time. There is not a definitive timetable for any future update and the content of this report is based on current best available information.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Chapter 1. Background on the 2007 Water Resources Development Master Plan

The Water Agency, as the countywide water resources planning agency, has the responsibility to insure adequate water supplies for existing and future uses in accordance with the Act and the 2004 General Plan. The 2007 WRDMP was prepared to analyze the need for and to coordinate water-planning activities within the County to meet the County's water supply needs into the future.

The 2007 WRDMP was developed in consultation with the El Dorado Irrigation District (EID), Georgetown Divide Public Utility District (GDPUD), and Grizzly Flat Community Services District (GFCSD) and incorporated the land use and housing projections developed by the County for the 2004 General Plan.

Water supply information described in the 2007 WRDMP was based on historic watershed hydrologic conditions and included information for both the "firm yield" and "safe yield" approaches, based on the following definitions:

- **Firm yield** is the annual quantity of water that can be made available in most years while imposing water deficiencies during hydrologic drought conditions.
- **Safe yield** is the maximum amount of water that can be made available in any year, including the driest year(s) of record.

Typically, West Slope water purveyors utilize a firm yield approach to short term water supply management and have adopted requirements for customers to reduce their water consumption during short term drought periods. For long range water supply planning, it is common to also consider a safe yield, which bases the maximum annual yield on water rights and watershed hydrologic conditions, including a repeat of the driest year(s) of record.

Water demand projections for residential and commercial land uses in the County were developed by Economic & Planning Systems, Inc. (EPS) in 2003 for four land use alternatives for the West Slope of the County (excluding the Tahoe Basin) that were being considered for the adoption of a 2004 update of the County General Plan. EPS also developed water demand forecasts for the Tahoe Basin based on land use data provided by the Tahoe Regional Planning Agency. In 2006, ECO:LOGIC prepared an update of the water demand forecasts for the West Slope, based on the 2004 County General Plan and the methodology described in Chapter 4 and in Appendix E of the 2007 WRDMP.

The 2007 WRDMP addressed the water supply needs of the West Slope, including areas that are outside existing public water purveyor service boundaries, where water is supplied by individual property owner wells and small privately-owned water providers from wells and springs. In the 2007 WRDMP, areas not serviced by the three West Slope water purveyors were collectively referred to as "Other County Areas" (OCA). Over time, it was anticipated that water demand within some portion of the OCA would be provided with a public water supply via annexation into the Service Area of one of these three water purveyors, which has and continues to occur. Accordingly, future water demand within some portions of the OCA was reallocated (or reassigned) to EID and GDPUD. These areas are identified as "Favorable Areas." Potential commercial demands associated with the 2007 Floor Area Ratio (FAR) General Plan Amendment are also included. Detailed information on

Favorable Areas and the FAR General Plan Amendment is provided in Sections 3.2 and 2.4, respectively.

The growth rates utilized in the 2007 WRDMP are presented in **Table 1-1**. For reference, housing and employee forecasts and projected water demands from the 2004 General Plan (used in the 2007 WRDMP) are included in Appendix B. Actual growth rates are also included in Table 1-1 and were higher than projected in areas with a public water supply.

Table 1-1 Residential Growth Rates in the 2007 WRDMP

	OCA	***EID***	***GFCSD***	***GDPUD***	***West Slope***
Projected	2.44%	2.12%	1.69%	0.99%	2.12%
2000-2010 (actual)	not available	2.44%	2.63%	1.8%	2.09%
SOURCE: EDCWA (2007), Table 4-2. (See Table 2-7 of this report for actuals)					

As part of the 2004 General Plan Update, preliminary estimates of future agricultural water demand were developed by Wood Rogers in 2003, based on mapping of all “Important Farmland” on the western slope below 3,000 feet in elevation. This preliminary analysis raised some concerns because it included farmland within urbanized areas and parcels less than 10 acres (where the viability of commercial agricultural pursuits on such small acreage was questioned). To address those concerns, the 2004 General Plan included an alternative estimate of agricultural demand developed by EPS, based on information provided by the West Slope water purveyors. Because of the considerable differences between those two demand estimates, the 2007 WRDMP included the results of a mapping exercise conducted by ECO:LOGIC that refined the extent of agricultural lands included in the preliminary analysis conducted by Wood Rogers in 2003.

The 2007 WRDMP also provided a summary of past water efficiency efforts by the water purveyors. The summary graphics showing historical water savings are presented in Chapter 5 of this update to that report.

The 2007 WRDMP estimated the additional water supply need for the West Slope at buildout to be as much as 103,518 acre-feet/year (AFY) in a critically dry year (safe yield), as shown in **Table 1-2**, and recommended that several water supply projects be initiated to assure sufficient supplies would be available to meet projected demand, even during drought periods. That estimate did not include later State mandated urban water conservation requirements, which are considered in this update.

Table 1-2 EDCWA 2007 WRDMP Additional Supply Need at Build-Out

	Safe Yield Supply (acre-feet)	*Urban Demand (acre-feet)*	*Agricultural Demand[a] (acre-feet)*	*Total Demand (acre-feet)*	*Additional Supply Need (acre-feet)*

SOURCE: EDCWA (2007), Table ES-1

a. Values represent Year 2050 projection, not build-out

b. Further analysis of actual land use within the GFCSD boundary indicates a build-out demand of 504 acre-feet, which would result in 361 acre-feet of additional water supply need at build-out.

Note: Urban demands do not include State mandated urban water conservation considered in 2014 update.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Chapter 2. New Information Developed Since the 2007 WRDMP

2.1 WATER CONSERVATION LEGISLATION

Senate Bill X7-7 (SB X7-7), the Water Conservation Act of 2009, set an overall goal of reducing statewide per capita urban water use by 20% by December 31, 2020 (with an interim goal of at least 10% by December 31, 2015). To measure progress, the legislation requires that urban retail water suppliers (defined by California Water Code Section 10608.12(p) as “a water supplier, either publicly or privately owned, that directly provides potable municipal water to more than 3,000 end users or that supplies more than 3,000 acre-feet of potable water annually at retail for municipal purposes.”) determine their urban baseline” per capita water use (for residential, commercial and industrial uses) based on average demand for a recent 5 or 10 year period, expressed in gallons per capita per day (GPCD). In addition, a water reduction “target” demand (as expressed in GPCD) must be estimated using one of four specified methods:

1. 80% of baseline use
2. Sum of specified performance standards
3. 95% of DWR Hydrologic Region target from the draft 20X2020 Plan
4. A flexible alternative designed to adjust to local circumstances

In their respective 2010 Urban Water Management Plans (UWMP), EID declared it will implement Alternative 1 and GDPUD will implement Alternative 3 to comply with SB X7-7.

As part of their UWMP, urban water suppliers must include a potable water use reduction plan to demonstrate how they will achieve the per capita water demand target for their urban customers. Accordingly, future estimates of water demand should account for the reduction in per capita urban water use from the baseline established by the water purveyors. For the purposes of this analysis, both the per capita baseline and target are included for information purposes.

SB X7-7 also requires agricultural water suppliers (providing service to 10,000 or more irrigated acres) to implement certain efficient water management practices (including volumetric measurement and pricing), and must prepare, adopt and periodically revise agricultural water management plans. Notably, none of the West Slope water purveyors that serve agricultural water meet the identified threshold and are not subject to the related requirements.

Because per capita demand is required and monitored by urban water suppliers subject to SB X7-7, this new metric provides an opportunity to gauge water use via a single calculated value, rather than as the sum of various water use categories (e.g., residential, commercial and industrial). This update projects future water demand for the urban water suppliers on the West Slope of the County (EID and GDPUD) based on per capita water use (with adjustments for increased economic activity), including demand from the Favorable Areas of the OCA, which is reallocated to those two water purveyors. GFCSD, with less than 3,000 retail water connections, is not subject to the requirements of SB X7-7.

2.2 RECENT WATER SUPPLY AND DEMAND REPORTS

Since development of the 2007 WRDMP, several new water supply and demand reports have been developed by West Slope water purveyors, as summarized below. These include master plans and 2010 Urban Water Management Plans (UWMP), which are required for urban water suppliers in accordance with the Urban Water Management Act (codified in the California Water Code, Division 6, Part 2.6, and §10610 through §10656). The analysis of this report incorporates information from those reports or, where different methodologies are employed, augments that information as appropriate.

2.2.1 EID 2010 Urban Water Management Plan

EID's Service Area encompasses approximately 220 square miles on the western slope of the Sierra Nevada Mountains in El Dorado County. The Service Area is bounded by Sacramento County to the west, with a small area in Sacramento County just south of Highway 50 and the Pollock Pines/Sly Park area to the east, with elevation ranges from 500 feet to more than 4,000 feet. The City of Placerville, located in the central part of the District, receives water from the District as a wholesale customer. The District also operates two satellite water systems in the Strawberry and Outingdale communities. EID's Service Area is primarily located in two major watersheds, the South Fork American River in the north and the North Fork of the Cosumnes River in the south, and is hydrologically split by the Placerville Ridge and Highway 50.

For the 2010 UWMP, water consumption data was compiled from annual consumption reports for the following EID-defined user categories:

- Single family = single-family residential and single-family dual potable (recycled water for irrigation)
- Multifamily = multifamily residential
- Commercial/Industrial = commercial/industrial
- Landscape = recreational turf (dedicated irrigation)
- Agriculture = agricultural metered irrigation, domestic irrigation, and small farm irrigation (potable water)
- Other authorized uses (metered) = ditches, City of Placerville, potable billed and unbilled, and raw water billed
- Other authorized uses (not metered) = Main ditch and potable billed ditches (potable and raw water)

Total water use was calculated as the cumulative total of system deliveries (which is driven by water demand), sales to other water agencies (e.g., the City of Placerville), and system losses, as summarized in **Table 2-1**.

Table 2-1 EID 2010 UWMP Projected Water Use (acre-feet)

Total Projected Water Use (AFY)	*2010*	*2015*	*2020*	*2025*	*2030*
Total water deliveries	27,761	42,829	45,825	52,750	61,328
Sales to other water agencies	1,155	1,200	1,215	1,275	1,330
System losses	4,764	4,892	5,227	6,003	6,962
Total	***33,680***	***48,921***	***52,267***	***60,028***	***69,620***
SOURCE: UWMP EID (2011), Table 3-9.					

2.2.2 GDPUD 2010 Urban Water Management Plan

GDPUD is located on the western slope of the Sierra Nevada foothills, approximately 45 miles northeast of Sacramento, California. It straddles a ridge that separates the drainage basin of the Middle Fork American River and the Rubicon River (tributary to the American River) on the north from that of the South Fork American River on the south. The GDPUD existing Service Area encompasses approximately 75,000 acres (112 square miles) with approximately 30,000 acres currently having some form of water service available. GDPUD water supplies originate from the Pilot Creek Watershed above Stumpy Meadows Reservoir. Stumpy Meadows Reservoir is GDPUD's sole source of supply.

GDPUD presently provides domestic water service to the unincorporated communities of Georgetown, Buckeye, Garden Valley, Kelsey, Spanish Dry Diggins, Greenwood, Cool, and Pilot Hill. Through separate facilities, portions of these same communities also receive untreated water for irrigation purposes.

Elevations in GDPUD's Service Area vary from 500 feet at the southwestern boundary to 6,100 feet at Silver Hill on the eastern boundary. The relief varies from rolling foothills in the west to steep slopes and deep canyons in the upper elevations. The community of Georgetown is located at the top of the Georgetown Divide at an elevation of 2,650 feet.

Projected total water use within the GDPUD Service Area is summarized in **Table 2-2**.

Table 2-2 GDPUD 2010 UWMP Projected Water Use (acre-feet)

Total Projected Water Use (AFY)	*2010*	*2015*	*2020*	*2025*	*2030*
Single-family	1,380.2	1,684.4	1,696.8	1,836.0	1,987.6
Multifamily	16.6	23.3	23.4	25.4	27.5
Commercial	243.7	301.7	303.3	320.8	347.3
Industrial	—	—	—	—	—
Institutional/Governmental	15.1	17.1	15.7	—	—
Landscape	—	—	—	—	—
Agriculture (untreated)[a,b]	4,280.3	5,493.7	6,707.1	7,920.5	9,133.3
Other	43.4	94.5	97.5	130.9	141.7
Total (treated & untreated)	***5,979.4***	***7,614.7***	***8,843.8***	***10,233.6***	***11,637.4***

Table 2-2 GDPUD 2010 UWMP Projected Water Use (acre-feet)

Total Projected Water Use (AFY)	*2010*	*2015*	*2020*	*2025*	*2030*

SOURCE: UWMP GDPUD (2011), Tables 10, 11, 12, and 13.

a. Agricultural (untreated) water is metered using a subsurface orifice and sold by the miner's inch.

b. Agricultural (untreated) water demand does not include carriage and ditch losses. Losses are included for the treated water. Latent demand is included in the future projected demands.

2.2.3 GFCSD Water Supply and Demand Update (2012)

Grizzly Flats Community Service District's Service Area covers approximately 1,115 acres and includes the Grizzly Park subdivisions and several larger perimeter parcels. In 2012, there were 607 metered connections in the system, down slightly from 611 connections reported in 2009. The District estimates that approximately 1,252 parcels could require water within the Service Area at future build-out of the community.

From the 2012 GFCSD Water Supply and Demand Update (WSDU), the current safe yield evaluation of the water supply indicates that approximately 165 acre-feet of water would be available for the critical dry year based on the hydrological record. Using a demand factor of 0.25 acre-feet per DU per year from the 2012 WSDU, approximately 660 meters could be served with currently available water supplies. At projected build-out, approximately 313 acre-feet of water would be required to service a total of 1,252 dwellings. To meet the safe yield criteria for the system, if additional wells are not developed, an off-stream reservoir with a minimum active storage capacity of 150 acre-feet was recommended.

The GFCSD Service Area is at approximately 50% of buildout in terms of existing parcels but is more than 90% of builtout in terms of currently available supply.

2.2.4 EID Integrated Water Resources Master Plan (2013)

EID developed the 2013 Integrated Water Resources Master Plan (2013 IWRMP) to provide a plan that optimizes the use of EID's water resources and provides a roadmap for cost effective development of future infrastructure and maintenance of existing facilities. This goal, combined with current economic conditions, limited water supply, environmental constraints, and climate change, necessitates the need for a unified project vision, which was articulated as follows (EID 2013, p. 5):

> Similar to many water agencies in California, the El Dorado Irrigation District (District) desires to maintain its current level of service while preparing for future growth in an environmentally and fiscally responsible manner, while also considering the impacts of aging infrastructure systems and the uncertainties of climate change. The District sees the Integrated Water Resources Master Plan and Wastewater Facilities Master Plan Project as being the mechanism to address future water supply, infrastructure, and replacement needs in an integrated fashion.

For the 2013 IWRMP, EID developed water use factors for land uses included in the 2004 General Plan, based on historical water demand within the District's service zones (EID 2013, p. 87). Single-family residential land uses, including high-, medium-, and low-density, and rural residential, were assigned density factors, which represent the average density for each land use category, respectively, as described in the 2004 General Plan.

Water use factors were based on EID's design standard household unit use and reflect the different demands for each of the three supply regions (eastern, western, and El Dorado Hills). EID design standards are based on historic averages with imbedded water conservation. Historic water use efficiency is discussed in detail in Chapter 5. In the higher elevation eastern region, dwelling unit water use is the lowest, while in the lower elevation El Dorado Hills region, per capita water use is the highest. This difference is primarily attributed to a longer growing season and higher evapotranspiration rates at lower elevations and more extensive landscaping for commercial land uses in the more urbanized El Dorado Hills region. This variation in demand is illustrated by the different residential water use factors for each service region, which are summarized in **Table 2-3**. For other land use types (e.g., commercial, industrial, and multifamily residential), data from EID's 2006 Consumption Report was used in combination with existing parcel data to generate use factors for each service zone.

Table 2-3 Residential Unit Demand Factors by EID Service Region

Land Use Type	***Unit Demand per Dwelling Unit (AFA)***		
	Eastern	***Western***	***El Dorado Hills***
High Density Residential	0.4	0.67	0.72
Medium Density Residential	0.45	0.95	1.53
Low Density Residential	0.99	1.35	1.07
Rural Residential	0.99	1.03	1.03
SOURCE: EID (2013), Table 4-1.			

Note: Unit demand factors do not include State mandated water conservation

The 2013 IWRMP provided growth rate estimates for each of the three different service regions, as presented in **Table 2-4**.

Table 2-4 EID Projected Growth Rates by Region

Period	***EID Service Region***		
	Eastern	***Western***[a]	***El Dorado Hills***[b]
2009–2015	0.15%	0.82%	1.19%
2016–2020	0.30%	1.65%	2.38%
Beyond 2020	0.61%	3.29%	4.75%
SOURCE: EID (2013), Table 9-2. a. Includes EID water service zones 1, 4, 5, 6, and 7. b. Includes EID water service zone 2.			

The 2013 IWRMP also provided a low- and high-growth scenario. The high-growth scenario starts with a baseline year of 2008 and reflects pre-recession demand levels. The low-growth scenario is described (EID 2013, p. 243) as follows:

> The low growth scenario was developed in consultation with District staff and considers the recent economic downturn and the impact on development in the District's service area. This lower growth scenario starts with the 2012 maximum day demand and was developed with the expectation that growth throughout the service area will be slow for two to three more years while the economy continues to recover. Then growth will ramp up in the El Dorado Hills Region as already planned and approved developments build out. Following that, the growth rate in the El Dorado Hills Region will decrease as the remaining land may be more difficult to develop (e.g., further away from the urban area and existing infrastructure). Growth in the Western Region is expected to increase in the coming years as new developments are planned, approved and constructed south of the Highway 50 corridor initially and then throughout the Western Region. Growth in the Eastern Region is expected to remain low throughout the planning period.

Projected future water demand for the entire EID Service Area is presented in **Table 2-5** for both the low-growth and high-growth scenarios. These are current projections, which may be revisited in the future as significant growth occurs.

Table 2-5 Projected Water Demand within EID Service Area

Year	*Total Water Demand (AFY)*	
	Low Growth Scenario	*High Growth Scenario*
2015	43,398	48,863
2020	45,639	52,092
2025	50,345	59,465
2030	55,136	68,375
2035	61,262	77,315
Build-Out	88,144	88,144
SOURCE: EID (2013), Table 9-1		

Note: The baseline year for the high-growth scenario is 2008 (pre-recession) and for 2012 (post- recession) for the low-growth scenario. Build-out demand is the same for both scenarios.

2.3 RECENT WATER PURVEYOR TRENDS

All the purveyors in the County experienced similar water use trends influenced by economic conditions and dry year connections.

2.3.1 El Dorado Irrigation District

As demonstrated in **Figure 2-1**, EID's service area population and number of accounts have risen

steadily over the last two decades, with a slight reduction in the population growth rate in more recent years during the severe economic recession from 2008-2011. The early 2000's drought does not seem to have affected water supply delivered; however, the dry year water conditions from 2007-2009 and 2011-2012 economic recession did combine to markedly reduce water supplied. Chart values and trends are not weather normalized. It is important to note the reduction in water production also can be attributed to conservation activities by EID.

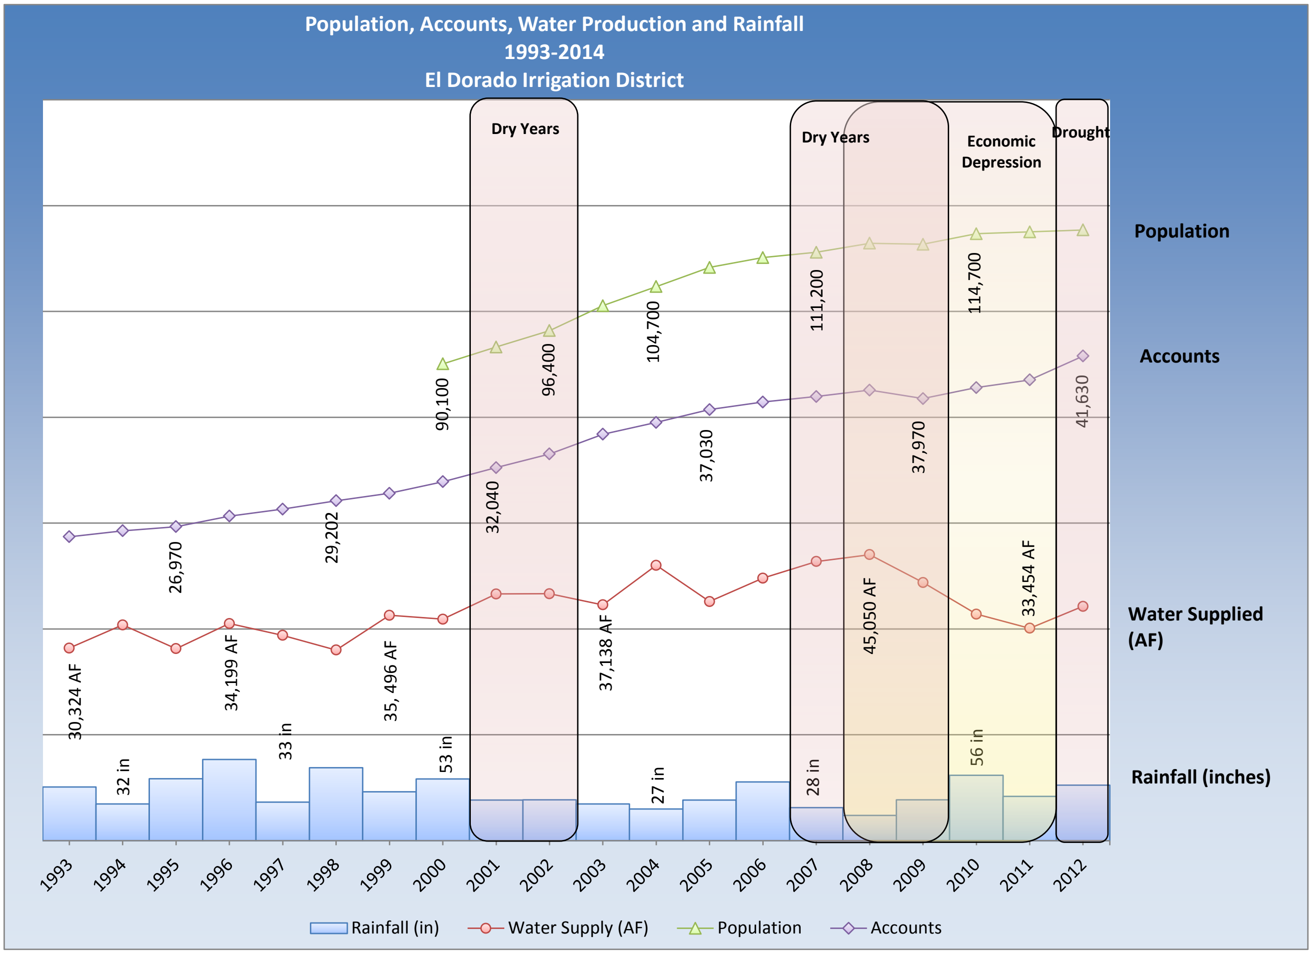

Figure 2-1 El Dorado Irrigation District Historical Water Use Trends

Source: EID (1999,2008, 2013) Comprehensive Annual Financial Report
EID (1993-2012) Diversion Reports
a. Water supplied/diverted includes agricultural demand connected to the potable water system

2.3.2 Georgetown Divide Public Utility District

As shown in **Figure 2-2**, GDPUD's service area population and number of accounts have risen steadily over the last two decades, with a slight reduction in the population growth rate in more recent years during the economic recession from 2008-2011 similar to EID's service area. The early 2000's drought does not seem to have affected water production. However, the dry year water conditions from 2007-2009 and the recent economic recession did combine to markedly reduce water production. Chart values and trends are not normalized for weather. It is important to note the reduction in water production also can be attributed to conservation activities in the GDPUD service area.

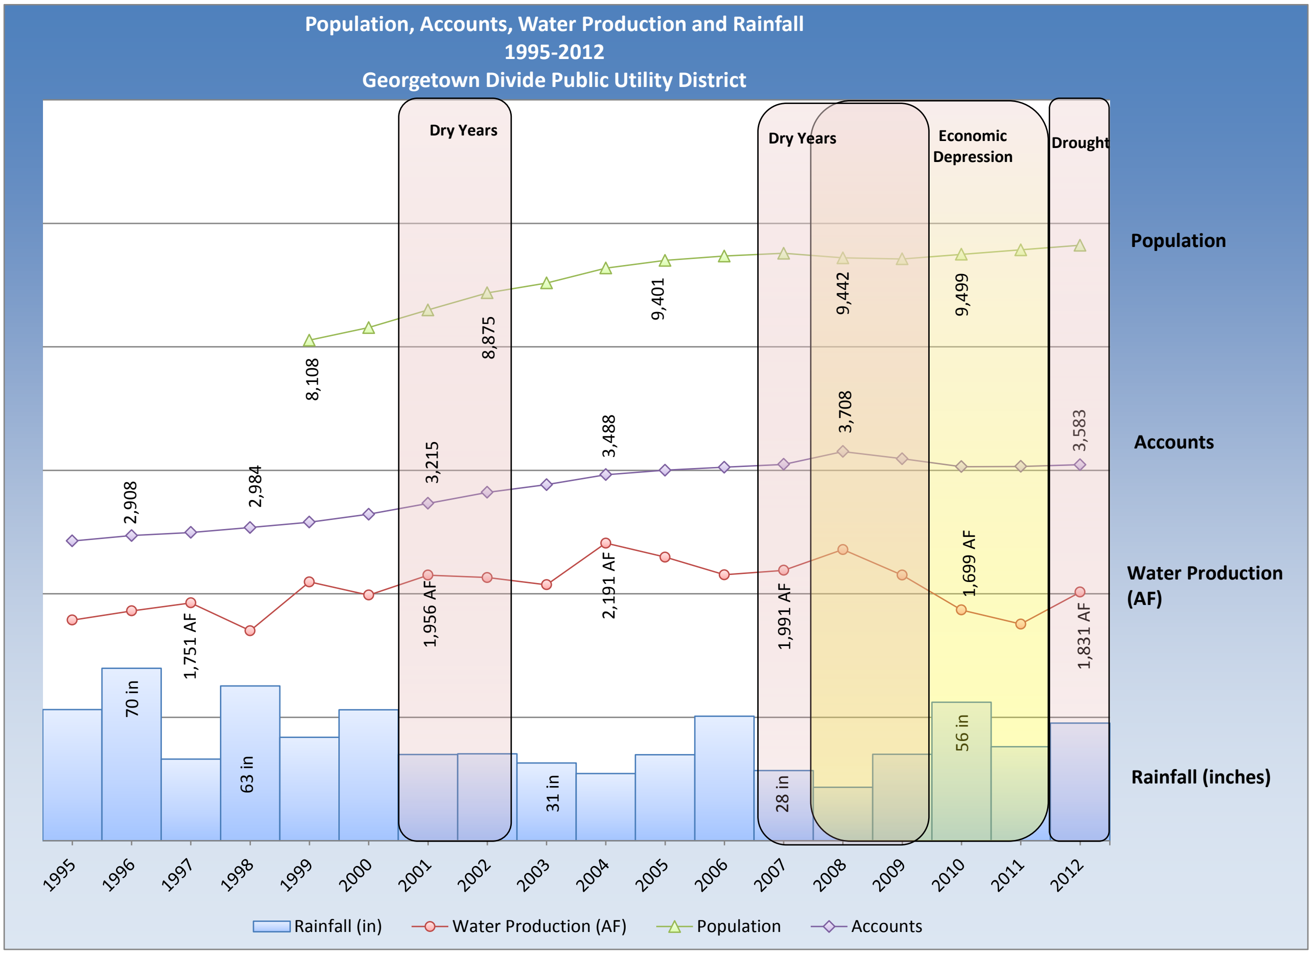

Figure 2-2 Georgetown Divide Public Utility District Historical Water Use Trends
SOURCE: GDPUD Water Supply and Demand Summaries

2.4 CHANGES IN LAND USE

The 2007 WRDMP based urban water demand estimates upon allowable land uses in the West Slope in accordance with the 2004 General Plan. Water demand estimates for the 2007 WRDMP/2004 General Plan were based on the projected number of 2004 General Plan residential dwelling units and employee projections (which were derived from the projected increase in residential population, using the region's current jobs/housing ratio). Additional potential water demand associated with the FAR General Plan Amendment was also included. Changes in land use that increase the number of dwelling units and/or the number of employees would increase water demand.

2.4.1 Economic Activity

According to the 2004 General Plan and 2007 FAR General Plan Amendment, more economic growth as a percentage of residential growth is possible under buildout conditions. In **Table 2-6**, 2004 General Plan West Slope housing and employment projections are provided for 1999, 2010 (estimated) and buildout. **Figure 2-3** presents the data in terms of percentage of households and jobs.

Table 2-6 West Slope General Plan Housing and Employee/Jobs Projections (acre-feet)		
	Households	***Employees/Jobs***
2004 General Plan Baseline Condition (1999)	42,579	30,434
2010	64,209	37,027
Buildout - 2004 General Plan	117,262	117,122
SOURCE: EDC (2004) Appendix E bae (2013) Page 4 SACOG (2012)		

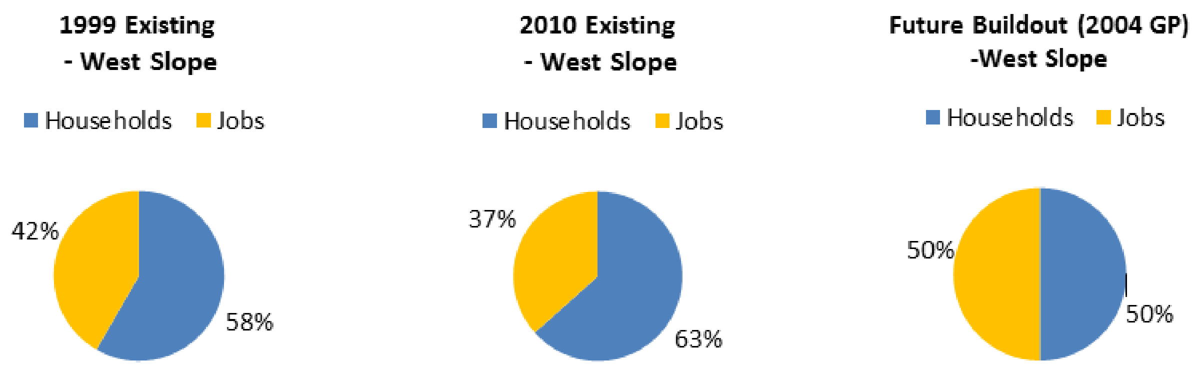

Figure 2-3 West Slope Baseline, 2010, and Buildout Households versus Jobs

In 2007, the County adopted an increase in the allowable floor-area ratio (FAR) for commercial and industrial uses from 0.25 to 0.85, and for research and development (R&D) uses from 0.25 to 0.50. FAR expresses the maximum allowable square footage of development as a percentage of lot size and thereby regulates the size (in square feet) of such development within the unincorporated portions of the County. The adopted increase in the FAR allows an increase in the size of commercial, industrial and R&D buildings than was previously allowed under the 2004 General Plan. With the potential for larger commercial, industrial and R&D buildings, future commercial development (or redevelopment) could result in more employees in the County, which would result in additional water demand.

The December, 2006 Final Environmental Impact Report (State Clearinghouse #2006052029) for the General Plan FAR Amendment (#A06-0002) estimated that an additional 13,869 acre-feet of water demand would result from the amendment under buildout conditions, within the EID and GDPUD Service Areas. Accordingly, water demands need to be adjusted to account for the subsequent increase in the FAR. **Table 2-7** is from the FAR Amendment Draft Supplemental Environmental Impact Report. **Figure 2-4** presents the data in terms of percentage of households and jobs.

The FAR General Plan Amendment more than doubles the jobs projection for the County from approximately one job to two jobs per household. This ratio is higher than surrounding communities and may not be fully achieved in the County. The unit water demand of 0.108 acre-feet per job/employee in Table 2-7 for the FAR General Plan Amendment is derived from the total water demand divided by the number of jobs from the 2004 General Plan. The total demand from the 2004 General Plan was calculated with differential unit demand factors as high as 0.22 acre-feet in the western down slope areas of EID and as low as 0.07 in the eastern upslope areas of EID. For the GDPUD Service Area, 0.18 acre-feet per job/employee was used. It is likely a majority of the higher density commercial development contemplated under the FAR General Plan Amendment will occur in the western portion of the County where unit demand is much higher than 0.108 acre-feet per employee used to calculate demand for the FAR General Plan Amendment. Although the number of jobs contemplated under the FAR General Plan might be ambitious, because low unit water demand factors were used in calculating total demand, the full amount of potential water demand identified is included in this update.

Table 2-7 West Slope Floor Area Ratio General Plan Amendment Potential Employees and Water Demand (acre-feet)

	2004 General Plan	*Water to Employee Ratio*	*General Plan FAR Amendment*
Total Employees	117,122	0.108 acre-ft/yr/employee	245,543
Total Employee Water Demand	12,649		26,518

SOURCE: EDC (2006b) Table 5.4-5

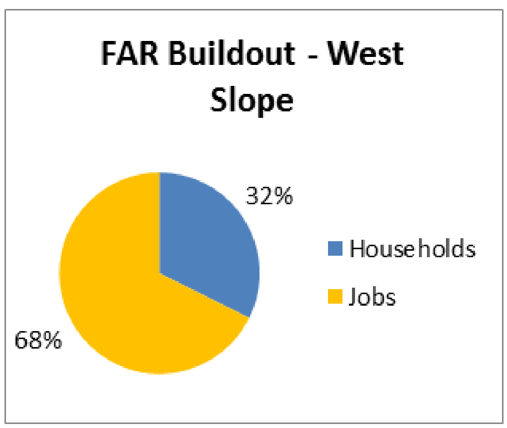

Figure 2-4 West Slope Buildout w/ FAR General Plan Amendment Households versus Jobs

The El Dorado County Planning Commission in approving the FAR General Plan Amendment Supplemental Environmental Impact Report cited the following benefits of the amendment:

- Local retention of sales tax revenue;
- FAR levels more in keeping with surrounding jurisdictions will allow the County to compete for regional employment centers;

- Increased revenue from increased property values;
- Promotes infill/compact development together with mixed use that include more transit choices; and
- Supports a jobs/housing balance and diversifies the County economic base.

2.4.2 Targeted General Plan Amendment

The County is currently working on a Targeted General Plan Update (or Targeted Update), which is proposed to include minor revisions to the land use map and General Plan policies, which are proposed to meet the following goals and objectives (El Dorado County 2013c):

a. Increases employment opportunities within El Dorado County;

b. Promotes the development of housing affordable to moderate income households;

c. Provides additional opportunities to retain retail sales and sales tax revenues within El Dorado County;

d. Protects and enhances the agricultural and natural resource industries; and

e. Is necessary to comply with changes in State or federal law.

On November 14, 2011, the County Board of Supervisors adopted a Resolution of Intention (ROI 182-2011) for a Targeted General Plan Amendment that identifies potential revisions to the General Plan, including:

- Amending Policy 2.1.1.3 to consider increasing the allowable residential density and increasing residential use as part of a mixed-use development from 16 units per acre to 20 units per acre to achieve CEQA streamlining benefits.
- Consider amending General Plan Table 2-1 and Policy 2.2.1.2 for Commercial and Industrial to allow for commercial and industrial uses in the Rural Regions.
- Consider increasing density for multifamily housing from 24 to 30 units per acre (to comply with California Government Code section 65583.2(c)(iv) and (e).

Although the Targeted Update is still a proposal, the increase in residential density for mixed use developments and multifamily housing could increase water demand associated with those uses. However, for purposes of this analysis, no increase in water demand is included for those proposed elements of the Targeted Update.

The Targeted Update is also proposed to include 21 separate amendments which have been identified (El Dorado County 2012) as promoting agricultural uses in the County, including the expansion of Agriculture District boundaries for Garden Valley-Georgetown, Coloma, Camino-Fruitridge, Gold Hill, Oak Hill, Pleasant Valley, and Fair Play-Somerset, as shown on **Figure 2-5** (Potential Expansion of El Dorado County Agricultural Districts).

Agri-tourism has continued to grow in the County over the past three decades. For example:

Apple Hill, a successful apple growers' organization located in El Dorado County, was formed over 36 years ago. It was motivated by the search for a sustainable economic use of the land, but its proximate stimulus was a visit to Oak Glen in Southern California by one of the growers, Gene Bolster. The concept of combining tourism and direct marketing was introduced. Bethell, Bolster and Ed Delfino (former El Dorado County Agricultural Commissioner) worked assiduously to promote the new marketing concept and to develop the organization…. The Apple Hill Growers Association has grown from the original 16 ranches to about 45 currently [2012], if we include Christmas tree growers and vineyards. (Source: Department of Agricultural Economics, University of California, Davis; University of California Cooperative Extension Yolo County, 2012)

Figure 2-5 Potential Expansion of El Dorado County Agricultural Districts

The importance of Agricultural Districts to the County is explained in Policy 8.1.1.1 of the 2004 General Plan:

> Agricultural Districts are intended to be created and maintained for the purposes of conserving, protecting, and encouraging the agricultural use of important agricultural lands and associated activities throughout the County; maintaining viable agricultural-based communities; and encouraging the expansion of agricultural activities and production.

In addition to many existing policies that are protective of agricultural uses, the proposal to expand Agricultural Districts underscores the County's intent to support and enhance agricultural uses, which could contribute to increased water demand from agricultural land uses. Section 3.4 provides a detailed discussion of agriculture in the County.

2.4.3 General Plan Amendments

Updates to this 2014 Report will reflect all future approved land use developments. .

2.5 MODIFICATION OF SERVICE AREA BOUNDARIES

The 2007 WRDMP purveyor water demand projections were based on purveyor Service Area boundaries that existed in 1999, which was the baseline year for the 2004 General Plan. Since 1999, the El Dorado County Local Agency Formation Commission (LAFCO) has approved 40 annexations to water purveyor's Service Areas to provide water service to an area of approximately 5,000 acres with approximately 2,900 equivalent dwelling units (EDU) (based on currently allowed land uses). A majority of these annexations have occurred in the El Dorado Hills area within the EID Service Area. Assuming the current EDU demand in El Dorado Hills of 0.77 acre-feet per EDU (EID 2013b), these annexations could generate as much as 2,200 acre-feet of demand. These annexations occurred in the Favorable Areas of the OCA. All but one of the annexations has been into the EID Service Area. A list of completed annexations with associated acreage, equivalent dwelling units and proposed land uses is provided in Appendix A to this Report.

2.6 HISTORIC GROWTH AND RECENT GROWTH PROJECTIONS

To identify an appropriate growth rate to estimate future water demand, recent growth rate projections from several sources have been reviewed and are summarized in Table 2-9. These forecasts illustrate the variability in available growth rate projections, the different time periods used for the various forecasts, and the different areas covered (Countywide, purveyor Service Area, and West Slope only). In addition, the growth rates in **Table 2-8** reflect a general decline from projections made in the previous decade (not included in the table), which reflect the national economic downturn that began in 2008. Historic 2000-2010 growth rates for areas with public water supplies (e.g. EID, GDPUD, and GFCSD) are greater than the County as a whole. Growth rates have been even higher for areas with close access to Highway 50 such as the EID Service Area. This trend is expected to continue and is reflected in the future growth rates used by the water purveyors in their planning documents.

Table 2-8 Comparison of Recent Growth Projections for El Dorado County or West Slope

Year	Title	2000–2010[a]	2015	2020	2025	2030	2035
2011	EID 2010 Urban Water Management Plan[b,d]	2.44%	0.40%	1.71%	1.57%	1.55%	
2011	GDPUD 2010 Urban Water Management Plan[b]	1.8%		1.97%		1.65%	
2012	GFCSD Water Supply and Demand Update[b,c]	2.63%	2.7%	2.68%	2.25%	2.03%	1.48%
2013	State of California Department of Finance (County-wide)						1.28%
2013	EID Integrated Water Resources Master Plan[b]	2.44%[d]	0.63%	1.29%	2.68%	2.83%	2.49
2013	2013 El Dorado County Housing Element Update (County-wide)	1.34%		1.16%	1.65%		
2013	El Dorado County Targeted Update (West Slope)	2.09%[e]					1.03%

EID (2013), forecasted growth for the entire EID service region derived from Table 9 in Appendix C;
El Dorado County (2013), Table HO-2;
GDPUD (2011), derived from Table 5;
GFCSD (2012), Table 2 and Figure 2;
CDOF (2013).

a. Estimates of historical growth included for comparative purposes where available.
b. Growth within the purveyor's Service Area.
c. Growth projection data from 1998 Borcalli and Associates report, not updated in 2012 report.
d. Based on EID data worksheets used for GPCD development (supplemented with data for 2006 to 2010) and Tracey Eden-Bishop personal communication with S. Fraser (February 27, 2012).
e. West slope growth estimate from BAE worksheets, per Tracey Eden-Bishop, personal communication with N. Porter with El Dorado County (November 25, 2013).

For the 2013 Targeted Update, growth projections to 2035 were developed by bae urban economics, which considered three potential growth rates from 2010 to 2035: *(a)* 1.28%, based on a projection from the California Department of Finance (DOF), *(b)* 0.72%, based on a projection of growth in households from the Sacramento Area Council of Governments (SACOG) (not included in Table 2-8); and *(c)* 1.03%, based on an analysis of the historic growth rate of West Slope households prepared for the County's 5-year update as required by the General Plan. The rate of 1.03% is proposed to be used for the Targeted Update, which will only include land use changes for the West Slope area. In recommending this rate, it was noted:

> As this estimate falls in the middle of the range between the DOF and SACOG residential growth rates, this growth trend has been deemed a reasonable basis to project residential growth through 2035. [bae urban economics 2013, p. 5]

Although the growth rates used in County-wide planning documents and those used in water planning reports vary considerably, the differences are consistent with historical trends. For example, in the GDPUD Service Area, average annual growth was approximately 3.1% from 1990 to 2000 (GDPUD 2011, p. 11) and 1.8% from 2000 to 2010 (per the 2010 UWMP), while a growth rate of 2.5% was reported for the EID Service Area between 1988 and 1999 (EID 2006, p. 3-2) and 2.44% from 2000 to 2010 (refer to Table 2-8). This trend (of differential growth rates) is expected to continue, as growth will likely continue to be concentrated in more urbanized areas of the County due to the availability of commercial and utility services and ongoing improvements to the street and highway network. As noted in the EID 2013 IWRMP:

> [It] is expected that the average growth rate within the District's service area will be higher [than the Countywide rate in the 2008 Housing Element Update], particularly in the El Dorado Hills and Cameron Park areas, due to their proximity to Sacramento, as well as the population density and availability of water when compared to other, more remote areas in the County. [EID 2013, p. 93]

A more detailed discussion of the growth rates used for each purveyor and its Service Area is provided in Section 3.1.2.

2.7 CLIMATE CHANGE

In the past decade, the subject of climate change continues to be a source of much discussion for the water community in California, due to the potential implications for changes in hydrologic conditions, considerable uncertainty about how to identify specific impacts to the West Slope of the County or the Mountain Counties region, and the feasibility of strategies to mitigate any such effects. Despite the inherent uncertainty in projecting water supply conditions several decades in advance, it has become increasingly clear that water resource planning can no longer solely rely on calculated estimates of average or "normal" weather conditions from the past century.

Given the long range nature of this analysis, it is prudent to consider options that assure the water resource management systems that serve the West Slope are more resilient to extreme weather conditions and can provide sufficient water to serve the land uses identified in the adopted General Plan. As many long range climate predictions suggest an increased potential for more extreme weather events in this century, this analysis addresses the potential that more extreme or prolonged drought conditions will occur during the time period until buildout conditions would be realized on the West Slope.

In 2008, with respect to the generalized impacts of climate change on water demand, the California Natural Resources Agency (CNRA) and the California Department of Water Resources (DWR) concluded:

> *Warmer temperatures will likely increase evapotranspiration rates and extend growing seasons, thereby increasing the amount of water that is needed for the irrigation of many crops, urban landscaping and environmental water needs. Reduced soil moisture and surface flows will disproportionately affect the environment and other water users that rely only on annual rainfall such as non-irrigated agriculture, livestock grazing on non-irrigated rangeland and recreation. [CNRA and DWR 2008, p. 5]*

In 2013, with respect to the potential impacts of climate change on the hydrologic cycle in the Mountain Counties, the Draft 2013 Update of the California Water Plan suggests:

> *Projected warmer temperatures are likely to contribute to changes in the hydrologic cycle. Potential changes include reduced snow accumulation, higher snow elevations,*

> *change in runoff timing, more frequent rain-on-snow events, more frequent and higher peak flows, and lower summer stream flows and groundwater levels. [DWR 2013, p. MC-2]*

To address the potential effects of climate change, in the Mountain Counties Regional Report (and elsewhere in the 2013 draft update of the California Water Plan), DWR suggests that Integrated Regional Water Management (IRWM) planning:

> *…is a framework that allows water managers to address climate change on a smaller, more regional scale… IRWM regions must identify and prioritize their specific vulnerabilities, and identify adaptation strategies that are most appropriate for sub-regions. Planning strategies to address vulnerabilities and adaptation to climate change should be both proactive and flexible, starting with proven strategies that address the region today, and adding new strategies that will be resilient to the uncertainty of climate change. [DWR 2013, p. MC-36]*

Development of the Cosumnes, American, Bear and Yuba (CABY) Integrated Regional Water Management Plan (IRWMP) has provided, and likely will continue to provide, many benefits to the West Slope from the identification and implementation of strategies and multipurpose projects that can make the region more resilient to climate extremes. However, the CABY region shares many similar attributes, including geologic conditions that provide only limited opportunities for groundwater storage. As a result, the West Slope and the Mountain Counties have little opportunity to improve water supply reliability via conjunctive use programs directly within their regions, although several IRWM regions in the Sacramento River Valley have significant groundwater storage opportunities. To expand the benefits of IRWM planning, it may be necessary to seek inter-regional solutions that reach outside of the existing IRWM planning boundaries to enhance supply reliability. Further, although it is clear that the CABY IRWMP provides many useful examples of multi-benefit approaches to water supply enhancements, EDCWA has the continuing obligation to conduct long range water supply planning for the County as envisioned by its legislative Act.

As noted above, many predictions are possible that suggest shifts in hydrologic conditions during the planning horizon for this analysis. The combination of rising temperatures, a smaller snowpack, and more frequent and potentially longer droughts could reduce the availability of both surface and groundwater supplies, as more water runs off or evaporates and less infiltrates into the ground. Reduced infiltration could reduce the reliability of groundwater wells drilled in fractured rock, which are common on the West Slope.

Current systems will likely be impacted by the loss of natural snowpack storage and the resultant changes in runoff timing. The need to preserve flood storage space in multipurpose reservoirs could limit the availability of storage for water supply purposes, as variable weather patterns could make reservoir management more difficult, and in some years, such as in 2014 with challenges by USBR to provide full contract deliveries to EID, the result is and will continue to be insufficient storage to meet projected demands in dry years. If groundwater wells become less reliable, requests for annexations into the Service Areas could increase, which would make the West Slope even more dependent on surface storage.

These conditions suggest the potential for adverse impacts to water supply reliability on the West Slope over the long term. The potential combination of (1) increased water demand, (2) changes in runoff patterns, (3) reduced availability of both surface and groundwater supplies, and (4) increased frequency of drought conditions, could require major adjustments in the conservation and management of water supplies in what could become a more extreme mix of wetter and drier water years.

The concept that future weather conditions could be more extreme must be tempered with the knowledge that even over the past century "normal" years are rare: variability in weather has always been the norm. Although planning for an average year will always be part of the task, more serious extremes must also be addressed to identify available options.

As suggested in the Mountain Counties Regional Report:

> Enough data exists currently to warrant the importance of contingency plans, mitigation (reduction) of [Greenhouse Gas] emissions, and incorporating adaptation strategies, methodologies and infrastructure improvements that benefit the region at present and into the future... Resilience to an uncertain future can be achieved by implementing adaptation measures sooner rather than later. [DWR 2013, p. MC-33]

A discussion of more specific impacts of Climate Change on water supplies is provided in Section 6.1.2, including an assumed reduction in surface water supplies and increased demands due to prolonged drought conditions.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Chapter 3. Assumptions for Water Demand Projections

The foundation of EDCWA planning for sufficient water supplies to serve future growth in the County is based on adequate supplies and infrastructure. The basis for determining the amount of needed supplies relies on a detailed forecast of future water demand. This chapter describes the water demand projections based on four main elements:

- housing and jobs/employment forecasts for the Western Slope developed by the County of El Dorado for its 2004 General Plan and disaggregated by purveyor service area;
- reallocation of projected housing growth from portions of the OCA to adjacent water purveyors;
- application of per capita water use factors (EID and GDPUD) with adjustments for increased commercial activity and household water demand factors; and
- estimates of agricultural land use and crop water use.

Chapter 4 presents the water demand projections based on the assumptions outlined in this chapter.

3.1 HOUSING AND EMPLOYMENT FORECASTS

Urban water demand is typically based on estimates of current and projected future residential households and employment. Based on census data, the average number of persons in a household can be identified and used to convert housing units into a corresponding population estimate. These numbers are used here to project future water demand.

As discussed above, SB X7-7 set an overall goal of reducing statewide per capita urban water use by 20% by December 31, 2020. To measure progress, the legislation requires that urban retail water suppliers determine their baseline per capita water use otherwise referred to as gallons per capita day (GPCD), develop water use reduction targets (which reflect conservation), and articulate a plan to meet those targets. EID and GDPUD are both subject to the requirements of SB X7-7, and their respective UWMPs identify baseline per capita water use and the associated reduction targets. Target GPCD is used to forecast water demand for Year 2020, and Target GPCD with adjustments for increased economic activity projected in the 2004 General Plan is used to project buildout demand. Adjustments are based on the ratio of urban water demand per household projected in the 2007 WRDMP/2004 General Plan (Appendix B) for the baseline year of the 2004 General Plan and Buildout. This approach captures urban water conservation required by the State by starting with Target GPCD while also accounting for changes in land use over time by adjusting for increased economic activity.

For the GFCSD water Service Area and the portions of OCA that are not considered Favorable Areas (and are unlikely to receive water from an urban water supplier in the future), residential water and commercial demand is based on a housing and employee/jobs unit demand factor, which does not include any reductions in water demand (as those areas are not subject to the requirements of SB X7-7).

The County has estimated both current and future households and jobs in the 2004 General Plan (and those projections were incorporated into the 2007 WRDMP and are included in Appendix B). As the forecast was used for the 2007 WRDMP, and as that forecast is not proposed to be substantially altered by the Targeted General Plan Amendment, the housing and jobs forecast from the 2004 General Plan is the basis for this analysis. Potential demands resulting from the FAR General Plan Amendment are also included as a separate component of the total water demand.

3.1.1 Identification of Potential Growth Rates for this Analysis

To estimate potential future water demand, typically a growth rate is applied to baseline conditions. Growth rate projections are available from several sources, including:

- Rates used in recent County planning documents
- Rates developed by the State of California Department of Finance
- Rates used in planning reports prepared by the major water purveyors

Alternatively, new growth rates can be developed for the purposes of this analysis.

El Dorado County Planning Documents

The 2013 Housing Element, which applies to the entire County, incorporated a variable growth rate, of 1.15% until 2020 and 1.68% for the period of 2020 to 2025. A growth rate of 1.03% for the West Slope is proposed to be used for the Targeted Update (EDC 2014), based on the historic trend of growth in the County.[1]

With respect to the proposed growth rate for the Targeted Update, bae urban economics noted:

> *… a number of issues… constrained the development pattern within the County during the first half of the 2000-2011 time period for which the historic trend data was analyzed. This included legal restrictions on development due to environmental issues relating to rare plant species. In addition, the alignment for the Diamond Springs Parkway was not resolved until 2011. [bae urban economics 2013, p. 7]*

In order to test for the possible effect of changes in the development pattern due to the lifting of these constraints, County staff provided bae urban economics with data on development application activity from 2006 through the early 2013, which indicated that:

> *… the trend [in development applications] since [2006] has shown even greater interest in developing within Market Areas 1 [El Dorado Hills] and 2 [Cameron Park/Shingle Springs] than indicated by the longer term historic trend. [bae urban economics 2013, p. 7]*

The population analysis included in the County General Plan 2013 Housing Element (adopted October 13, 2013) indicates that the countywide growth rate was 3.91% from 1990-2000, and 1.34% between 2000 and 2010 (refer to Table 2-8). In the GDPUD Service Area, the average annual growth was approximately 3.1% from 1990 to 2000 and 1.8% from 2000 to 2010 (GDPUD 2011, p. 11). Growth of 2.5% has been reported for the EID Service Area between 1988 and 1999 (EID 2006, p. 3-2) and 2.44% from 2000 to 2010 (refer to Table 2-8).

Given historical growth patterns, it is uncertain whether growth in the County will be limited to 1.03% annually until 2030. As portions of the County experience different rates of growth, with this growth

[1] Tracey Eden-Bishop, personal communication with N. Porter (November 25, 2013).

concentrated in those areas served by a major water purveyor particularly in the western portion of the County, the use of a single growth rate for the entire West Slope is not appropriate for this analysis, as this methodology would not capture the variability in water demand from different West Slope areas.

Differential growth rates can be derived by pro-rating future growth based on differences in historical growth patterns. For example, for the period of 2000 to 2010, an estimate of 2.09% for West Slope growth can be derived from census data (refer to Table 2-8), historically the EID and GDPUD growth rates of 2.44% and 1.8%, respectively were 17% higher and 14% lower than the West Slope rate. Thus, future growth rates for those service providers could be estimated by adjusting a West Slope growth rate proportionally, as presented in **Table 3-1**.

Table 3-1 Potential Residential Growth Rates Based on Proposed Targeted General Plan Update (West Slope)

	Through 2035
Projected West Slope Growth	1.03%
Pro-rated growth within EID Service Area[a]	1.21%
Pro-rated growth within GDPUD Service Area[b]	0.89%

SOURCE: EDC (2014) Targeted General Plan Amendment
a. Assuming growth within the EID Service Area is 17% higher than the west slope rate.
b. Assuming growth within the GDPUD Service Area is 14% lower than the West Slope rate.

State of California Department of Finance Projections

The State of California Department of Finance (DOF) periodically generates population forecasts that incorporate future growth rates. A recent forecast for El Dorado County was 1.28 % annual growth (refer to Table 2-8). Although this rate was considered for use in the County's Targeted Update, a lower rate of 1.03% was adopted by the County.

As noted above, a single growth rate will not capture historical variability in growth, which can be generated by pro-rating future growth based on historical differences in growth. Per Table 2-8, between 2000 and 2010 County-wide growth was 1.34%, while EID growth was 2.44% (approximately 82% higher) and GDPUD growth was 1.8% (approximately 34% higher). Therefore, based on this methodology, future growth rates for those service providers can be estimated by adjusting a County-wide growth rate proportionally. If future growth in water demand were based on the DOF population projection (of 1.28%), potential future growth rates for EID and GDPUD can be derived by increasing the DOF projection for countywide growth by 82% and 34%, respectively, as shown in **Table 3-2**.

Table 3-2 Potential Residential Growth Rates Based on Department of Finance Projections (County-wide)

	2030
Projected County-wide Growth	1.28%
Pro-rated growth within EID Service Area[a]	2.33%
Pro-rated growth within GDPUD Service Area[b]	1.72%

SOURCE: CDOF(2013)

a. Assuming growth within the EID Service Area is 82% higher than the County-wide rate.

b. Assuming growth within the GDPUD Service Area is 34% higher than the County-wide rate.

When compared to historical growth rates, the rates presented in Table 3-2 appear to be generally consistent. In the GDPUD Service Area, the average annual growth was approximately 3.1% from 1990 to 2000 (GDPUD 2011, p. 11) and 1.8% from 2000 to 2010 (per Table 2-8). For EID, a growth rate of 2.5% was reported between 1988 and 1999 (EID 2006, p. 3-2) and 2.44% from 2000 to 2010 (per Table 2-8). Despite the general consistency with historical growth patterns, given ongoing economic uncertainty, the growth rates presented in Table 2-8 for EID and GDPUD may be too high.

Growth rates used in recent water purveyor planning documents (included in Table 2-8) have ranged from 0.40% to 2.83% for EID, 1.69% to 1.97% for GDPUD, and 1.48% to 2.7% for GFCSD.

As noted above, a growth rate of 1.03% is substantially less than the historic rate of growth for EID's water Service Area and is also lower than the growth rates included in recent water planning reports prepared by EID. Further, the list of pending General Plan Amendments and Specific Plan applications presented in Table 2-7, which are all concentrated in the EID service region, suggests the potential for a sizeable increase in demand within EID's water Service Area. If all of the proposed development (in Table 2-7) were approved and built as planned, the number of residences in the EID Service Area could increase by 7,289 units. Assuming an average household size of 2.64 persons (United States Census Bureau n.d.), this represents an increase of 19,243 persons within the EID Service Area, or an approximate 17% increase above the estimated 2010 population of 110,000 (EID 2011, Table 2-2). For comparative purposes, a total of 4,185 residential units were permitted in the El Dorado Hills, Cameron Park/Shingle Springs, and Diamond Springs market areas from 2000–2011 (bae urban economics 2013, Appendix A).

As discussed above, the 2013 IWRMP included estimates of future water demand for both high-growth and low-growth scenarios (which were included in Table 2-5). **Table 3-3** adds the baseline (2008) for the high growth scenario so that the average growth rates used in the 2013 IWRMP can be calculated.

Table 3-3 Projected Growth in Water Demand within EID Service Area (acre-feet)

Year	*Total Water Demand (AFY)*	
	Low Growth Scenario	*High Growth Scenario* [a]
2008a		46,767
2015	43,398	48,863
2020	45,639	52,092
2025	50,345	59,465
2030	55,136	68,375
2035	61,262	77,315
Growth through 2030 [b]	**1.61%**	**1.74%**
Growth through 2035 [b]	**1.74%**	**1.88%**

SOURCE: EID (2013) IWRMP, Table 9-1.

a. Base year demand included per EID 2013 IWRMP, Table 4-6.

b. Growth rates are calculated averages based on reported projections

The high-growth scenario starts with a baseline year of 2008 and reflects pre-recession demand levels. The low-growth scenario starts with a lower single year demand in 2012, which reflects a similar reduction in water demand experienced by many water agencies during the economic downturn, as noted in Section 2.2.4. These growth rates are lower than used in previous EID planning reports (refer to Table 2-8) and appear to incorporate the effects of a slow economic recovery. The EID rates are consistent with the historic trend of differential growth for those areas where public water supplies are available.

3.1.2 Growth Rate Projections Utilized in this Update

For the purposes of this analysis, **Table 3-4** presents the growth rates adopted for a high-, medium-, and low-growth rate scenario for each of the purveyors and OCAs and is followed by a rationale for each.

Table 3-4 Residential Growth Rate Scenarios Adopted for 2014 Update

	Low	*Medium*	*High*
El Dorado Irrigation District [a]	1.21%	1.74%	2.33%
Georgetown Divide Public Utility District [a]	.89%	1.28%	1.72%
Grizzly Flat Community Services District [b]	N/A	1.03%	N/A
Other county Areas [b]	N/A	1.03%	N/A

a. Reference Table 3-1 and 3-2

b. Growth rate adopted by EDC for the Targeted General Plan Amendment

EID

The pro-rated growth rates for EID, with 1.21% derived from the Targeted Update (in Table 3-1) and 2.33% derived from the State of California DOF (in Table 3-2), are used in this analysis as the low and high range of growth that might occur within the EID water Service Area. For comparative purposes the midpoint of these two pro-rated rates would be 1.77%.

Table 3-3 provides growth rates (aggregated from supply region growth rates) for EID's IWRMP for low- and high-growth scenarios, which range from 1.61% to 1.88%, with a midpoint of 1.74% (essentially the same as the mid-point of the two pro-rated growth rates for EID noted in the previous paragraph). For comparative purposes, the rate of 1.74% is approximately 71% of the historic growth within the EID Service Area from 2000-2010. The rate of 1.74% is used in this analysis for a medium growth scenario for the EID water Service Area including those Favorable Areas reallocated to EID.

GDPUD

The pro-rated growth rates for GDPUD of 0.89% derived from the Targeted Update (in Table 3-1) and the growth rate of 1.72% derived from the State of California DOF projection (in Table 3-2) are used in this analysis to depict the high and low ranges of growth that might occur within the GDPUD Service Area.

To identify a medium growth rate, if future growth is approximately 71% of the previous decade's growth as it was for EID, and considering growth in the GDPUD Service Area was approximately 1.8% from 2000-2010 (refer to Table 2-8), then future growth in the GDPUD water Service Area would be approximately 1.28%. Therefore, the rate of 1.28% is used in this analysis to estimate a medium growth scenario for the GDPUD water Service Area, including those Favorable Areas reallocated to GDPUD.

GFCSD

Projected growth rates (averaging 2.23% through 2035) presented in Table 2-3 for GFCSD used in its 2012 Water Supply and Demand report are high considering an actual reduction in residential connections between 2009 and 2012. This reduction resulted from poor economic conditions and the community's relatively remote location (from Placerville and the Highway 50 Corridor). The Targeted Update West Slope growth rate of 1.03% therefore, is used in this analysis to project future water demand for GFCSD.

Other County Areas

The Targeted Update long term West Slope growth rate of 1.03% is used in this analysis to project future water demand for the OCA.

3.2 REALLOCATIONS OF PROJECTED GROWTH FROM OTHER COUNTY AREAS

The 2007 WRDMP addressed the water supply needs of the West Slope, including areas that are outside existing water service boundaries, collectively referred to as OCA, where water is typically supplied by individual property owners and small privately-owned water providers from wells and springs.

Many factors will determine whether or not municipal water service will be provided to portions of the OCA that have appropriate land use or zoning designations that allow for development. From a water utility perspective, these factors include water supply availability, proximity and physical conditions to connect to an existing system, facility requirements to extend service, potential for improvements to the existing system to accommodate the added demand, and the total cost of providing service, including both capital and operating costs.

The extension of water service from a public water purveyor occurs via an annexation and such annexations are conditioned by the establishment of a “sphere of influence” for the public agency by the appropriate Local Agency Formation Commission (LAFCO). The “sphere of influence” is defined as “a plan for the probable physical boundaries and the service area of a local government agency.”[2] Spheres of influence for public agencies within the County, including the major water purveyors, have been established by the El Dorado County LAFCO.

In the 2004 General Plan, using a GIS model, housing units and related water demand in the OCA were aggregated by Traffic Analysis Zones (TAZs) established for the traffic analysis for the Environmental Impact Report. Based on the assumption that the Service Area of the water purveyors would eventually expand to the “sphere of influence” for each agency, in the 2007 WRDMP, future water demand within portions of the OCA was reallocated to EID and GDPUD. These areas were identified as having “potential” for future annexation and were depicted on Figure 5.8 (of the 2007 WRDMP). Based on this reallocation of TAZs, the 2007 WRDMP identified the potential for up to 14,910 AFY in additional demand for EID and 2,162 AFY of additional demand for GDPUD. Of these amounts 11,040 AFY and 1,318 AFY for EID and GDPUD, respectively, were identified as being provided for by the purveyor at some time in the future. Note, the 2007 WRDMP estimates of reallocated water demand did not consider the vacancy rate, which was imbedded in the 2004 General Plan housing projections, nor did they account for system losses, and thus the projections in the 2007 WRDMP were somewhat understated.

For this update, an updated map of Favorable Areas has been developed (**Figure 3-1**). It depicts the ranges of aggregated water demand for each TAZ. TAZs with new demand of more than 250 AFY (at build-out) and “island areas” (currently unserved areas surrounded entirely by the water purveyor’s existing Service Area boundary) are considered favorable for future water service from EID or GDPUD. Note that only the aggregated demand from vacant lands was included, even though additional demand could occur on already developed lands (e.g., due to failing or low-producing groundwater wells). In addition, a few adjustments were made to eliminate TAZs in the “favorable” category due to the absence of proximate water distribution facilities. A few TAZs with aggregate demand of less than 250 AFY were added as Favorable Areas, based on proximity to Highway 50, completed annexations, and TAZs where at least a portion falls within a designated Community Region (in the 2004 General Plan). Figure 3-1 also depicts areas that have been annexed into the EID and GDPUD Service Areas since 1999 (the base year for the General Plan projections). **Table 3-5** presents the number of new households that fall within the TAZs for which water demand is reallocated to EID and GDPUD based on “Favorable Area” criteria discussed above.

3.3 WATER DEMAND FACTORS

The water demand factors used in this analysis were based on data available from UWMPs, master plans and supplemental information from the water purveyors. In some cases, simplifying assumptions were made for purposes of this analysis and are detailed in the section for each purveyor. Purveyor specific water demand factors were used because each Service Area exhibits unique water demand and growth trends, thus making countywide water demand factors infeasible for use in this analysis.

General descriptions of the water demand categories included in this analysis are described below. The specific source and any variations from these general descriptions are noted below for the individual water purveyors.

Urban Demand: Urban demand is based on historic capita water use or GPCD determined in the 2010 UWMP for EID and GDPUD, and includes all residential, commercial and industrial water use. The capita water use factors identified in the respective UWMPs are applied to the population associated with the 2004 General Plan housing forecasts for each purveyor's Service Area and the Favorable Areas reallocated to the purveyors. Adjustments are made to the historic capita water demand factors to capture projected changes in land use (primarily increased economic activity) envisioned in the 2004 General Plan. This differs from the approach taken in the 2007 WRDMP where demand was calculated by applying residential and per-employee water demand factors to the number of households and employees projected to occur as a result of the 2004 General Plan.

For GFCSD, which is not an Urban Retail Water Supplier, household water use factors are used to estimate demand, consistent with the 2007 WRDMP.

Commercial, Office, and Industrial Demand: Unlike the 2007 WRDMP, separate commercial demand factors are not used for EID or GDPUD for this analysis. As described in the Urban Demand description above, commercial uses are captured in adjustments to the GPCD that are used to calculate urban demand. Adjustments are based on the ratio of urban water demand per household projected in the 2007 WRDMP/2004 General Plan (Appendix B) for the baseline year of the 2004 General Plan and for Buildout. This approach captures urban water conservation required by the State by starting with Target GPCD while also accounting for changes in land use over time by adjusting for increased economic activity. For GFCSD with few commercial uses within the Service Area, no demand factors for commercial uses are applied in this analysis. It is assumed that any demand associated with commercial activities is captured in residential demand. For OCA (not reallocated to the major water purveyors) employee unit demand factors are used, consistent with the 200 General Plan and 2007 WRDMP.

As discussed above, in 2007, the County adopted an increase in the allowable FAR for commercial and industrial uses from 0.25 to 0.85, and for R&D uses from 0.25 to 0.50. The adopted increase in the FAR allows an increase in the size of commercial, industrial and R&D buildings much greater than previously allowed under the 2004 General Plan. This could result in more employees in the County. As discussed in the FAR General Plan Final EIR, the projected increase in employees would generate additional water demand. The Final EIR for the General Plan Amendment A06-0002 (Dec 2006) indicates that:

> *… an additional 13,869 acre-feet of water demand at build out, occurring primarily within EID's service area, will result from the amendment.*

To the extent that water demand projections are based on the 2004 General Plan (without the 2007 FAR amendment), those commercial demands are adjusted in this analysis to account for the allowable increase in the FAR.

Other Authorized Uses and System Losses: System losses are water that is taken into the system from a purveyor's main sources, but "lost" due to leakage or used for authorized purposes but not delivered to the consumers. Authorized purposes include treatment plant and pump station operations and maintenance and sewer line flushing. Additionally, system losses may also be a result of "apparent" losses due to metering or billing system inaccuracies.

Latent Demand: Latent demand includes inactive meters and uninstalled meters, which potentially can generate immediate water demand (EPS 2003). In the 2007 WRDMP, residential water demands (actual) were projected for households and then a water factor for latent demand was added. Because the 2004 General Plan residential growth forecast is based on households rather than total residential dwelling units, latent demand is based on a standard vacancy factor of 5% (which is widely used as a standard assumption for residential vacancies). A decrease in residential vacancy rates would result in an increase in water demand. Thus, latent demand, as reflected by vacancy rates and other system requirements, must be accounted for given the water service is already committed and necessary for inclusion within potential future demand estimates. Other contractual commitments and/or operational requirements are also discussed below in the purveyor-specific discussion.

3.4 AGRICULTURAL LAND USE AND CROP WATER USE

As part of the 2004 General Plan, preliminary estimates of future agricultural water demand were developed by Wood Rogers in 2003, based on mapping of all "Important Farmland" on the western slope below 3000 feet in elevation. The 2004 General Plan included an alternative estimate of agricultural demand developed by EPS, based on information provided by the water purveyors. The 2007 WRDMP included the results of a mapping exercise conducted by ECO:LOGIC that refined the extent of agricultural lands included in the preliminary analysis conducted by Wood Rogers in 2003. Agricultural water demand projections presented in the 2007 WRDMP were based on the land use capacity of "Choice Farmland," as defined by the 2004 General Plan. These are within and outside Agricultural Districts, on parcels greater than 10 acres with a 10% allowance for roads and buildings, and outside urbanized areas and designated "Community Regions". They include a crop mix and growth rate developed in consultation with the El Dorado County Agricultural Commissioner. Note that several hundred acres of new plantings were anticipated at that time but did not materialize during the recent economic downturn.

For this update, agricultural land uses are limited to parcels greater than 10 acres within the Agricultural Districts designated in the 2004 General Plan, but not including the expansion of those Districts proposed in the Targeted General Plan Update. The exclusion of parcels as small as 1 acre from this analysis likely understates the potential for agricultural land development in the County, as currently there is considerable agricultural activity on parcels smaller than 10 acres. In addition, to be conservative, agricultural growth rate projections from the 2007 WRDMP have been reduced by half for this analysis.

Agricultural land use projections for EID, GDPUD, and OCAs are presented in **Table 3-6**. A current inventory of agricultural land use is not available, therefore, the 2004 General Plan base year of 2000 (for agricultural land uses) is used as the starting point, consistent with the 2007 WRDMP.

Table 3-6 El Dorado County Historical and Projected Future Irrigated Agricultural Land Use[d]

Location	***2000***	***2030***	***2050***	***Build-Out***
	Area (acre)	***Area (acre)***	***Area (acre)***	***Area (acre)***

Acreage represents irrigated agriculture.

a. Assumed growth rate of approximately 2% per year for 2010-2030 and 1.5 % per year for 2030-2050 for EID.
b. Assumed growth rate of approximately 2% per year for 2000-2030; 1.5% per year for 2030-2050 for GDPUD.
c. Assumed growth rate of approximately 1.5% per year for 2000-2030; 2% per year for 2030-2050 for OCA.
d. Build-out acreage from 2007 WRDMP, Table 4-7.

The irrigation water to support the projected growth in agriculture is based upon the application of water duties (or average water use values) by crop category as presented in **Table 3-7**. These water duties are composite values based on DWR data and local agricultural community experience on properties utilizing Irrigation Management Services (IMS), initiated in 1977, operated for growers by EID and EDCWA. The IMS programs apply irrigation efficiencies for centralized irrigation systems that use soil moisture probes to monitor and manage irrigation and minimize water use. Therefore, these duties already reflect the efficiencies of agricultural irrigation best management practices such as drip irrigation. The EID and EDCWA IMS programs are discussed in more detail in Chapter 5.

Table 3-7 Agricultural Water Duties

Crop Category	***Water Use***
Deciduous orchards[a]	2.8 acre-feet/acre
Vineyards, Christmas trees, olive/citrus, and berries [a]	1.3 acre-feet/acre
Pasture Irrigation[b]	N/A
Alfalfa (Reference Crop) [c]	4.6 acre-feet/acre

SOURCE: UCDavis (2009)

a. Composite values based on DWR data and local agriculture community experience

b. Assumes no new growth in the Pasture Irrigation category.

c. Alfalfa water use provided for reference only UCDavis (2009)

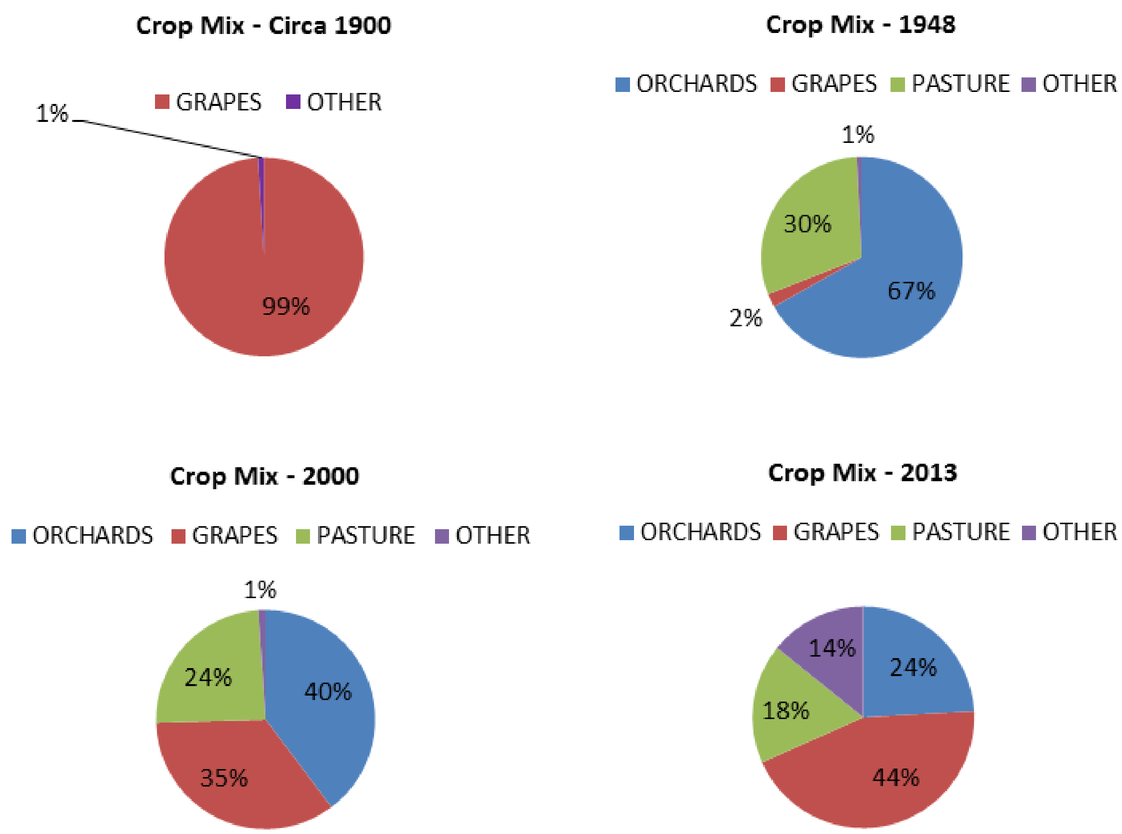
Agricultural land and water use in El Dorado County has varied over the last century based on crop mix, water availability, and irrigation efficiency. Cultivated acreage in El Dorado has been as high as 9,300 acres in 1975 and today there is approximately 5,300 acres under cultivation (up from 4,826 acres in 2000). The decline from 1975 is primarily a result of declining irrigated pasture.

Cropping patterns have been and continue to be dynamic in the County as supply and demand for certain crops and economic conditions change. For example, El Dorado County was a major grape growing center from 1849 to 1904, with production of 60,000 gallons of wine reported in 1890. But various events, including an economic depression in 1890, the Eighteenth Amendment to the US Constitution (which instituted Prohibition), the Great Depression, and a phylloxera pest invasion in the 1930's, drastically reduced vineyard acreage with only a single vineyard reported in 1936.

As grape production declined, growers in the County switched to other crops, most notably pears, with just under 5,000 acres of deciduous orchard reported under cultivation in 1948. Disease and extreme weather events, however, resulted in decline and/or loss of entire crops. For example, in 1958 the County produced approximately 52,000 tons of pears on 3,400 acres, but after pear blight swept through the County, production dropped to 8,500 tons by 1965 (Apple Hill® Growers Association 2013).

In 1964 the County Farm Advisory and Ag Commissioner met with local farmers to lay the groundwork for the formation of the Apple Hill Growers Association and the "ranch marketing" concept was born. The conversion of pear orchards to apple orchards and grapes has continued since then. In 2000, 451 acres of pears remained within the County, which further declined to 130 acres by 2010, while apple acreage remained essentially unchanged at about 840 acres. During the same period, grape production increased from 1,565 to 2,207 acres. However, a shift away from grapes may be underway as the effects of a new viral disease (red blotch) takes hold in the County. This outbreak could drastically reduce wine grape production, which in turn may result in a return to crops that require more water. These dynamics, unique to agriculture, make projecting future agricultural water demand challenging and warrant a conservative approach to ensuring there is adequate water for agriculture.

Figure 3-2 illustrates the change in countywide crop mix since the turn of the twentieth century. Year 2000 crop mix is included because it is the baseline year for the 2004 General Plan inventory of cultivated land by water purveyor service area and “Other County Areas” (OCA) which is the basis of this update.

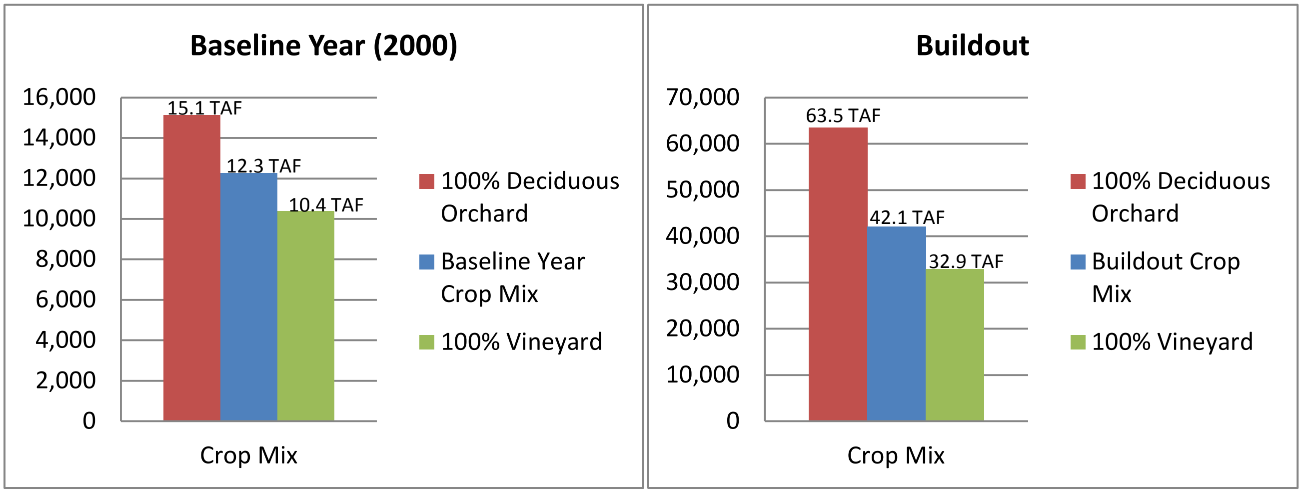


SOURCE: EDC (1948-2013) Agricultural Crop and Livestock Report
Costa (2010) A History of Wine Making in El Dorado County
USDI (2008)

Figure 3-2 El Dorado County Historical Crop Mix – Percent by Acreage

These dynamics make projecting future agricultural water demand challenging as water use varies widely by crop type. To demonstrate the effect of crop type on agricultural water requirements, Figure ES-5 presents three crop mix scenarios for acreage under cultivation in 2000 (baseline) and Buildout: 1) Year 2000 (baseline) crop mix; 2) 100% vineyard with no change in pasture irrigation; and 3) 100% deciduous orchard with no change in pasture irrigation. Water requirements are based on 1.3 acre-feet per acre for grapes, 2.8 acre-feet per acre for deciduous orchard, and no change in pasture irrigation total from the baseline year.

Assuming 100% grapes would tend to under estimate agricultural demand, and assuming 100% deciduous orchard would overestimate demand. From Figure 3-3, the Year 2000 (baseline) crop mix represents a balance between grapes with a lower water requirement and deciduous orchard with a higher water requirement. For this analysis the baseline year crop mix is assumed in projecting future agricultural water demand, except that acreage in pasture irrigation is assumed to stay constant. A similar analysis is presented in Chapter 5 for each area/purveyor.



SOURCE: EDC (2004) Appendix E (EPS 2003 and Wood Rogers 2003)
EDCWA (2007) Table 4-7

Note: Water requirement does not include system losses, which vary by area/purveyor.

Figure 3-3 Crop Mix Water Requirement for Baseline Year and Buildout

Adaptation to adverse conditions by agricultural producers in the County speaks to the region's favorable agricultural characteristics. This adaptability and the following factors contribute to the potential for expanded agricultural land uses in the County:

- General Plan policies are protective of agricultural operations in terms of adjacent compatible uses and allow ranch marketing activities by right
- The high cost of agricultural land elsewhere will make the County more attractive to producers
- Crop diversification in the "Apple Hill" area, including apples, cherries, wine grapes, peaches, nectarines, and Christmas trees fuel ranch marketing operations that draw more than 35,000 visitors to the County each year.
- Total crop production value in El Dorado County was $57 million in 2013, representing a 20% increase from 2012 and up from $53 million in 2000. (EDCDAWM, 2000/12/13).
- The Agricultural Commissioner estimates that agriculture and related activities contributed approximately $441 million to the County economy in 2013, of which ranch marketing and value-added products contributed about $222 million, up from $159 million in 2012 and the wine industry $179, up from $169 million in 2012 (EDCDAWM, 2013,2014)

For this analysis, the crop mix in 2000 (the base year for the 2007 WRDMP/2004 General Plan) for each purveyor's Service Area and the OCA is used to partially capture a potential shift back to more water intensive crops. Water use projections for each purveyor and OCA are discussed in Chapter 4.

Refer also to the 2007 WRDMP (including Section 4.5 and Table 4-7) for a more detailed discussion of the criteria used in determining the land areas considered within the Agricultural Districts and water duties used in this analysis.

[THIS PAGE INTENTIONALLY LEFT BLANK]

Chapter 4. Demand Projections

4.1 INTRODUCTION

As noted above in Section 2.1, recently the State of California has required that Urban Water Management Plans include an estimate of “baseline” water demand (reflecting average per capita demand over a recent five-year period), an estimate of the “target” water demand (calculated via 1 of 4 methods), and a water use reduction plan to demonstrate how the per capita target demand will be achieved. For the purposes of this update, demand associated with both the baseline and target GPCD factors are included in this analysis.

As the development of per capita water demand factors has become more common, these factors are an increasingly useful tool for planning and comparative purposes. However, the use of per capita demand factors has some limitations for long range planning. They do not capture future land use, or cover agricultural water use (which is relevant to the West Slope purveyors). Comparisons to older studies and reports are difficult because they do not include per capita residential demand factors. In addition, EDCWA has traditionally based demand projections on the number of households and employees, which is consistent with the adopted 2004 General Plan.

Given the widespread use of per capita demand factors (largely for just residential growth forecasts, but also for combined forecasts), this analysis estimates “urban” water demand (including residential, commercial and industrial uses for EID and GDPUD) based on both the 20x2020 baseline and target per capita factors developed by those agencies. For EID and GDPUD, the baseline and target factors are adjusted for use in this analysis to reflect conditions specific to each. For GFCSD and water demand in the OCA, per capita demand factors are not available and therefore this analysis relies on more traditional methods to estimate urban demand. There are advantages and disadvantages to this approach. As implementation proceeds statewide in response to SB X7-7, a more uniform technical approach may become more common. This methodology is expected to be revisited at the next update.

This update includes a range of growth projections (low, medium and high) for the major water purveyors and a single growth rate for OCA and GFCSD. For EID and GDPUD, because both the baseline and target per capita water demand factors are included for the figures that illustrate future water demand projections, “baseline” demand is illustrated only for the medium growth rate scenario for reference. Baseline demand assumes that per capita water demand is unchanged from the historical average reported in the respective UWMPs. The use of the target demand factors reflect an assumption that the reductions in demand embedded in those factors will be achieved by the respective water purveyors. The demand charts illustrate all three growth scenarios (low, medium, and high), and quantify projected demand only for the medium growth scenario. This reflects another conservative assumption that the high growth rates experienced in recent years in some areas (e.g., El Dorado Hills) are not sustainable over the long term. While growth rates tend to average out due to economic cycles, such recent dramatic changes in growth rates are largely unprecedented in the region. This is another subject that is expected to be revisited at the next update.

As discussed above in Section 3.4, agricultural water demand is based on projections of irrigated acreage by crop type and water duties for those crop types.

4.2 EL DORADO IRRIGATION DISTRICT

For the 2010 UWMP and 2013 IWRMP, EID developed water use factors for land uses included in the 2004 General Plan, based on historical water demand within EID's service zones (EID 2013, p. 87). Single-family residential land uses, including high-, medium-, and low-density, and rural residential, were assigned density factors which represent the average density for each land use category, respectively, as described in the 2004 General Plan. The water use factors were based on EID's design standard household unit use and reflected the different demands for each of the three supply regions (eastern, western, and El Dorado Hills) in the EID water Service Area, where demand varies due to differences in elevation, growing season, and the extent of irrigated landscaping in commercial land uses. For other land use types (e.g., commercial, industrial, and multifamily residential), data from EID's 2006 Consumption Report was used in combination with existing parcel data to generate use factors for each service region. Table 2-8 presents the results of the 2013 IWRMP projections for the entire EID Service Area for a low- and high-growth scenario (based on growth rates developed by EID for the 2013 IWRMP).

For the purposes of this update, urban per capita water demand factors developed in EID's 2010 UWMP are used to calculate total demand from all residential, commercial and industrial uses in the EID Service Area including demand from Favorable Areas. As a result of annexations to EID's Service Area between 1999 (the baseline year for the 2004 General Plan) and 2008 (the baseline year for the 2010 UWMP), a portion of demand from the “Favorable Areas” is reflected within EID's demand projections. The effect of the 2007 FAR General Plan Amendment, however, is not included in the EID projections. Note that this is not a defect in EID's UWMP or IWRMP. Unlike the long range planning nature of EDCWA's work, EID's water plans are used for a shorter-term 20- to 25-year planning horizon for capital and infrastructure development. These plans are updated regularly and capture changing land use conditions in a timely manner for those purposes.

EDCWA's planning for the water supply needed for the County must look beyond the 20- to 25-year planning horizon to the total build-out capacity of the 2004 General Plan that will develop over many decades. Because this analysis is a “big picture” look at water demand, the projections presented herein are for the EID water Service Area (including Favorable Areas) using aggregated growth rates (instead of different rate for each EID service region) as discussed Section 3.1.2 of this report.

4.2.1 Existing Urban Demand

Urban per capita water demand factors for the EID Service Area from the 2010 UWMP are presented in **Table 4-1**. Urban per capita water demand includes residential, commercial, industrial and commercial irrigation (turf irrigation), authorized uses and system losses, and is divided by a population estimate to derive per capita water use. Table 4-1 includes a baseline, mid-term 2015 (which is required to reflect a 10% decline in demand), and a 2020 target that reflects a 20% reduction (from the baseline) as required by SB x7-7, Method 1.

Table 4-1 El Dorado Irrigation District Baseline and Target per Capita Water Use Factors

Historic Baseline (GPCD)	*2015 Target (GPCD)*	*2020 Target (GPCD)*
281	253	225
SOURCE: EID (2011).		

Per Capita Demand Adjustments

The adopted 2004 General Plan will permit an increase in commercial land uses, in terms of both acreage and intensity, within the EID water Service Area. In addition, the 2004 General Plan will also allow an increase in housing in the more western portions of the County that will shift the concentration of population within the EID water Service Area from the higher elevation eastern region (where GPCD is the lowest) to the lower El Dorado Hills regions (where GPCD is the highest). While water use in the western portion of the County is more intense, the housing mix will also change over time to more multi-family housing as a percentage of total housing which negates any increase in demand. Based on a comparison of the base year and buildout 2004 General Plan's housing and employment/jobs projections and associated water demand projections (Appendix A) presented in **Table 4-2**, GPCD is projected to increase by approximately 8% by buildout.

Table 4-2 Projected Change in Urban Water Use per Household at Buildout (acre-feet)

Households/Type of Demand	*Baseline Year*	*Buildout*		
		Service Area	*Favorable area*	*Total*
Residential Household	28,811	72,075	13,152	85,227
Residential Demand	18,934	46,023	9,606	55,629
Commercial Demand	2,637	11,566	1,805	13,371
Total Demand	21,571	57,589	11,411	69,000
Water use per household (af/hh)				
Residential water use per household	0.66			0.65
Change due to demographic/housing mix changes				-0.68%
Residential and commercial water use per household	0.75			0.81
Total change due to demographic/housing mix and increased commercial activity				8.13%

SOURCE: EDC(2002) El Dorado County Land Use Forecast for Draft General Plan.
Note: Reference Appendix B for 2004 General Plan baseline and buildout water use. Water use does not include system losses or latent demand.

As noted above, for the 2010 UWMP, EID used all active residential accounts, with and without water usage, to determine the population within their water Service Area. Thus, the baseline gallons per capita per day demand factor presented in the UWMP does not account for a residential vacancy factor of approximately 5%. The result is an understated GPCD baseline. While not critical for EID's shorter term planning horizon, for EDCWA's long range planning purposes it is important to capture all factors that may affect future demand.

To generate updated water demand projections for EID using per capita water factors, the changes in land use patterns and residential vacancy rates must be considered when determining the ultimate need for water. Based on these factors the adjusted target demand factor for EID is 237 for the 2020 demand projection and 255 GPCD for buildout as shown in **Table 4-3**. The adjustment for increased economic activity is phased in over the planning horizon for each growth rate scenario. For comparison purposes and methodology validation later in this section, Baseline GPCD with the same adjustments as presented in **Table 4-3** is carried through this analysis.

Table 4-3 El Dorado Irrigation District Water Use Adjustments for Increased Economic Activity

	2010 UWMP GPCD	*Adjustment for Residential Vacancies*	*Adjusted GPCD for 2020 Projection*	*Adjustment for Increased Economic Activity*	*Adjusted GPCD for Buildout Projection (gpcd)*
Target	225	5.14%	237	8.13%	255

Note: Baseline GPCD would be 318 with these adjustments and is noted here for comparison purposes and methodology validation use.

4.2.2 EID Population Projection

Total urban demand for EID can be derived by multiplying the adjusted (per capita) water demand (from Table 4-3) by total residential population within the existing EID Service Area and the Favorable Areas reallocated to EID. Population estimates are derived from the number of households projected to result from buildout of the 2004 General Plan and 2.64 persons per household, as shown in **Table 4-4**. (Note for EID, an additional 500 households is included to account for a small area in Sacramento County that is within the EID Service Area). In addition a portion of the "Favorable Areas" shown in **Table 4-4** has already been annexed into EID's water Service Area. As discussed in Section 2.4 approximately 5,000 acres or 2,900 equivalent dwelling units (or household equivalents) have been annexed to EID since 1999. Although a portion of the demand from these annexations may already be reflected in current water demands, annexations do not affect total demand at buildout (based on the 2004 General Plan).

Table 4-4 El Dorado Irrigation District Buildout Population Projections

	Households[a]	*Capita/Household*[b]	*Population*
Service Area	72,508	2.64	191,421
Favorable Areas	13,152	2.64	34,721
Total	***85,660***	***2.64***	***226,142***

SOURCE: EDC (2002) County Land Use Forecast for Draft General Plan
USCB (2014) US Census Quick Facts

a. Households based on the adopted 2004 General Plan with 500 households added for Sacramento County area within EID service area. Households equal 95 percent of total dwelling units. The additional dwelling units water use is captured by applying a latent demand factor when calculating total demand.
b. Capita/Household based on US Census Bureau Quick Facts 2014, El Dorado County.

Figure 4-1 provides a chart of population growth for the EID Service and Favorable Areas based on the low, medium and high growth rates discussed in Section 3.1.2. Note the population forecast does not have a constant slope due to the composite makeup of the curves. Prior to the inflection point, the curve is an aggregate of population growth within both the Service Area and the Favorable Areas (which are assumed to be annexed to EID). After the inflection point, residential land uses within the Service Area have reached buildout (to the maximum densities allowed in the 2004 General Plan) and additional growth would only occur within the Favorable Areas. Although development may not occur exactly in this manner, the estimated total population reflects the maximum growth allowed for the land uses and densities included in the 2004 General Plan.

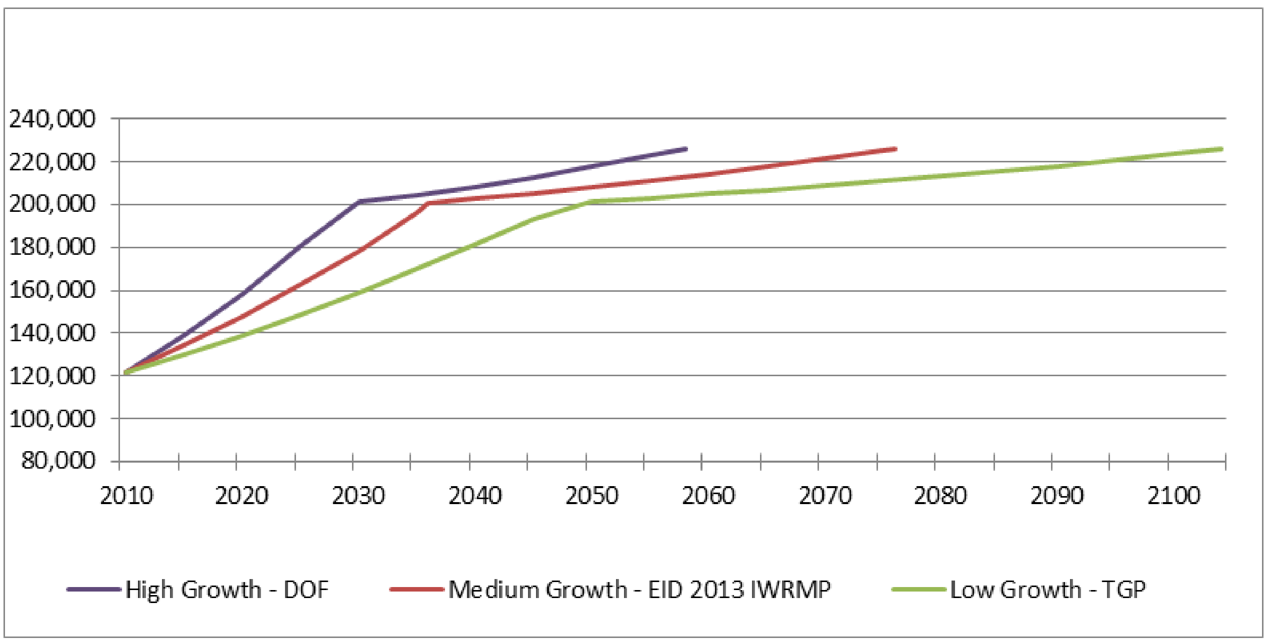


Figure 4-1 El Dorado Irrigation District Service Area and Favorable Area Population Forecast

4.2.3 EID Urban Demand Projection

In order to calculate demand associated with the population growth, the adjusted target GPCD factor from Table 4-3 are applied to population estimates to determine the Service Area and Favorable Area urban water demand shown in **Table 4-5**. The calculated Service and Favorable Areas projections have also been adjusted to include latent demand of 5%.

The Final EIR for the FAR General Plan Amendment identifies 12,621 acre-feet of additional water demand within the EID's Service Area and Favorable Areas to serve commercial needs. For this demand, system losses of 13% are included, consistent with the system loss percentage identified in the 2010 UWMP and 2013 IWRMP. For service and favorable area water demand, system losses are imbedded in the GPCD calculation.

Table 4-5 El Dorado Irrigation District Urban Buildout Demand Projections

	Baseline (acre-feet)	***Target (acre-feet)***
Service Area[a]	71,851	57,480
Favorable Areas[a]	13,033	10,426
FAR General Plan Amendment[b]	14,262	11,409
Total	***99,146***	***79,316***

a. Includes latent demand of 5%.
b. Includes 13% for system losses.
Note: Adjusted baseline GPCD (318) demand calculations are included for comparison and methodology validation purposes only.

Based on the population forecast scenarios presented in Figure 4-1, **Figure 4-2** provides the corresponding water demand projections for the high, medium and low growth scenarios discussed in Section 3.1.2. The starting point for the urban baseline demand is 42,750 acre-feet in 2010 and is shown for reference relative to the target demand. Only the medium growth scenario is shown for the baseline scenario. The starting point for the target demand scenarios is 2012 with the most current published demand information. The total (urban and ag) "potential" demand in 2012 was estimated to be 48,500 acre-feet and includes normalized active, latent and other demands as defined in the EID 2013 Water Resources and Service Reliability Report, Table 1 and

14. Urban demand for 2012 of 40,200 acre-feet is a prorated value based on relative 2012 urban and agriculture consumption data. Note that demands in 2012 are below normal as a result of the economic downturn as discussed in Section 2.3.1.

As for the population estimates, the demand forecasts do not have a constant slope, in part due to the composite makeup of the population projections (where population growth slows after build-out is reached within the Service Area). In addition, the underlying demand calculations assume gradual reductions in water demand between 2012 and 2020, as EID makes progress toward reaching its 20 percent conservation goal embodied in the target GPCD factor. In addition, the water demand estimates include a gradual increase in demand (over the entire time period needed to reach build-out conditions) associated with the increase in commercial space allowed by the FAR General Plan Amendment.

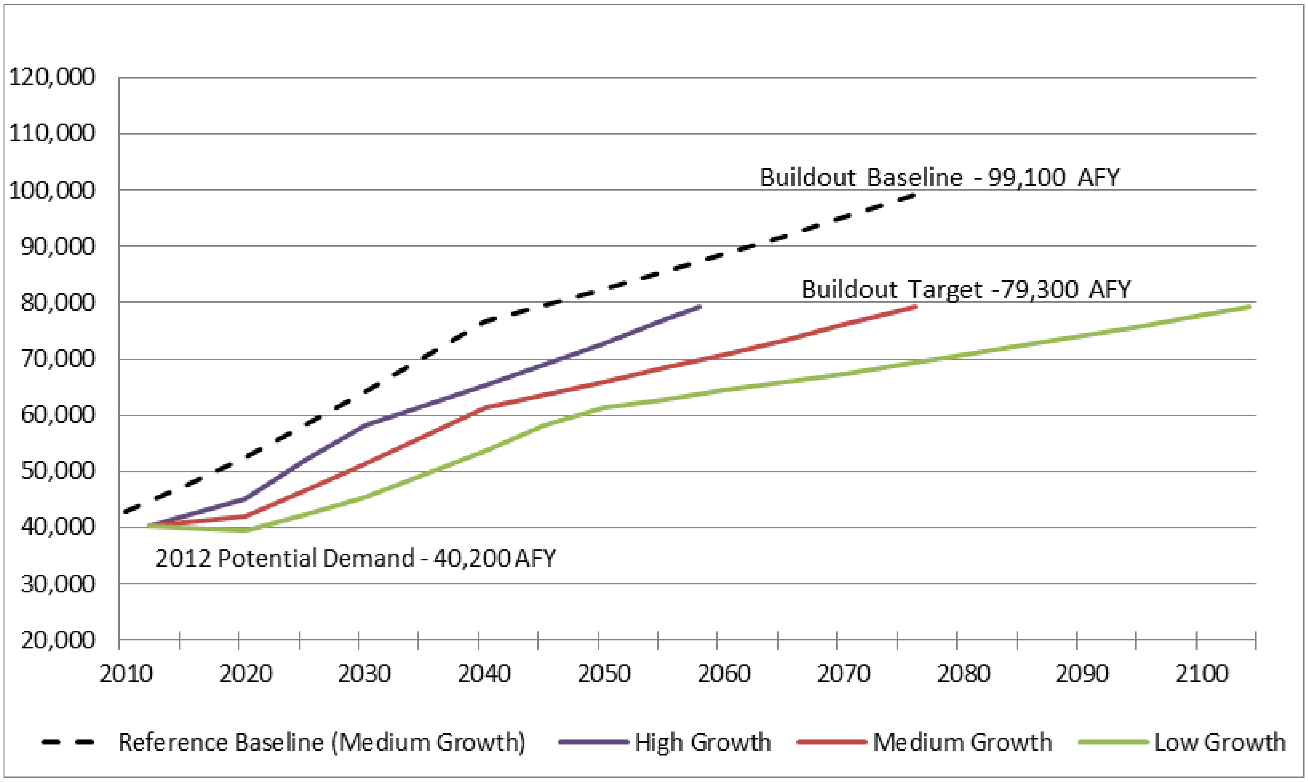

Figure 4-2 El Dorado Irrigation District Service and Favorable Area Urban Water Demand Projections (acre-feet)

4.2.4 EID Agricultural Demand Projection

For the 2007 WRDMP, agricultural demand projections were based on an expansion of agricultural uses and land use capacity of “Choice Farmland” as identified in the 2004 General Plan. For the EID 2013 IWRMP, agricultural water demand projections were based on historic land use and historic water duties, limited to those parcels that had existing agricultural uses. For this analysis, the 2007 WRDMP methodology is employed, but only lands located within the Agricultural Districts are included, as discussed in Section 3.5.

Table 4-6 provides an updated agricultural land and water use projection for the EID Service Area. The cultivated acreage for each crop category (from Table 3-6), and water use assumes water duties (presented in Table 3-7) and a crop mix similar to the base year of approximately 50% “Deciduous Orchard” category and 50% “Vineyard, Christmas Trees, Olive/Citrus, Berries” category with no increase in the “Pasture and Other” category. These water demands reflect the establishment of permanent crops with full utilization of best irrigation management practices, including soil moisture monitoring. For this category, very limited water supply cutbacks may be possible, but fallowing is not a feasible option.

Table 4-6 El Dorado Irrigation District Irrigable Land and Water Use Projection

	Cultivated Area (acre)	*Crop Water Use[a] (acre-feet)*	*Water Demand[b] (acre-feet)*
Deciduous Orchards	3,578	10,020	11,517
Vineyard, Christmas Trees, Olive/Citrus, Berries	3,578	4,652	5,244
Pasture and Other[c]	539	2,048	2,366
Total	***7,696***	***16,720***	***19,218***

a. Based on water duty of 1.3 acre-feet/acre for vineyards, Christmas trees, olive/citrus, berries and 2.8 acre-feet/acre for deciduous orchards.
b. Includes unaccounted water of 13% for system losses.
c. Assumes no net increase in this land use category.

To demonstrate the effect of cropping pattern on water requirements, Figure 4-3 presents baseline water demand (for the crop mix presented in Table 4-6) and estimated demand for 2 conceptual crop mix scenarios: (1) 100% vineyard, Christmas trees and olive/citrus; and (2) 100% deciduous orchard (with no change in pasture irrigation for either scenario). This suggests that the projected crop mix for the baseline year represents the approximate mid-point in the theoretical range of agricultural water demand.

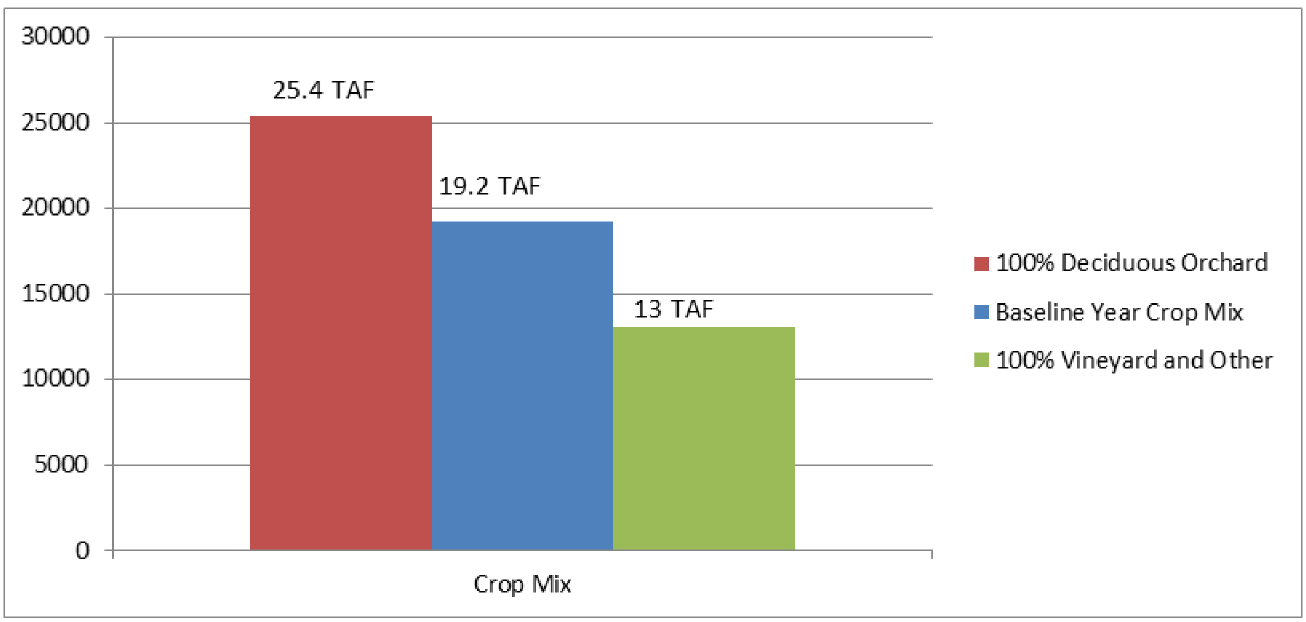

Figure 4-3 El Dorado Irrigation District Service Range of Potential Agricultural Demand (acre-feet)

4.2.5 EID Demand Projection Summary

Table 4-6 presents total estimated/potential water demand for EID for 2012, 2030 and buildout conditions, comprised of urban and agricultural demand, based on the adjusted target GPCD factor (from Table 4-2), the medium growth rate scenario, and agricultural demand based on the crop mix and water duties. Note that the total Service Area potential demand in **Table 4-7** is higher than the sum of actual 2012 raw water diversions (2012 Diversion Report) and recycled water production (2013 Water Resources Report) of 39,000 AFY. The difference is due to many factors, some concrete and others subjective including:

- use of historic averages in calculating potential demand;
- inclusion of latent demands in calculated potential demand;
- lingering effects of the economic downtown;
- recent restructuring and increase in EID water rates; and
- annual hydrologic variation affecting irrigation requirements.

Caution should be exercised in using only one year of data for long range planning purposes because of the variables that can affect demand in any given year. To demonstrate this variability, actual 2008 diversions and recycled water production totaled 48,500 AFY as compared to 39,000 AFY in 2012. For this reason, good water resources planning practice dictates the use of normalized demand values to dampen out the effects of hydrologic variation and other unusual events. In any case, the lower 2012 diversions, at least in part, reflect permanent progress made toward meeting the 20% conservation goal and the target projections in this update. Note 2012 agricultural demand does not include demand supplied from private groundwater or riparian sources.

Table 4-7 El Dorado Irrigation District Urban and Agricultural Water Demand Projection (Medium Growth Scenario) (acre-feet)

	Urban			*Agriculture*			*Total Demand*		
	2012	***2030***	***Buildout***	***2012***	***2030***	***Buildout***	***2012***	***2030***	***Buildout***
Service Area	40,237	49,438	57,480	7,977	9,515	19,218	48,214	58,953	76,699
Favorable Areas		1,966	10,426					1,966	10,426
FAR GP Amend.			11,409						11,409
Total	***40,237***	***51,404***	***79,315***	***7,977***	***9,515***	***19,218***	***48,214***	***60,919***	***98,534***

Note: 2012 agricultural demand does not include demand supplied from ground water or riparian sources.

Figure 4-4 illustrates the demand projections for EID based on the Target GPCD factor, for the low, medium and high growth rate scenarios, and the medium growth scenario for the Baseline GPCD factor for reference. Also shown are the total 2012 potential demand and the actual raw water diversions and recycled water production required to meet demand in 2012.

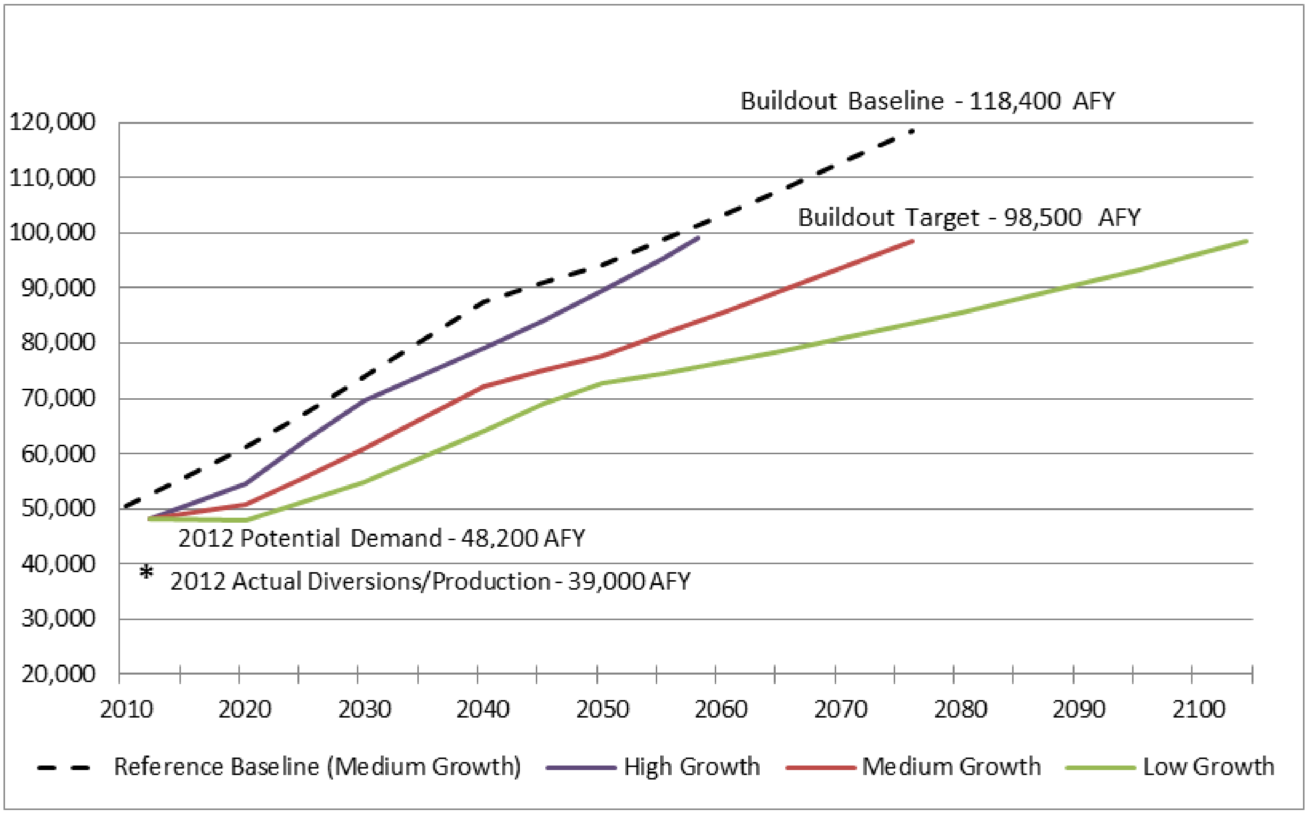

Figure 4-4 El Dorado Irrigation District Urban and Agricultural Water Demand Projections (acre-feet)

4.2.6 EID Demand Projection Comparison

Since completion of the 2007 WRDMP, updated master planning information has been prepared by EID and with the advent of SB X7-7 and the State's requirement to reduce statewide urban water demand 20% by 2020, a completely new methodology is used to project future water demands for this update. With these changes, a comparison of demand projections from these various sources and methodologies can be a useful exercise in validating the projections presented in this update. For comparison purposes, **Table 4-8** provides demand data for the EDCWA 2007 WRDMP, EDCWA Baseline and Target 20x2020 update developed for this update, and EID's 2013 IWRMP. **Figure 4-5** shows the same information in graphical format for ease of comparison. Note that the EID 2013 IRWMP does not include the Favorable Areas or the FAR General Plan Amendment.

Table 4-8 El Dorado Irrigation District Buildout Demand Projection Comparison Acre-feet)

Demand Element	***EDCWA***			***EID 2013 IWRMP***
	2007	***2014 WRDMP Update***		
	WRDMP	***20x2020 Baseline***	***20x2020 Target***

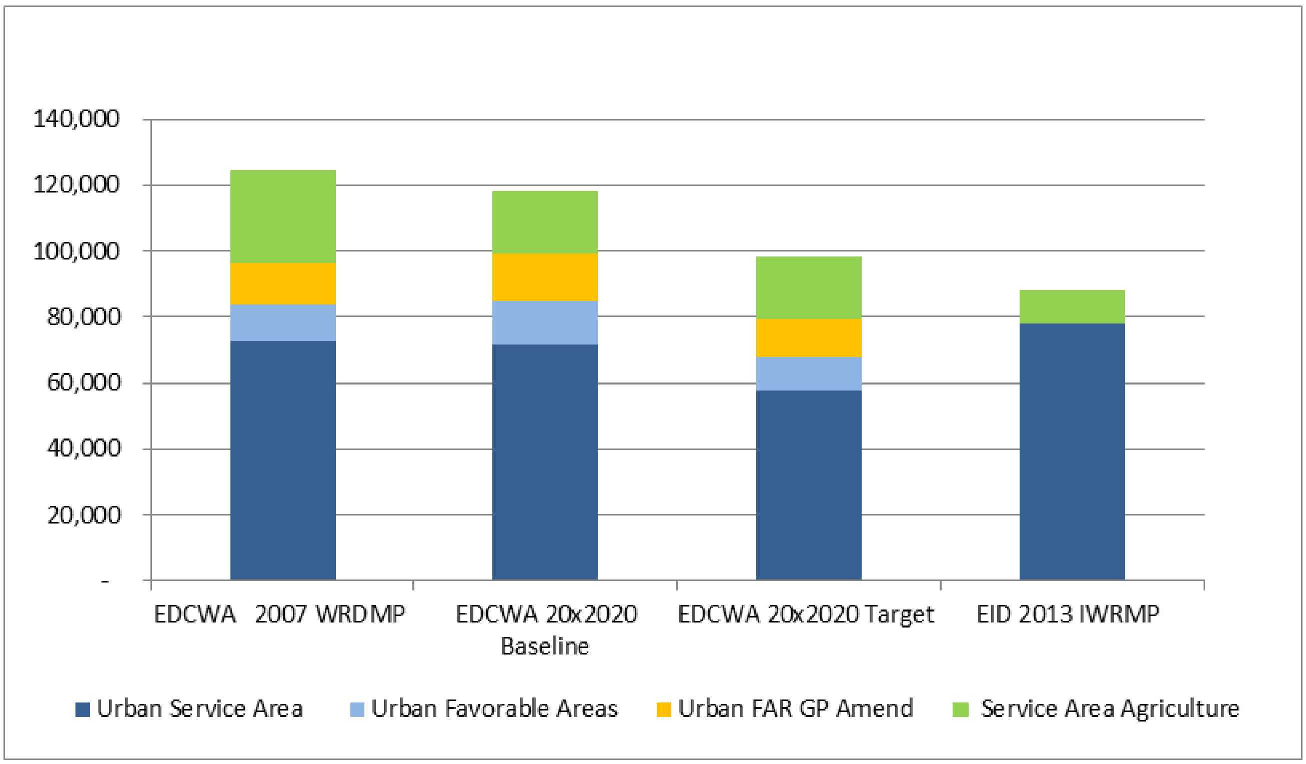

Figure 4-5 El Dorado Irrigation District Buildout Demand Projection Comparison (acre-feet)

4.2.7 Comparisons and Methodology Validation

Using per capita water demand factors to project long term water demand is a departure from the traditional approach, used by EDCWA, of applying separate household and employee unit use factors or water duties to various land use projected over time. There are weaknesses inherent in the per capita methodology that stem from two factors. The first is changes in relative residential and commercial land uses are not captured because per capita demand, as calculated for UWMPs, is based on an historic land use mix, not a future land use mix that may look different over time. In addition, the shift of population from low water use areas in the east to higher water use areas in the west cannot be captured in historic per capita demand factors.

Comparison of EDCWA Urban Demand Projections

In Table 4-2, an adjustment to the future per capita demand factors was made to compensate for these shortcomings. To validate the accuracy of the adjustment factors, a comparison can be made between the urban water demand projections from the 2007 WRDMP (which based demand on household and employment projections) and the estimates for EID developed for this update (based on population estimates and the adjusted Baseline GPCD demand factor). As ultimate buildout within the EID Service Area is based on achieving the land use densities permitted in the 2004 General Plan, demand projections for buildout conditions should be comparable (as buildout conditions are the same for each projection).

Since the 2007 WRDMP based water demand on historical use, a comparison to the water demand derived for the Baseline 20x2020 demand factor (also based on a historic average) are comparable. As shown in Table 4-7, the 2007 WRDMP estimated total urban demand at buildout for the EID Service Area to be 72,831 acre-feet, while the Baseline 20x2020 projection developed for this analysis estimates total buildout demand at 71,851 acre-feet, a difference of approximately 1%. As both projections are comparable, the adjustment of the 20x2020 per capita demand factors incorporated into this update appear reasonable and are validated for long range planning purposes.

Comparison of EDCWA and EID IWRMP Urban Demand Projections

The projections developed for this analysis and those provided in EID's 2013 IWRMP were based on different land use assumptions and unit water use factors and not surprisingly, resulted in different demands for both urban and agricultural uses. For instance, the 2007 WRDMP used 2004 General Plan housing forecasts that assumed the maximum allowable density (with a reduction in density for steep slopes). EID's 2013 IWRMP developed its own methodology based on average land use density, from which water use factors were derived for different land use types. Either method is reasonable for determining long term water needs but do not result in the same demand projections.

As can be seen in Table 4-4, the EID 2013 IWRMP projects significantly greater urban demand within its Service Area than the 2007 WRDMP. This difference can be attributed to the following factors:

- Land area assumptions – A portion of the Favorable Areas have been annexed into EID since 1999, the base year for the 2004 General Plan. Land area in Sacramento County within EID's Service Area is included in the 2013 IWRMP but was not in the 2004 General Plan housing forecast used for the 2007 WRDMP. These differences equate to approximately 3,400 equivalent dwelling units.
- Density assumptions – The 2004 General Plan housing forecast used the maximum density allowed for a specific land use designation with a slope limitation, while the 2013 IWRMP used the average density allowed within each land use designation.
- Unit demand factor assumptions – The 2007 WRDMP used one average household water use factor for each region for all single-family General Plan designations, while the 2013 IWRMP used more refined household water use factors for different single-family residential land uses (with water use per household going up as the allowable parcel size increases).

The combination of differing land area, density and household water use factors used to calculate water demand resulted in a higher "Urban Service Area" demand projection in the 2013 IWRMP.

When comparing the 2013 IWRMP “Urban Service Area” demand to the EDCWA Baseline derived demand projection, the difference is primarily due to the land area and density assumptions discussed above. When compared to the EDCWA Target Demand the difference can be attributed partially to the land use and density assumptions but to a greater extent the anticipated 20% reduction from historical per capita demand used to calculate the Target Demand.

In comparing total urban demand, the inclusion of demand associated with the 2007 FAR General Plan Amendment and Favorable Areas in the SB X7-7 update results in total urban demand being similar for the 2013 IWRMP (78,200 acre-feet) and EDCWA Target Demand (79,316 acre-feet) projections.

Agricultural Demand Comparison

Table 4-7 also shows differences in agricultural demand projections that are primarily due to land area considered. For the 2007 WRDMP, the demand forecast was based on the land use capacity of Choice Farmlands (designated by the 2004 General Plan), both within and outside of the Agricultural Districts (also designated by the 2004 General Plan). Choice Farmland was also used for this analysis, but only those lands within Agricultural Districts were included. For the 2013 IWRMP, a more limited land area was considered, which resulted in a substantially lower projection for agricultural demand. The updated agricultural water demand projection in this document generally represents a mid-point between the projections in the 2007 WRDMP and the 2013 IWRMP.

4.3 GEORGETOWN DIVIDE PUBLIC UTILITY DISTRICT

For the 2010 UWMP, GDPUD used interim and 2020 target per capita water use factors to develop projected urban water demand. For the purposes of this analysis, in order to comply with the requirements of the recent 20x2020 legislation, the 2010 UWMP urban per capita water demand factors are used to calculate total demand for all residential and commercial uses including demand from Favorable Areas (assumed to be annexed to GDPUD). The effect of the 2007 FAR General Plan Amendment, however, is not included in the GDPUD projections. This is not a defect in GDPUD’s UWMP. Unlike the long range planning nature of EDCWA’s work, GDPUD’s UWMP is used for a shorter term 20-year planning horizon for:

> *… development of a capital improvement program to address system reliability that maximizes the availability water supply in the future. [GDPUD 2011, p. 26]*

The 2010 UWMP does, however, qualitatively address the longer term needs of the District and indicates that:

> *The District’s ongoing management practices and conservation programs to reduce losses in the water conveyance system by lining ditches with gunite, replacing ditches with pipelines, and improving operations that affect losses, will have a value in increasing the life of the present water supply. The District estimates that operational losses in the ditch conveyance system account for up to 3,000 acre-feet of water per year. Improved water supply efficiency will decrease the amount of water required from any of the water supply projects under consideration. However, conservation alone will not be sufficient to meet the long-term projected demands within the District’s service area, and eventually, implementation of an additional water supply supplemental to the Stumpy Meadows Project will be necessary. [GDPUD 2011, p. 26]*

EDCWA's water supply planning must look beyond the 20-year planning horizon to the total land use capacity of the 2004 General Plan for the GDPUD Service and Favorable Areas, which could require many decades to be realized.

4.3.1 Existing Urban Demand

Urban per capita water demand factors for the GDPUD Service Area from the 2010 UWMP are presented in **Table 4-9**. Urban per capita water demand includes residential, commercial, commercial irrigation, authorized uses and distribution system losses (excluding treatment plant losses and raw water losses). The total demand was divided by a population estimate to derive per capita water use. Table 4-9 includes a baseline, mid-term 2015, and as allowed by SB X7-7, Method 3, a 2020 target that reflects 95% of the Sacramento hydrologic region target of 176 GPCD.

Table 4-9 Georgetown Divide Public Utility District Baseline and Target per Capita Water Use Factors

Historic Baseline (GPCD)	*2015 Target (GPCD)*	*2020 Target (GPCD)*
197	182	167
SOURCE: GDPUD (2011).		

4.3.2 GDPUD Capita Demand Adjustments

The 2004 General Plan will permit an increase in commercial land uses within the GDPUD water Service Area. Based on a comparison of base year and buildout 2004 General Plan housing/jobs projections and associated water demand projections (Appendix A) presented in **Table 4-10**, increased economic activity is anticipated to increase GDPUD's per capita water use by over 8%.

Table 4-10 Projected Change in Urban Water Use per Household at Buildout (acre- feet)

Households/Type of Demand	*Baseline Year*[a,b]	*Buildout*[a,b]
Residential Households	3,272	11,142
Residential Demand	1,583	5,393
Commercial Demand	247	1,353
Total Demand	1,830	6,746
Water use per Household (acre-feet/hh)		
Residential water use per household	0.48	.48

Change due to demographic/housing mix changes		0%
Residential and commercial water use per household	0.56	.61
Total change due to demographic/housing mix and increased commercial activity		8.25%

SOURCE: EDC (2002) El Dorado County Land Use Forecast for Draft General Plan.
a. Reference Appendix A
b. Water use does not include system losses or latent demand

As noted above, for the 2010 UWMP, GDPUD used all active residential accounts, with and without water usage, to determine the population within its water Service Area. Thus, the baseline GPCD presented in the UWMP does not account for a residential vacancy factor. The result is an understated GPCD baseline. While not critical for GDPUD's shorter term planning horizon (2030), for EDCWA's long range planning purposes it is important to capture all factors that may affect future demand. GDPUD does not differentiate between inactive and active accounts in published reports; therefore it is assumed that the vacancy rate within the GDPUD Service Area is similar to the 5% used for the EID Service Area.

In order to update water demand projections using per capita water use, changing land use patterns and vacancies must be considered when determining the ultimate need for water. Based on these factors, the adjusted target demands is 180, shown in Table 4-11. For comparison purposes and methodology validation later in this section, baseline GPCD with the same adjustments as presented in **Table 4-11** is carried through this analysis. The adjusted baseline GPCD is 225.

Table 4-11 Georgetown Divide Public Utility District Water Use Adjustments for increased Economic Activity

	Demand (GPCD)	*Adjustment for Residential Vacancies*	*Adjusted GPCD for 2020 Projection*	*Adjusted for Increased Economic Activity*	*Adjusted GPCD for Buildout (GPCD)*
Target	158[a]	5.14%	166	8.25%	180

a. Adjusted target GPCD will be higher than 95% of the hydrologic region so target demand is reduced to 80% of the baseline GPCD 197 and then adjustment factors are applied.
b. Baseline GPCD would be 225 with these adjustments and is noted here for comparison purposes and methodology validation.

4.3.3 GDPUD Population Projection

Total urban demand for GDPUD can be derived by multiplying the adjusted per capita water demand (from Table 4-11) by total residential population within the existing GDPUD Service Area and the Favorable Areas reallocated to GDPUD. Population estimates are derived from the number of households projected to result from buildout of the 2004 General Plan and 2.64 persons per household, as shown in **Table 4-12**.

Table 4-12 Georgetown Divide Buildout Population Projections

	Households[a]	***Capita/Household***[b]	***Population***
Service Area	11,142	2.64	29,415
Favorable Areas	1,746	2.64	4,609
Total	***12,888***	***2.64***	***34,024***

SOURCE: EDC (2002) El Dorado County Land Use Forecast for Draft General Plan
USCB (2014) US Census Quick Facts

a. Households based adopted 2004 General Plan. Households equal 95 percent of total dwelling units. The additional dwelling units water use is captured by applying a latent demand factor when calculating total demand.
b. Capita/Household: US Census Bureau Quick Facts 2014, El Dorado County.

Figure 4-6 provides a graphical representation of population growth for the GDPUD Service Area and Favorable Areas based on the low, medium and high growth rates discussed in Section 3.1.2.

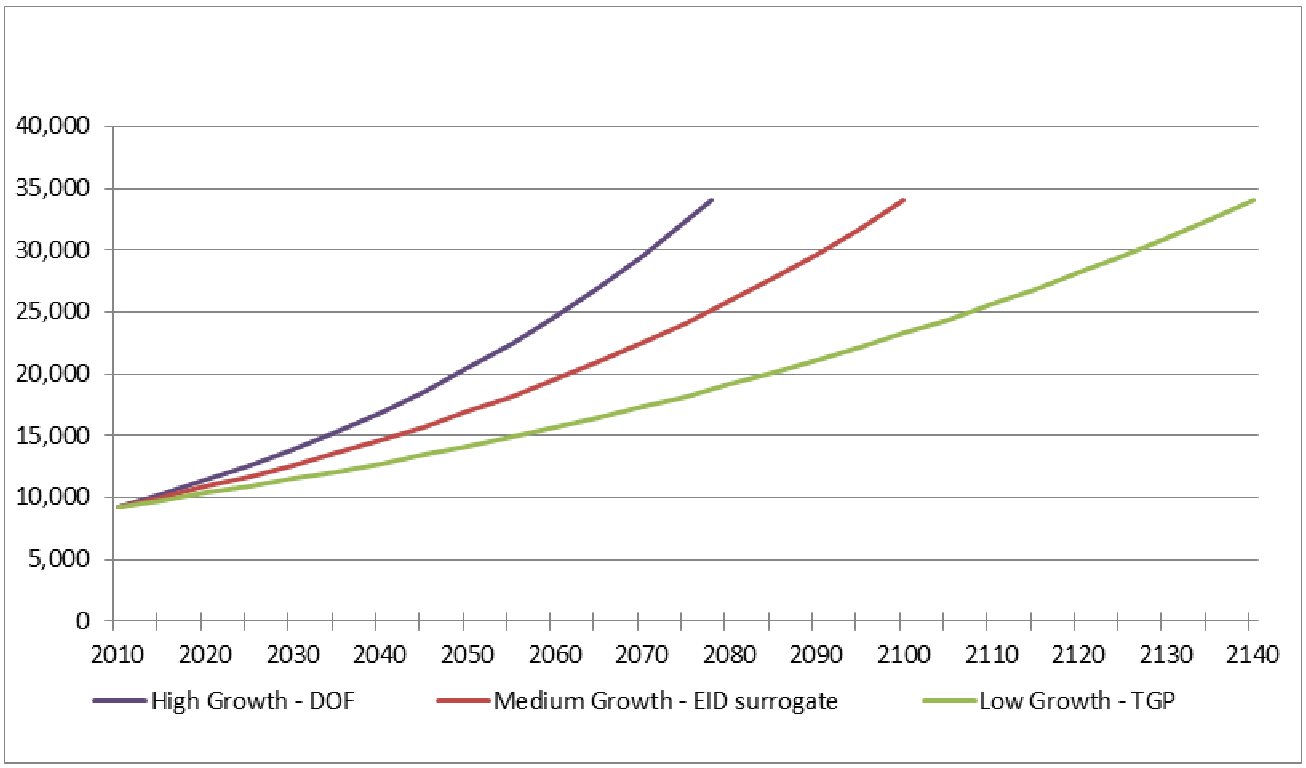

Figure 4-6 Georgetown Divide Public Utility District Service Area and Favorable Area Population Forecast

4.3.4 GDPUD Urban Demand Projections

In order to calculate demand associated with the population growth, adjusted target GPCD factor from **Table 4-10** are applied to the population to determine the Service Area and Favorable Area urban water demand shown in **Table 4-13**. The calculated Service and Favorable Areas projections presented also include factors for system losses and latent demand as defined below.

Service Area Demand

- Treatment process loss of 10% is not included in the 2010 UWMP per capita water use. The treatment process loss is identified in worksheets used to develop GDPUD's annual Water Supply and Demand Report.
- Latent demand of 5%
- Raw water system requirements and losses of 610 acre-feet. Raw water system operational requirement and loss is estimated in the 2009 GDPUD Options to Increase Water Supply report and includes water up, carriage and conveyance losses. Of the estimated 3,050 acre-feet, 20% (610 acre-feet) is attributed to the treated water system.

Favorable Area Demand

- Treatment process loss of 10%
- Latent demand of 5%

2007 FAR General Plan Amendment

The 2007 FAR General Plan Amendment identified the potential for 1,009 acre-feet of additional water demand within the GDPUD Service and Favorable Areas to serve commercial demands. For this demand system losses are also included.

- Treatment process loss of 10%
- Distribution system loss of 5.3 % (based on a 5 year average from worksheets used to develop GDPUD's annual Water Supply and Demand Report Summary reports).

Table 4-13 Georgetown Divide Public Utility District Urban Buildout Demand Projections

	Baseline Demand (AFY)		***Target Demand (AFY)***	
	Adjusted GPCD	***Adjusted GPCD w/system losses and latent demand***	***Adjusted GPCD***	***Adjusted GPCD w/system losses and latent demand***
Service Area[a]	7,408	9,274	5,926	7,542
Favorable Areas[b]	1,161	1,358	929	1,086
FAR General Plan Amendment[c]	1,009	1,192	807	953
Total		***11,824***		***9,581***

a. Includes water treatment process loss of 10%, latent demand of 5% and 610 acre-feet raw water system operational requirement and loss attributed to treated water system.
b. Includes water treatment process loss of 10% and latent demand of 5%.
c. Includes water treatment process loss of 10% and distribution system loss of 5.3%.
Note: Adjusted baseline GPCD (225) demand calculations are included for comparison and methodology validation purposes only.

Based on the population forecast scenarios presented in Figure 4-6, **Figure 4-7** provides corresponding water demand for the high, medium and low growth scenarios discussed in Section 3.1.2. The starting point for the baseline demand is 3,643 acre-feet in 2010 and is shown for reference relative to the target demand. Only the medium growth scenario is shown for the baseline scenario. The starting point for the target demand scenarios is 2012 with the most current published demand information and in part reflects progress made toward meeting the 20 percent conservation goal. The total "potential" urban demand in 2012 was 3,000 acre-feet and includes active, latent and other demands as defined in the GDPUD 2012 Water Supply and Demand Summary supplemented with raw water system requirement and loss data from the Appendix 1 of the 2009 GDPUD Options to Increase Water Supply (GDPUD, 2009). Note that demand in 2012 is below normal as a result of the economic down turn as discussed in 2.3.2.

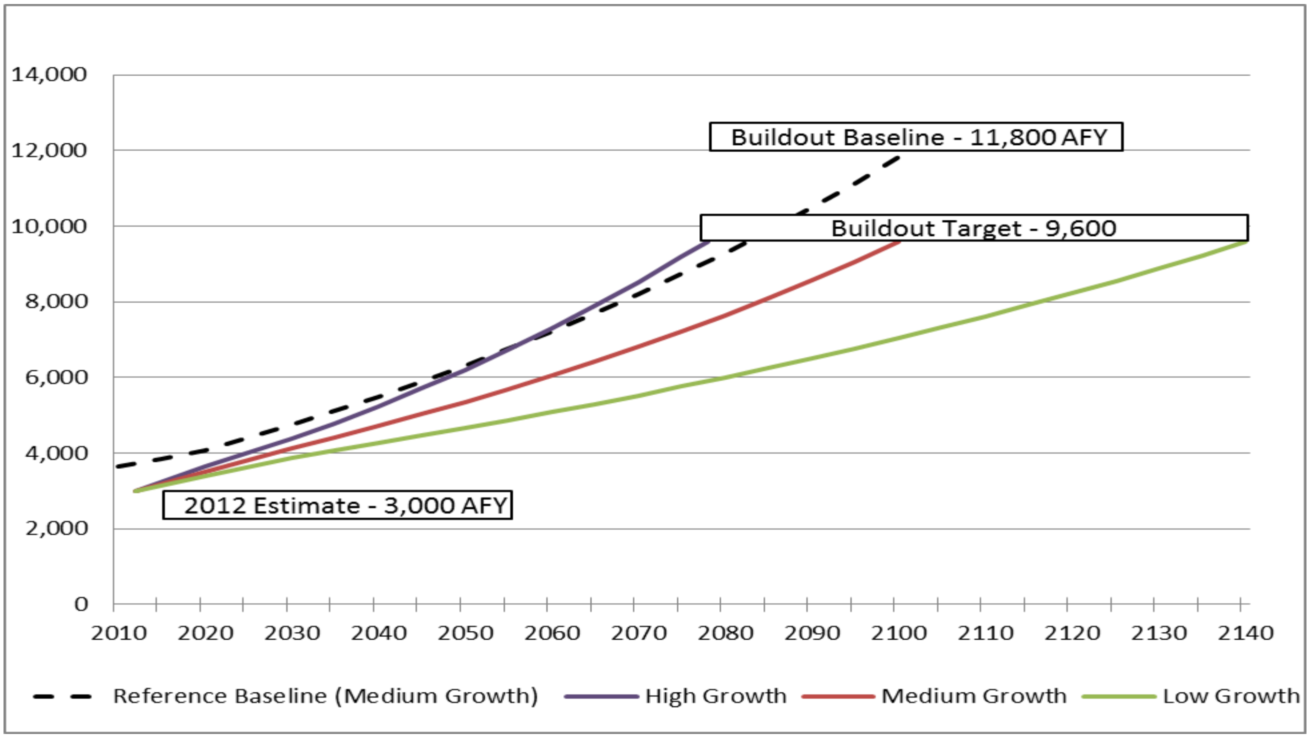

Figure 4-7 Georgetown Divide Public Utility District Service and Favorable Area Urban Water Demand Projections (acre-feet)

4.3.5 GDPUD Agricultural Demand Projection

For the 2007 WRDMP, agricultural demand projections are based on an expansion of agricultural uses and land use capacity of "Choice Farmland" as described in the 2004 General Plan. For this update the 2007 WRDMP methodology is employed but is limited to lands within the Agricultural Districts as discussed in Section 3.4.

Table 4-14 provides an updated agricultural land and water use projection for the GDPUD Service Area. The cultivated acreage in **Table 4-14** is from Table 3-6 and assumes a crop mix similar to the base year of approximately 20% Deciduous Orchard category and 80% Vineyard, Christmas Trees, Olive/Citrus, Berries category with no increase in the Pasture and Other category. The water demands associated with deciduous orchards and vineyards reflect the establishment of permanent crops for which very limited water supply cutbacks may be possible and fallowing is not feasible.

Table 4-14 Georgetown Divide Public Utility District Irrigable Land and Water Use Projection

	Area (acre)	Crop Water Use[a] (acre-feet)	Demand[b] (acre-feet)
Deciduous Orchards	362	1,012	1,342
Vineyard, Christmas Trees, Olive/Citrus Berries	2,049	2,663	3,531
Pasture and Other[c]	1,003	3,810	5,052
Total	**3,413**	**7,909**	**10,349**

a. Based on water duty of 1.3 acre-feet/acre for vineyards, Christmas trees, olive/citrus, berries and 2.8 acre-feet/acre for deciduous orchards
b. Includes 2,440 acre-feet raw water system operational requirement and loss prorated between crop categories
c. Assumes no net increase in this land use category.

4.3.6 GDPUD Demand Projection Summary

Table 4-15 provides the combined buildout urban target and agricultural demand projection with a 2030 demand projection based on the medium growth scenario. It should be noted that the economic downtown beginning in 2008 and a slow recovery resulted in a lower than historic average water demand in 2012. In addition, 2012 demand, representing only one year of data, does not capture the hydrologic variability of urban and agricultural irrigation demands like historic averages do. Note 2012 agricultural demand does not include demand supplied from private groundwater or riparian sources.

Table 4-15 Georgetown Divide Public Utility District Target Demand Buildout Projections (Medium Growth Scenario)

	Urban			Agriculture			Total Demand		
	2012	2030	Build-Out	2012	2030	Build-Out	2012	2030	Build-Out
Service Area	3,001	3,911	7,542	7,121	7,621	10,349	10,122	11,532	17,891
Favorable Areas		209	1,086					209	1,086
FAR GP Amendment			953						953
Total	**3,001**	**4,120**	**9,581**	**7,121**	**7621**	**10,349**	**10,122**	**11,741**	**19,930**

Note: 2012 agricultural demand do not include demand supplied from ground water or riparian sources.

Figure 4-8 provides the combined urban target and agricultural projection from Table 4-15 together with the high and low growth scenario. The baseline demand projection for the medium growth scenario is also included for reference.

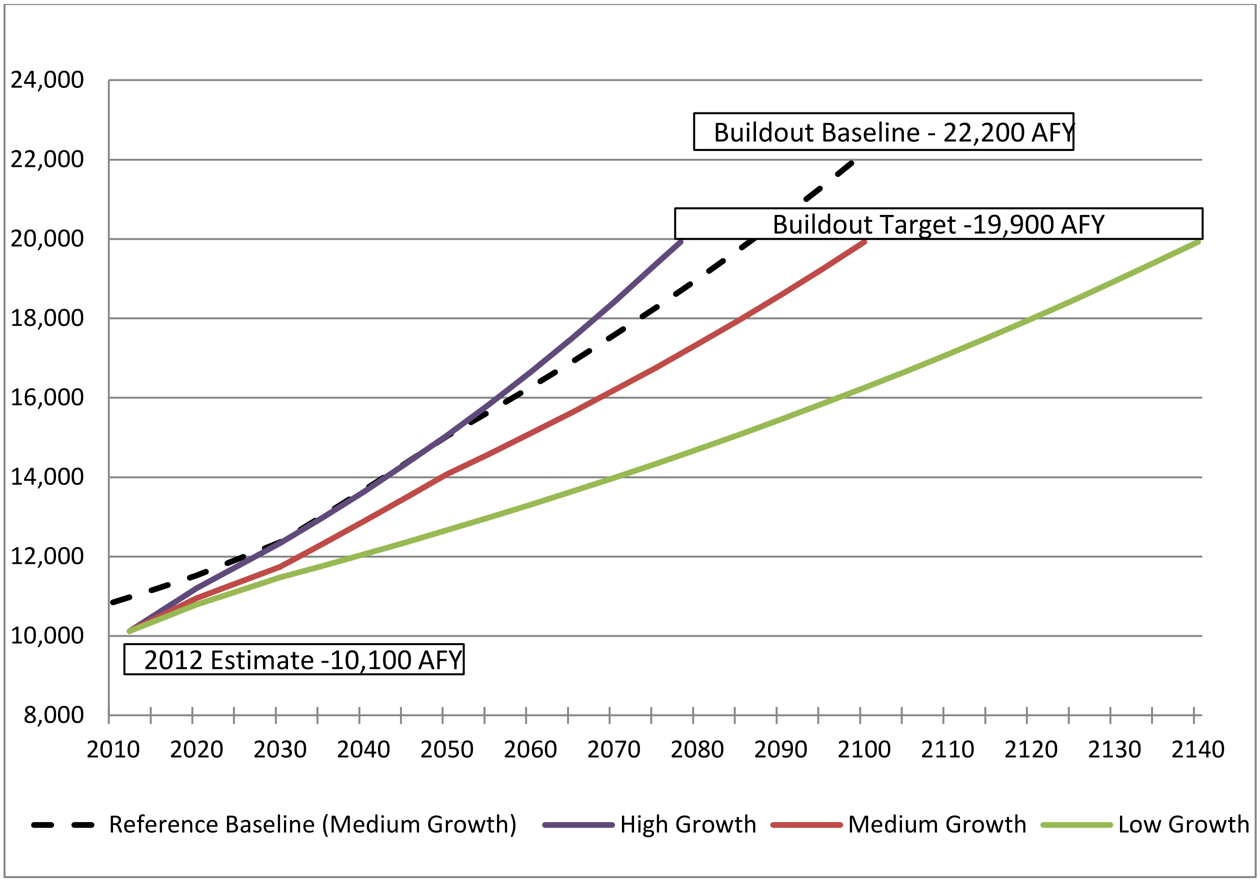

Figure 4-8 Georgetown Divide Public Utility District Service/Favorable Area Urban and Agricultural Water Demand Projections (acre-feet)

4.3.7 Comparison and Methodology Validation

Using per capita water demand factors to project long term water demand is a departure from the traditional approach, used by EDCWA, of applying separate household and employee unit use factors or water duties to various land uses projected over time. There are weaknesses inherent in the per capita methodology for projecting long term water demand for the GDPUD Service Area. The weakness stems from changes in relative residential and commercial land uses not being captured because per capita demand, as calculated for UWMPs, is based on an historic land use mix, not a future land use mix that may look different over time. With this change in methodology a comparison of demand projections from the 2007 WRDMP and this update can be a useful exercise in validating the projections presented in this update. For comparison purposes, **Table 4-16** provides demand data for the 2007 WRDMP and EDCWA's Baseline and Target 20x2020 update developed for this report. **Figure 4-9** shows the same information in graphical format for ease of comparison. Note the GDPUD 2010 UWMP does not include a buildout projection, so a comparison is not possible using that source.

Table 4-16 Georgetown Divide Public Utility District Demand Projection Comparison

	EDCWA 2007 WRDMP	*EDCWA 20x2020 Baseline*	*EDCWA 20x2020 Target*
Service Area	11,495	9,274	7,542
Favorable Areas	1,318	1,358	1,086
FAR GP Amendment	1,009	1,192	953
Subtotal Urban Demand	*12,504*	*11,824*	*9581*
Agriculture	16,911	10,349	10,349
Total	***30,733***	***22,173***	***19,930***

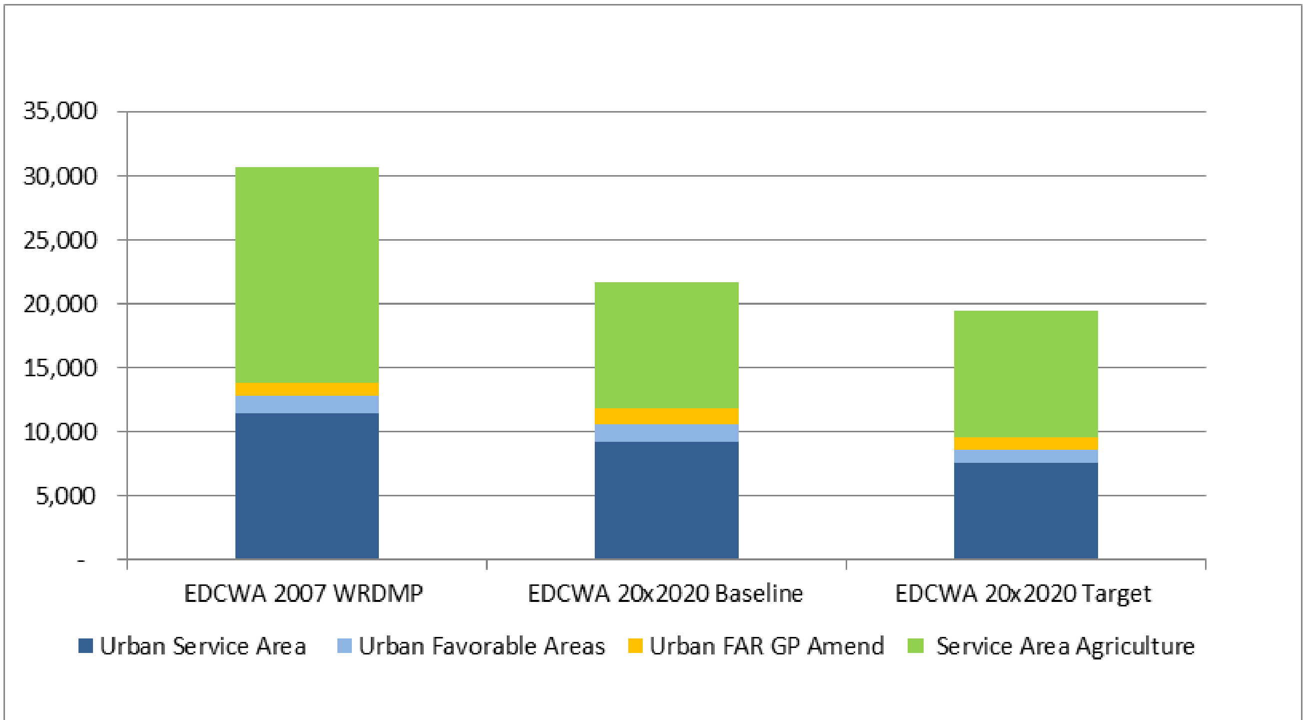

Figure 4-9 Georgetown Divide Public Utility District Demand Comparison (acre-feet)

GDPUD Urban Demand Comparison

Using per capita water demand factors to project long term water demand is a departure from the traditional approach, used by EDCWA, of applying separate household and employee unit use factors or water duties to various land uses projected over time. As noted above, there are weaknesses inherent in the per capita methodology. In the GDPUD case, changes in relative residential and commercial land uses are not captured because per capita demand, as developed for the UWMP, is based on an historic land use mix and not a future land use mix that may look very different over time.

In Table 4-11, an adjusted per capita use factor was developed to compensate for this shortcoming. To validate the accuracy of the adjustment factor, a comparison was made of the urban water demand projections from the 2007 WRDMP (based demand on household and employment projections) and the estimates for GDPUD developed for this analysis (based on population estimates and the adjusted Baseline GPCD demand factors). As ultimate buildout within the GDPUD

Service Area is based on achieving the land use densities permitted in the 2004 General Plan, demand projections for buildout conditions should be comparable (at buildout conditions are the same for each projection).

Since the 2007 WRDMP based water demand on historical use, a comparison to the water demand derived for the baseline 20x2020 demand factor (also based on a historic average) should be comparable since they are derived from the same baseline source data on historical water demand. As shown in Table 4-14, however, the Baseline 20x2020 urban projection of 9,274 acre-feet is significantly lower than the 2007 WRDMP projection of 11,495 acre-feet. Assumptions related to latent demand are partially responsible for the significant difference in the projections. Latent demand of 15% was used for the 2007 WRDMP compared to 5% used for this update. Also, a portion of the latent demand attributed to agricultural demands in the 2007 WRDMP were incorrectly assigned to urban uses. When considering the combination of these two changes/corrections (approximately 2,400 acre-feet), the projections are only slightly different, thus validating the methodology.

■ **GDPUD Agricultural Demand Comparison**

Table 4-15 shows differences in agricultural demand projections that are primarily due to land area considered. For the 2007 WRDMP, land use capacity of Choice Farmlands inside and outside Agricultural Districts is the basis. For this update only lands within Agricultural Districts were considered.

4.4 GRIZZLY FLATS COMMUNITY SERVICES DISTRICT

4.4.1 GFCSD Urban Demand Projection

For this analysis, the 2004 General Plan Housing Forecast was not used, because household projections are only available for the entire TAZ, which is inclusive of the GFCSD boundary. As the TAZ is substantially larger than the GFCSD Service Area, the estimate of housing units provided in the GFCSD 2012 Water Supply and Development Update (WSDU) are incorporated herein.

GFCSD is not an Urban Retail Water Supplier and is not subject to the SB x7-7 requirements, so household unit demand of 0.25 acre-feet/household (for 2010) identified in the 2012 WSDU is used in this analysis. The unit demand factor includes 10% unaccounted for water. There is essentially no commercial demand or agricultural demands within the GFCSD Service Area. **Table 4-17** presents total projected GFCSD households and calculated water demand from the 2012 WSDU.

Table 4-17 Grizzly Flats Community Service District Urban Buildout Demand Projections

Households[a]	*Unit Demand*[a,b] *(acre-feet/hh)*	*Demand (acre-feet)*
1,252	0.25	313

a. Households and unit demand factor from 2012 Water Supply.
b. Unit demand factor includes 10% unaccounted for water.

Table 4-18 provides demand projections for 2030 and buildout, based on the projected long term West Slope growth rate of 1.03% from the TGP Update as discussed in Section 3.1.2.

Table 4-18 Grizzly Flats Community Services District Demand Projection

	Urban Demand		
	2010	***2030***	***Buildout***
Service Area	153	187	313

4.5 OTHER COUNTY AREAS

4.5.1 Urban Water Demand

For Other County Areas (OCA) outside the purveyor boundaries, the 2004 General Plan housing forecast and unit household water use factors were used to determine potential water demand. **Table 4-19** presents the total OCA households, households reallocated to EID and GDPUD from Table 3-4, and the remaining OCA households.

Table 4-19 Households Remaining in Other County Areas

Total OCA Households[a]	***Households Reallocated to EID***	***Households Reallocated to GDPUD***	***Households Remaining in the OCA***
31,640	13,152	1,746	16,742

a. Total buildout households from GP Housing Forecast included in Appendix B.

Within OCA there are no urban retail water agencies providing water service, and as a result SB X7-7 requirements do not apply. Household unit demand for OCA used in the 2007 WRDMP is 0.7 acre-feet/household. In **Table 4-20** this unit demand factor is applied to the households not reallocated to the EID and GDPUD Service Areas to calculate residential demand in OCA.

Table 4-20 Other County Areas Urban Buildout Demand Projection

Households Remaining in the OCA	***Unit Demand[a] (acre-feet/hh)***	***Household Demand (acre-feet)***	***Total Demand[b,c] (acre-feet)***
16,742	0.7	11,719	12,336

a. Unit demand factor used in 2004 General Plan/2007 WRDMP for OCA.
b. Includes latent demand of 5%.
c. Assumes all 2004 General Plan/2007 WRDMP projected commercial demand (578 acre-feet) is reallocated to EID and GDPUD.

4.5.2 Agricultural Demand

Existing agricultural land uses in OCA are supported by private wells drilled in fractured rock. The wells are generally low producing and not capable of supporting large water intensive agricultural operations. While there are some deciduous orchard crops grown in the OCAs, most cultivation is wine grapes that have a relatively low water duty. Expansion of agricultural land use in OCA on the scale represented in Table 4-20 is likely not possible without the introduction of a public surface water supply. The projections developed for this analysis assume that water would largely be conveyed through newly developed infrastructure to supply water to the land outside the EID and GDPUD Service Areas. The cultivated acreage in **Table 4-21** is from Table 3-6 and assumes a crop mix similar to the base year of approximately 20% Deciduous Orchard category and 80% Vineyard, Christmas Trees, Olive/Citrus, Berries category with no increase in the Pasture and Other category.

Table 4-21 Other County Areas Agricultural Buildout Demand Projection

	Area (acre)	*Crop Water Use[a,b] (acre-feet)*
Deciduous Orchards	2,178	6,098
Vineyard, Christmas Trees, Olive/Citrus Berries	8,711	11,325
Pasture and Other[c]	14	53
Total	***10,903***	***17,476***

a. Based on water duty of 1.3 acre-feet/acre for vineyards, Christmas trees, olive/citrus, berries and 2.8 acre-feet/acre for deciduous orchards.
b. Does not include conveyance system losses.
c. Assumes no net increase in this land use category.

4.5.3 Demand Projection Summary

Table 4-22 provides the combined urban and agricultural OCA demand projection at buildout. A 2012 estimate and 2030 projection are not made for OCA.

Table 4-22 Other County Area Demand Projection (acre-feet)

	Build-Out Demand
Urban	12,336
Agriculture	17,476
Total	***29,812***

Chapter 5. Water Use Efficiency

Water reuse, recycling, and conservation are increasingly important components of the state's overall water supply. These measures are a growing part of El Dorado County plans for providing reliable supplies for multiple benefits into the future. This chapter presents an update to the Water Efficiency Chapter of the 2007 WRDMP, describing: 1) West Slope urban retail water suppliers' past water conservation achievements; 2) water use efficiency strategies to optimize supply and meet the state mandated SB X7-7 conservation goals; and 3) potential new conservation and water use efficiency strategies that could reduce demand estimated in Chapter 4 beyond the SB X7-7 conservation goal.

5.1 WATER CONSERVATION AND OPERATIONAL STRATEGIES FOR WATER SUPPLY OPTIMIZATION

Water conservation has been and remains an important component of water resources management in the County. Although it is the area of origin for a significant volume of water used in the greater Sacramento region, El Dorado County itself has limited developed water supplies. As a result, conservation efforts (including metering) have been a high priority since the 1976-77 drought and remain an important component of water resource management in the County. Water conservation broadly defined, is the use of available raw and treated water resources in increasingly efficient ways in order to serve as many beneficial uses as possible. Many areas have been metered since the 1970s and water service in the County is metered today with very few exceptions. Irrigation management services (IMS) have been offered by EID since the early 1980s; the program has substantially reduced agricultural water use and is responsible for saving over 2,000 acre-feet of water each year. EDCWA has been providing IMS for the remainder of the West Slope of the County since 2001, with water savings between 6% and 38% depending on whether ground water or surface water is used. This section describes in more detail the various state/local policies and the water conservation programs being implemented by El Dorado County West Slope water purveyors and EDCWA.

Water conservation and efficient use are common goals and objectives shared by local/regional water purveyors and state agencies to accommodate planned growth and address drought contingencies. The State Department of Water Resources requires that each water provider prepare an Urban Water Management Plan (UWMP) that describes programs and policies that ensure a reliable water supply for their service area for the future. UWMPs must be updated every five years, with the next UWMPs due by the end of 2015 (although this deadline may be extended by a year or so). As defined by California Water Code Section 10631, an urban water supplier is a provider that is either private or publicly-owned that serves at least 3,000 customers or supplies more than 3,000 acre-feet of water annually on a wholesale or retail basis. Urban water management programs typically contain the following five elements: 1) water delivery and per capita water use data; 2) description of the water supply, water supply reliability, and water demand management measures; 3) water shortage contingency plans; 4) water recycling; and 5) water service reliability. UWMPs typically include measures to improve operations and water use efficiency that will achieve the agencies' conservation goals.

EID and GDPUD are the urban water purveyors on the West Slope of El Dorado County that are required to develop UWMPs. EID and GDPUD have adopted a number of urban and agricultural programs to conserve water. Each purveyor implements different water conservation programs to meet the needs of their respective service area customers. Details of measures being implemented by these water suppliers in El Dorado County are described for each supplier in the following sections. The range of actions that have been taken varies with each water supplier, but generally includes the following:

- Reducing leakage and losses in raw water canals and conveyance systems
- Conducting water audits/surveys to assess potential illegal diversions/use
- Water and wastewater treatment plant backwash water recovery
- Leak management on both raw water and finished water distribution system
- Public education/outreach program implementation
- Tiered water rate structure implementation
- Residential and commercial/industrial (CII) plumbing retrofit program
- Rebate programs for high-efficiency clothes washers and toilets
- Rebate program for irrigation efficiency improvements
- Residential and CII water surveys and leak detection programs
- Individually metered landscape water use and sub-metering
- Implementing automated meter reading retrofits
- Tailwater controls and spill management

5.1.1 California Water Policy

In response to changing conditions and the costs associated with developing new sources of water supply, State water policy has become increasingly assertive in encouraging water use efficiency over the last decade. SB X7-7, the Water Conservation Act of 2009, set an overall requirement of reducing per capita urban water use by 20% by December 31, 2020 (with an interim goal of at least 10% by December 31, 2015) using one of the following methodologies.

1. 80% of baseline use
2. Sum of specified performance standards
3. 95% of DWR Hydrologic Region target from the draft 20X2020 Plan
4. A flexible alternative designed to adjust to local circumstances

As urban retail water suppliers, EID and GDPUD are subject to this legislation. Each has determined its “baseline” per capita water use (for residential, commercial and industrial uses) based on average demand for a recent 10 year period, expressed in GPCD. Their respective 2010 UWMPs also contain water reduction targets and water use reduction plans to demonstrate how they will achieve the per capita water demand target.

EID is expected to continue its conservation programs and expects to reduce per capita water consumption by 56 GPCD by 2020. Similarly, GDPUD is expected to reduce demand by 30 GPCD. The EID GPCD reduction is based on Method 1 and the GDPUD reduction is based on Method 3.

It should be noted that, with very limited exception, the 20x2020 legislation does not allow credit for reduced raw water losses in the calculation of target GPCD. Raw water losses for GDPUD represent the best opportunity for significant reduction system losses.

5.1.2 Factors Influencing Local Water Efficiency Programs and Cost Effectiveness

El Dorado County has unique opportunities to achieve water use efficiency. A significant amount of potable water is used to meet agricultural water demands due to the lack of groundwater availability in the fertile mountainous areas. Irrigation demands are higher than the more populated coastal regions of the state. As presented in **Figure 5-1**, most of the developed areas on the western slope of El Dorado County are in Climate Zones 13 and 14. Evapotranspiration rates on the West Slope are more than 40% higher, on average, than coastal regions such as San Francisco. As a result, the County has a strong emphasis on agricultural water efficiency and urban outdoor landscape water efficiency. In addition, in the western downslope section of the county, urban landscapes are served by metered recycled water instead of surface water to meet outdoor irrigation demands.

BMP implementation has historically been driven by local cost effectiveness and the availability of grant funds that make implementation cost effective. Cost effectiveness has been measured using industry standards like the American Water Works Association, Manual of Practice, M52, Water Conservation Program – A Planning Manual:

> *Water conservation planners often rely mostly on cost-effectiveness analysis to compare water conservation measures. This type of analysis is a systematic way to evaluate benefits and costs associated with measure implementation. A conservation measure is said to be cost-effective if the present value of the benefits [avoided cost of supply] exceeds the present value of the costs [to implement the conservation program]. (AWWA, 2006)*

Local costs of existing water supplies in El Dorado County are low when compared with other parts of California, since much of the source of supply is gravity feed which does not require costly pumping and requires less costly treatment due to more pristine water quality in the Sierra foothills. Consequently the avoided cost (or benefits) of saving water is significantly lower than in coastal regions of the state reliant on imported supplies. As El Dorado County looks to new supplies to meet its long term water needs, the cost of such supplies are expected to affect the cost effectiveness of a number of conservation measures. Fortunately there are a number of potential future water use efficiency measures that are possible. For example, recycled water use could be expanded. Further reductions in urban landscape use could be developed through various incentives and new technology.

The following sections address existing and continuing water conservation programs. Section 5.7 addresses the relative cost effectiveness of specific water use efficiency measures currently implemented or having future potential.

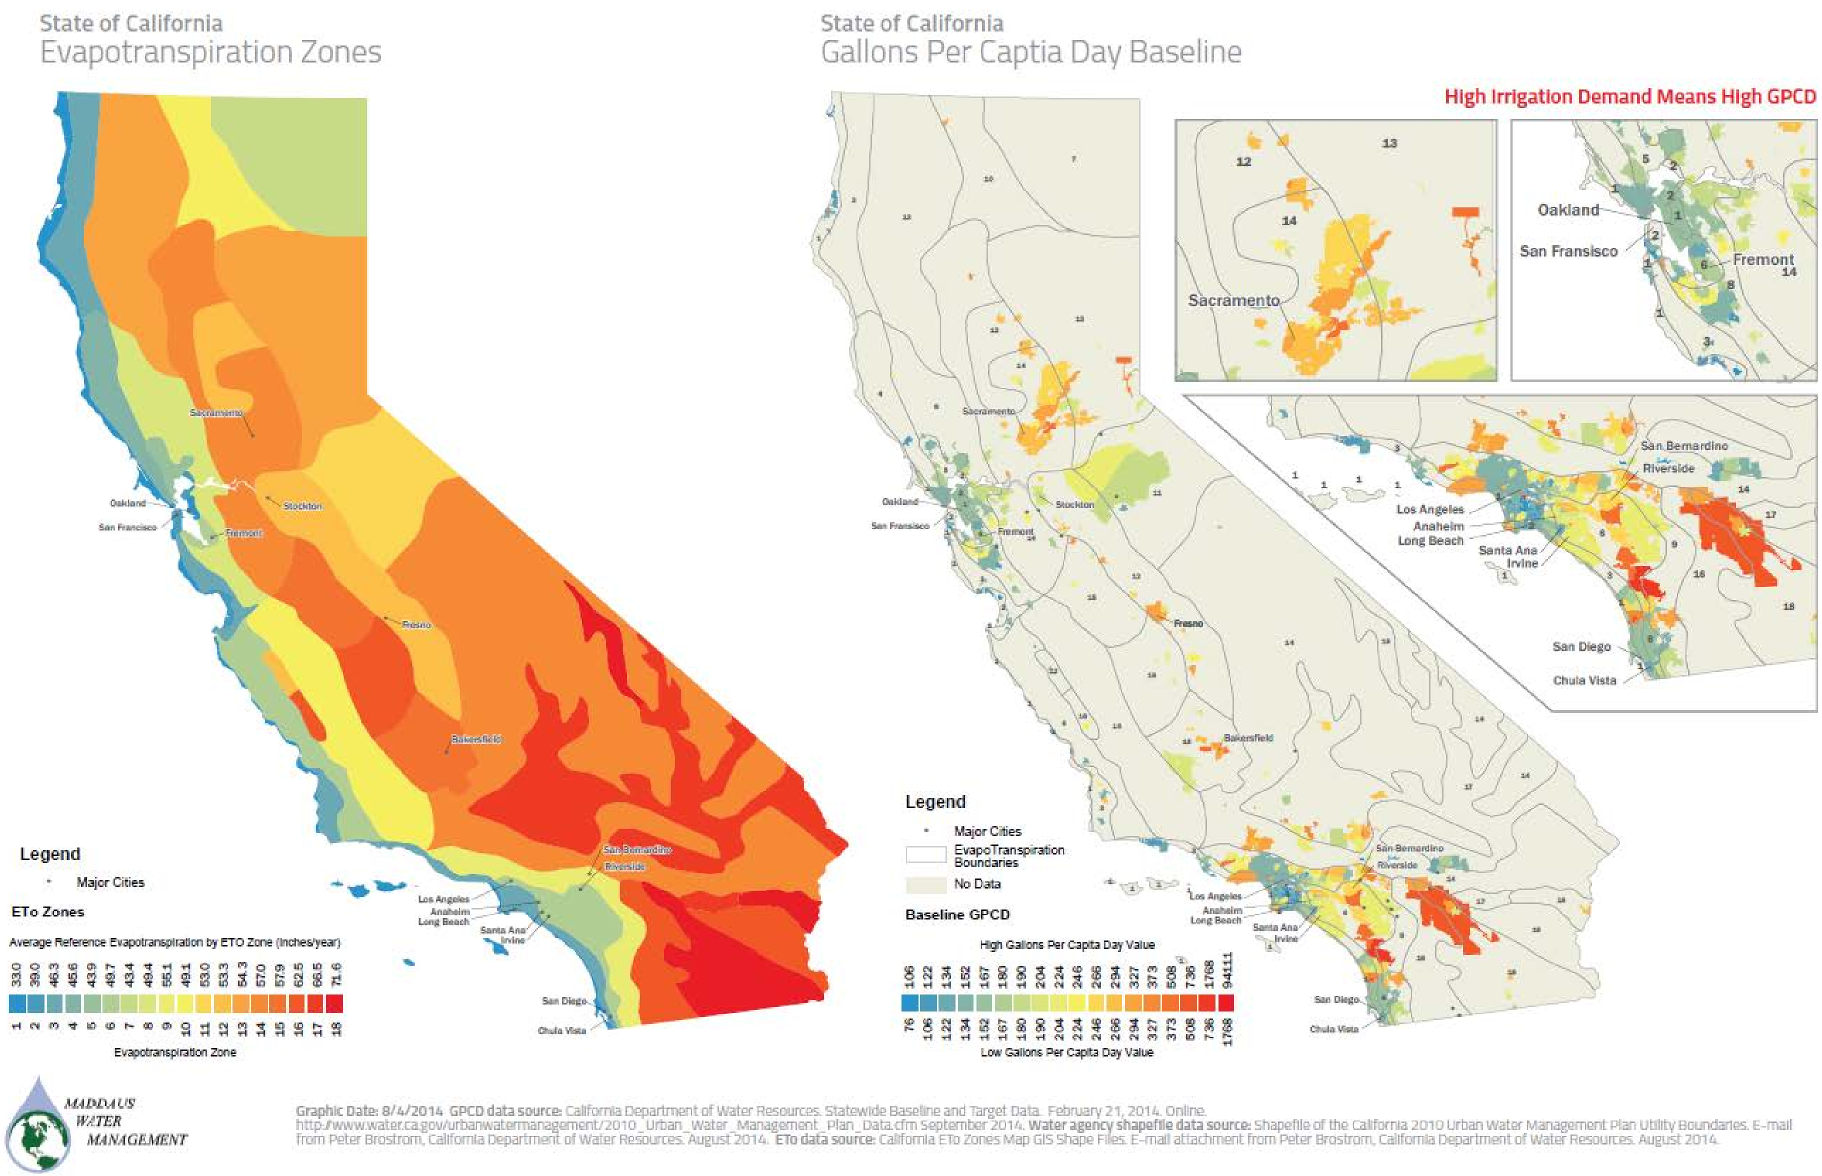

Figure 5-1 Climate Zones

5.2 EL DORADO IRRIGATION DISTRICT

EID has a long history as a leader in the region for progressive urban and agricultural water efficiency programs, and a statewide leader for the development of a recycled water program for front and backyard residential irrigation.

5.2.1 California Urban Water Conservation Council

The Council is a voluntary consensus-based organization created to promote efficient water use statewide through partnerships among urban water suppliers, public advocacy organizations, and other interested groups. The Council's goal is to integrate urban water conservation Best Management Practices (BMPs) into the planning and management of California's water resources through voluntary partnerships.

Members of the Council commit to developing and implementing Foundational and Programmatic BMPs for water conservation. The Foundational BMPs (Utility Operations and Education programs) consisting of operations practices (conservation coordinator and water waste prevention), water loss control, metering, conservation pricing, public information and school education programs. The Programmatic BMPs (residential, commercial, industrial, institutional and landscape categories) consist of water surveys, leak detection assistance, plumbing retrofits, incentives for high-efficiency clothes washers and toilets, and incentives to improve water efficiency through water budgets, and site specific technical assistance to sites over budget.

The initial California Urban Water Conservation Memorandum of Understanding (MOU) was signed by nearly 100 urban water agencies and environmental groups in December 1991. Since then the Council has grown to 400 members. Those signing the MOU have pledged to develop and implement urban water conservation practices to reduce the demand on urban water supplies. EID has been a member of the Council since 2003. As a Federal water supply contractor, EID annually reports its BMP activity to the Council. The Council issues bi-annual coverage reports for all members.

5.2.2 Best Management Practices (BMPs)

EID implements the Council's BMPs in all of its customer sectors for: (1) residential, (2) commercial, Industrial, and institutional (CII) and (3) agriculture. All existing and new water services within EID are metered and billed by volume-of-use and a tiered rate structure. EID has identified landscape irrigation as having the highest potential for water savings, and has focused significant resources in this area including water surveys and irrigation efficiency rebates. Indoor water efficiency has included rebates and complimentary plumbing retrofits as summarized below. Over $1.4 million in grant and EID funds have been invested in urban and agricultural water efficiency programs over the last decade. Areas of investment Include but are not limited to the following:

- **Urban BMP Investment**
  - Incentives for CII customers with mixed-use meters to install dedicated irrigation sub-meters
  - Rebate incentive program for large landscape irrigation systems
  - Rebates for smart controllers for residential and CII customers

- Water surveys and leak detection assistance for residential and CII customers
- Incentives for CII customers including waterless urinals and pre-rinse spray valves for commercial dishwashers.
- Rebates for high-efficiency clothes washers
- Rebates to replace high flush volume toilets with Ultra Low Flow and High Efficiency toilets (since 2009)
- Public information about water efficiency programs highlighted in EID's bi-monthly newsletter
- School education programs that promote water efficiency for grades K through 12.
- Partnerships with water agencies in the Sacramento area through membership in the Regional Water Authority's Water Efficiency Program (WEP)

Agricultural BMP Investment

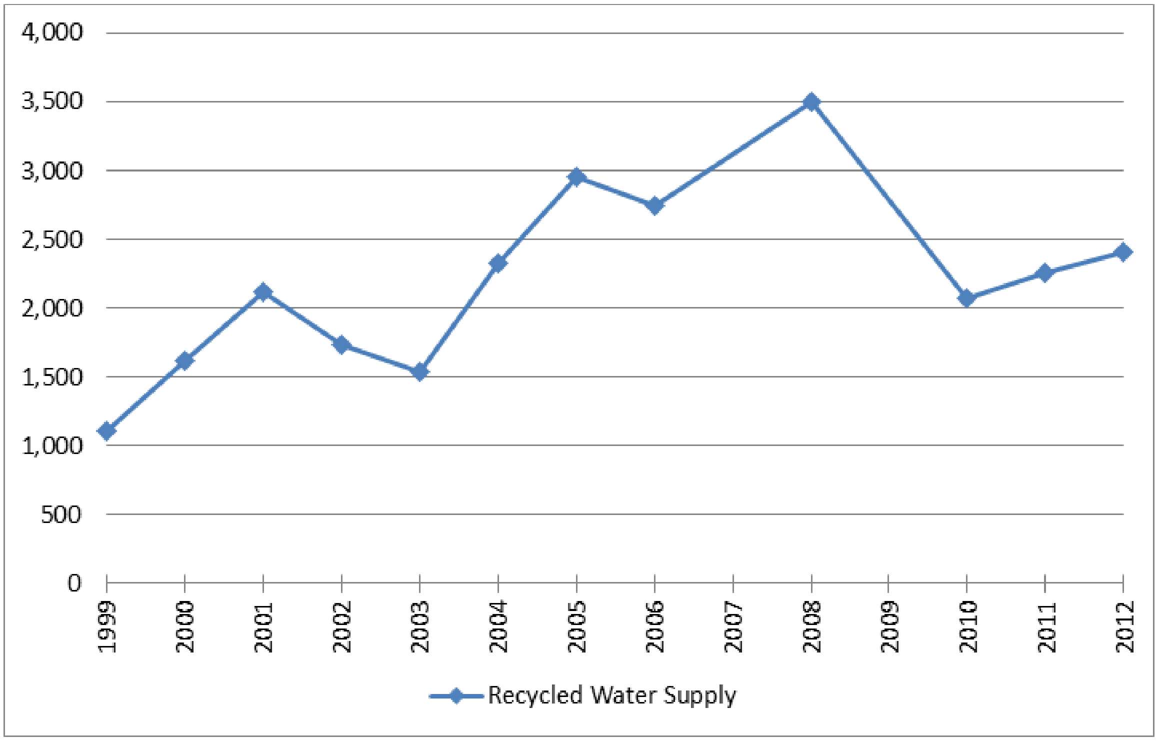
EID has implemented an Irrigation Management Services (IMS) Program since the late 1970s. This very successful program monitors soil conditions and provides irrigation recommendations to growers with five or more acres in production. EID currently monitors the soil moisture conditions at approximately 232 field sites that are read weekly during the irrigation season. Each grower receives individualized farm data the following day. The data indicates soil moisture status, predicts the next scheduled irrigation, and recommends the amount of water to apply to each field. The program also provides weather data from the California Irrigation Management Information Service (CIMIS) station #13 located in EID's service area near the community of Camino. The water savings realized by growers who participate in the IMS program has equaled more than 2000 acre-feet every year since inception. Irrigation efficiency has risen from less than 50 percent to nearly 80 percent for farms in the program from 1977 to today. Approximately 30% of growers within the EID service area participate in the program.

Recycled Water

EID has made a priority of using treated wastewater to meet non-potable needs within its service area beginning in 1979. In 1990, EID began tertiary treatment and reclamation for golf courses and road median irrigation. Over the next 10 years EID constructed transmission and distribution systems to serve local growth. EID has developed award-winning recycled water infrastructure that utilizes tertiary treated wastewater for public landscaping and residential irrigation demands. The Serrano master-planned community uses recycled water for its golf course and residential and public landscaping. The Town Center, Creekside Greens, Euer Ranch and West Valley developments also use recycled water for residential, park and/or street median landscape irrigation. Currently EID provides service to 4,600 residential and 170 commercial customers and all services are metered (EID 2013). Other future developments are also planned for use of recycled water. EID mandates use of recycled water through Board Policy 7010, wherever economically and physically feasible (EID 2010 UWMP).

EID’s ability to expand its use of recycled water is limited by wastewater inflow to the WWTPs and limited storage at the El Dorado Hills WWTP. In order to meet the current recycled water demand, EID supplements its recycled water supply with potable water at recycled water tanks. Recycled water supply shown in **Figure 5-2** varies year to year based on plant influent and recycled water demand and has been as high as 3,400 acre-feet (2008). EID delivered a total of 2,400 acre-feet of recycled water in 2012 representing approximately 7% of total raw water diversions. An additional

600 acre-feet of potable water was used to supplement the recycled water system. As WWTP inflows increase with growth, up to 5,600 acre-feet of recycled water is projected to be available. Optimization of recycled water production with seasonal storage is discussed in Section 6.6.



SOURCE: EID (2000-2013) Water Resources and Service Reliability Report

Figure 5-2 EID Historical Recycled Water Supply (acre-feet)

5.2.3 Historical Active Water Conservation Savings

EDCWA commissioned Brown and Caldwell to prepare a Water Use and Conservation Analysis (WUCA) in early 2010 in response to its concerns over the availability of regional water supplies and its ongoing water supply acquisition projects. The report presents an analysis of historic and current local water use, estimates urban GPCD baselines, and documents conservation activity for EID, including the City of Placerville, GDPUD, and STPUD. The report also includes purveyor historic average per capita water use and conservation savings compared to statewide, regional, and local water system estimates. Information in this section primarily comes from the 2010 WUCA and is supplemented with information from the EID 2010 UWMP.

EID provides wholesale water to the City of Placerville and the City contracts with EID to provide conservation services. EID's service area surrounds the City of Placerville, and EID tracks water savings for its own customers as well as savings for Placerville customers; therefore, historical and projected conservation savings and water use are presented jointly for the two water purveyors.

In quantifying water conservation achieved by EID the 2010 WUCA indicates that:

> *EID and Placerville saved approximately 9,300 AF of water through metering (formerly BMP 4). Both agencies have potable water systems that are fully metered, and both employ tiered*

rate structures. Water savings resulting from metering is based on an estimated 20 percent reduction in water use according to the CUWCC. Approximately 3,600 AF in additional savings, resulting from other BMP implementation, was realized in 2008. Recycled water production at EID's Deer Creek and El Dorado Hills Wastewater Treatment Plants offset potable water use by approximately 3,500 AF in 2008.

Figure 5-3 presents EID and Placerville's historical urban and agricultural water use and conservation savings resulting from metering and other BMP implementation from the 2010 WUCA. The blue shaded area is actual water diverted to meet demands. The purple shaded area is actual recycled water supplied. The orange shaded area is water that would have otherwise been diverted if not for implementation of water conservation measures.

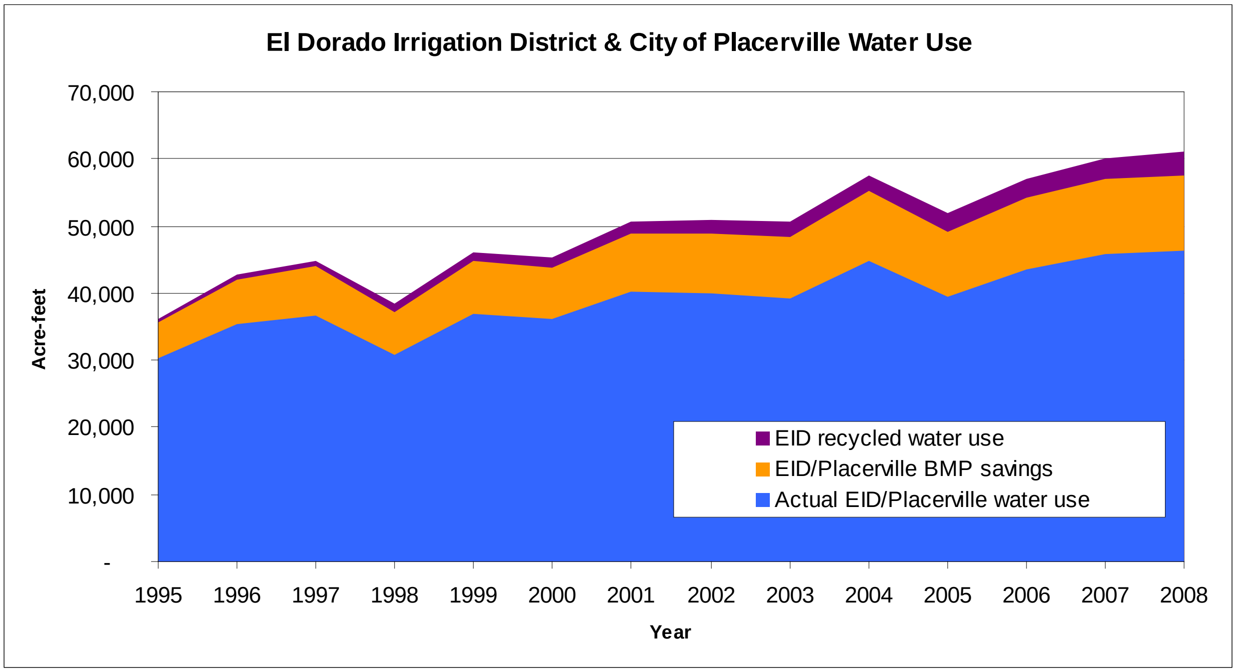


Figure 5-3 EID and Placerville Historical Water Use and Estimated Active Water Conservation Savings

Source: EDCWA 2010 Water Use and Conservation Analysis

The EID 2010 UWMP reports water savings to be about 4,000 ac-ft to date per year, based on BMP reports submitted to CUWCC website since 2002, which represented 11% of 2010 diversions of 35,677 acre-feet. Water conservation resulting from metering is not reflected in the reporting because meters were installed in the 1980's, prior to creation of CUWCC.

5.2.4 Achieving 20x2020 Conservation Goal

The following is a summary of EID water efficiency initiatives and programs (also available to City of Placerville water service customers). These actions are characterized as active conservation because EID has direct control over operational improvements and some control for offering opportunities for engaging customer participation for achieving 20x2020 goals. The BMPs and capital improvements listed below -- together with the passive water savings from building codes, landscape requirements and retrofits subject to plumbing and appliance standards -- represent EID's current plan for meeting the 20 percent water conservation requirements under current law:

Residential Indoor

- Toilet rebates: for the installation of new high-efficiency, WaterSense rated toilets in pre-1992 residences.
- Clothes washer rebates: for new TIER 2 and TIER 3 models.
- Irrigation efficiency rebates: including the addition of weather, soil moisture, or rain sensors; replacing existing controllers with WaterSense certified models; converting fixed spray heads with high-efficiency nozzles or drip irrigation systems; and replacing leaking control valves.
- Home water audits: including leak detection assistance at the water meter and complimentary plumbing retrofits as needed.
- Complimentary plumbing retrofits: including WaterSense rated showerheads and faucet aerators, toilet tank displacement bags, toilet leak detection packets, and toilet flappers if a leak is detected.

Commercial/Industrial/Institutional (CII)

- Toilet rebates: for new high-efficiency, WaterSense rated toilets or urinals in pre-1992 establishments.
- Clothes washer rebates: for new TIER 2 and TIER 3 models.
- Water surveys: to assist in identifying leaks, fine tuning irrigation schedules, and offering water-efficiency recommendations.
- Pre-rinse spray nozzles: complimentary low-flow, high-efficiency and high-velocity pre-rinse spray valves to replace older 2 to 6 gallon per minute spray valves.

Agriculture

- Irrigation Management Services program: The program serves 70 growers and 232 soil moisture monitoring sites on approximately 350 acres with an annual budget of $20,000.
- Maintain the State CIMIS station #13 at Camino.

Large Landscape Dedicated Meters

- Irrigation efficiency rebates: including the addition of weather, soil moisture, or rain sensors; replacing existing controllers with WaterSense certified models; converting fixed spray heads with high-efficiency nozzles or drip irrigation systems; and replacing leaking control valves.
- Water budgets: provides web-based budgets calculated using aerial maps of specific sites through an RWA contract with Waterfluence.
- Low cost sub-metering: available to CII customers only, excluding Placerville customers, to separate landscape irrigation from building uses for more efficient monitoring of irrigation demands.

Educational

- Water Education Materials: available to all local schools within the EID service area and the City of Placerville. The complimentary materials include interactive classroom booklets (K-8) concerning water conservation, the water cycle, and water-themed coloring books.
- Media Education Program: provides electronic newspapers, educational supplements, and teacher guides to classrooms.
- Landscape publications: available in the lobby of EID's headquarters building and at local events, including materials on water-efficient landscape design and plant selection. The popular, interactive "Water-Wise Gardening in the Gold Country Region" plant database software is also available at the lobby kiosk or at EID's website.

- Demonstration garden: The EID headquarters building features a drought-tolerant garden with several native plant species. Signage identifies the plants, and corresponds with a list of the common and botanical names of the garden's plants available in the lobby. A detailed plant report is also available upon request at the front desk or at the lobby kiosk.
- Events: complimentary water-efficiency publications and materials are available from EID for distribution at local community events.

Recycled Water

- EID operates two reclamation plants and delivers an average 3,000 acre-feet of recycled water each year to CII customers, residential dwellings for front and back yard irrigation and treatment plant uses. Recycled water use is mandatory, where feasible, within the service area and is metered and billed on a volumetric basis.

Water Supply Conveyance Capital Improvements

- Piping the Main Ditch between Forebay Reservoir and the Reservoir 1 Water Treatment Plant. This project will reduce seepage and evapotranspiration losses by an estimated 1,300 acre-feet per year.
- Waterline replacements

In addition to the water conservation elements above, EID implements the following "foundational BMPs".

- Volumetric metering of water system customers with tiered commodity rates, including meter testing and programmatic meter replacement.
- Enforcement of a water waste prohibition regulation all year and at all times, including yearly notifications in EID's newsletter.
- Water loss control including pressure management, leak detection and intervention.
- Wholesale agency water efficiency assistance to the City of Placerville customers.
- Designation of full-time water conservation coordinator.

Since the enactment of the first statewide plumbing code measures in 1978, passive savings have also been assumed to occur by actions of existing EID customers as a result of the federal, state and local codes. These codes have evolved over time as technology has become increasingly efficient. Each of the four items listed below, along with the year the standard became/becomes effective, are described in Section 6.5.

1. National Plumbing Code (1992)
2. Cal Green (2011),
3. AB 715 (2014)
4. SB 407 (2017)
5. AB 1881 (Model Water Efficient Landscape Ordinance, 2010)

5.3 GEORGETOWN DIVIDE PUBLIC UTILITY DISTRICT

GDPUD began installing meters in 1961. Since the 1976/77 drought GDPUD has been proactive in implementing water conservation measures. Since 1982, treated water has been billed on an inclining block rate structure where the unit cost increases with the amount of water used. This penalizes inefficient water use. Today almost all (99.8%) urban water connections are metered and billed by volume and a tiered rate structure. Water used by irrigation and agricultural accounts is also metered. Agricultural customers use untreated water, which is metered and billed on the basis of a specific flow rate.

5.3.1 Water Efficiency Program and Demand Management Measures

GDPUD focuses mainly on agricultural water efficiency programs including lining open canals and irrigation management, with $120,000 dedicated annually to lining and piping open canals. GDPUD's urban water efficiency program has focused on five main areas: pressure control; customer communication about abnormal water use; residential plumbing retrofits; large landscape efficiency and education/public outreach. GDPUD also enforces water waste prohibitions even during normal water supply situations. These ordinances prohibit gutter flooding, non-recirculating fountains, non-recirculation systems in carwash and commercial laundry establishments.

Agricultural Water Efficiency

GDPUD owns and operates over 75 miles of raw water conveyance system. The District estimates that operational and carriage losses in the raw water conveyance system account for up to 3,000 acre-feet of water per year, or approximately 25% of total diversions. As a result, raw water conveyance system losses have been identified as having the highest potential for further conservation. Routine funding for rehabilitation has resulted in piping or lining over 30 percent of the untreated water conveyance system. Unfortunately, the 20x2020 legislation does not allow credit for GDPUD's reduced raw water losses in the calculation of target GPCD.

Urban Demand Management Measures

While GDPUD focuses mainly on more significant water savings from agricultural water efficiency measures, GDPUD also implements the applicable Demand Management Measures (DMM) described in the Urban Water Management Planning Act (Water Code Section 10610 et seq.) to support its urban water efficiency program. According to its 2010 UWMP, GDPUD has implemented 11 of the 14 DMMs. As cited in the 2010 UWMP, GDPUD determined that 3 DMMs either do not apply to the District or are not currently economically feasible based on the cost of existing supplies. Additional analysis is required to determine the cost effectiveness of these measures when compared to the cost of future water supplies. **Table 5-1** provides the DMM description and status. GDPUD is not a member of CUWCC.

Table 5-1 2010 UWMP GDPUD DMM Implementation Status

DMM	*DMM Description*	*Implemented?*
A	Water Survey Programs for Single-Family and Multi -Family Residential Customers	Yes
B	Residential Plumbing Retrofits	Yes
C	System Audits, Leak Detection and Repair	Yes

D	Metering with Commodity Rates for All New Connections and Retrofit of Existing Connections	Yes
E	Large Landscape Conservation Programs and Incentives	Yes
F	High-Efficiency Washing Machine Rebate Programs	No(1)
G	Public Information Programs	Yes
H	School Education Programs	Yes
I	Conservation Programs for Commercial Industrial and Institutional Accounts	Yes
J	Wholesale Agency Assistance Programs	No(2)
K	Conservation Pricing	Yes
	Water Conservation Coordinator	Yes
M	Water Waste Prohibition	Yes
N	Residential Ultra-Low-Flush To let Replacement Programs	No(1)
(1) Implementation not economically feasible (2) Implementation not applicable to District		
Source: 2010 UWMP, Page 33		

GDPUD has determined that offering a high efficiency washer or ultra-low-flush toilet rebate program is not cost effective based on the current cost of service. While GDPUD offers some level of assistance to CII customers by making them aware of abnormal water use, offering incentives is also not cost effective at this time. Future analysis of cost effectiveness considering the cost of new supplies may change the outcome of this analysis. Alternatively, GDPUD focuses its resources on the larger conservation potential of broader system-wide water conservation measures such as ditch lining of the raw water delivery system.

Recycled Water

There is currently no recycled water use in the District service area. The District manages the onsite wastewater disposal system serving the Auburn Lake Trails Subdivision in Cool. This 1,100 lot subdivision utilizes site-specific waste disposal methods that depend on the type of soil present on each lot. A small Community Disposal System (CDS) serves 139 of these lots that otherwise do not support site-specific disposal. Average dry weather wastewater flow from this system has been 22,000 gallons/day. At build out, the CDS will handle approximately 32,000 gallons/day.

The District and the Auburn Lake Trails Owners Association has evaluated the potential for utilizing reclaimed water to irrigate the nearby 9-hole golf course. The golf course currently uses 100,000 gallons of treated water per day during the summer months. The district and property owner's association determined that the wastewater system could only meet approximately 30% of that demand. Since the wastewater is not disinfected and is classified as primary wastewater, additional treatment would be required. These factors make the use of recycled water cost-prohibitive at this time.

5.3.2 Historical Active Water Conservation Savings

The 2010 WUCA indicates:

> *In 2008, GDPUD saved approximately 430 AF of water through metering (formerly BMP 4). Savings are based on an estimated 20 percent reduction in water use according the CUWCC.*

From the 2010 WUCA, **Figure 5-4** presents GDPUD's historical urban water use and conservation savings resulting from metering only as savings associated with other DMMs is not available.

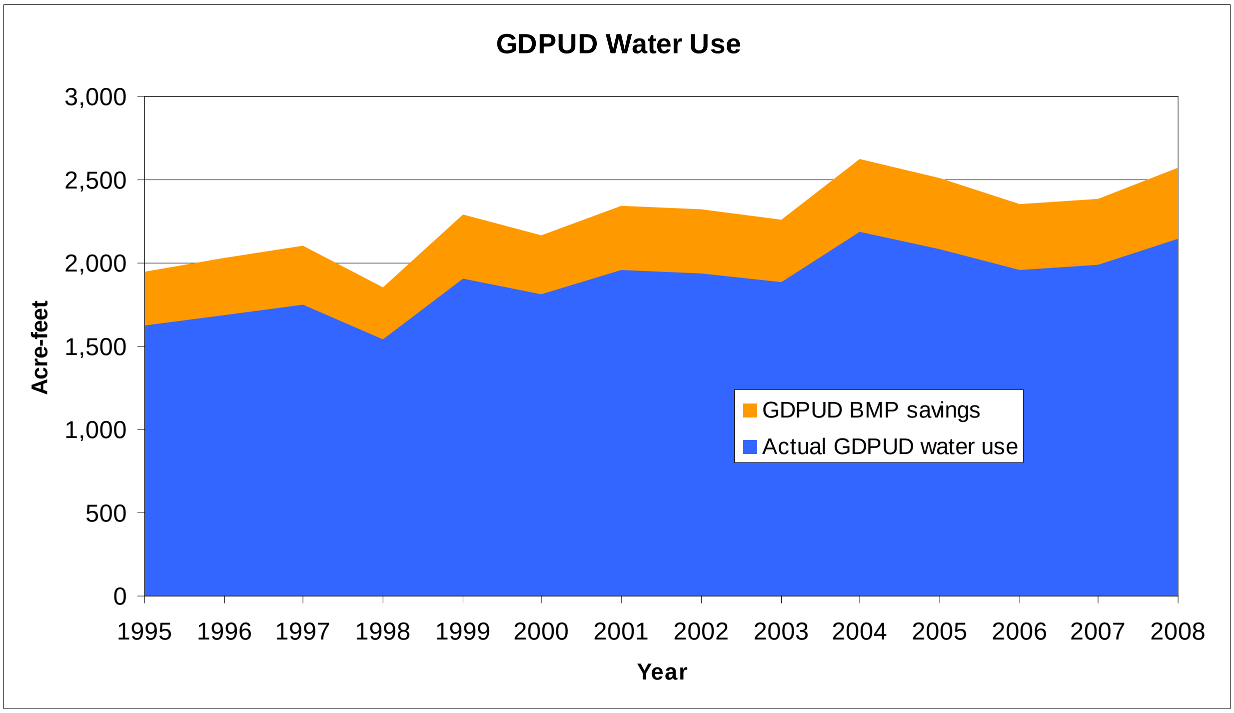

Figure 5-4 GDPUD Historical Urban Water Use and Estimated Active Water Conservation Savings

SOURCE: EDCWA 2010 Water Use and Conservation Analysis

GDPUD's 2013 water rights report to the State Water Resources Control Board indicates the District achieved a combined total of 5,200 acre-feet of water conservation savings in its raw and treated water systems. The savings is attributed to metering, public education, inclining block rate structure for the treated water system, loss monitoring, crop acreage records, canal piping and lining, phreatophyte removal and irrigation efficiency programs. A breakdown of the savings between urban and agricultural uses was not provided.

5.3.3 Achieving Per Capita Conservation Goal

The following is a summary of GDPUD water efficiency initiatives and programs from its 2010 UWMP. These actions are characterized as active conservation because the agency has more direct control over implementation of operations related measures and resources to engage and encourage customers to participate in efficiency programs. The scope of the following DMMs and capital improvements together with the passive saving that will result from building and plumbing code changes represent GDPUD current plan for meeting its SB X7-7 urban water conservation requirements.

Agricultural Water Efficiency

- Metering: Untreated irrigation water is contracted and billed on the basis of a specified flow rate. Deliveries from ditches are metered. Deliveries from pipelines are made through pressure-activated flow metering devices.
- Weather Monitoring: To promote water conservation through efficient application of irrigation water, two evaporation/weather stations have been established with the support and

cooperation of the Department of Water Resources and Georgetown Divide Resource Conservation District. Station data is published in local newspapers weekly during the irrigation season.

- Education: The Conservation District has sponsored demonstrations and newspaper articles concerning development of effective irrigation schedules by using weather and soils data.
- Irrigation Management Services (IMS): The El Dorado County Water Agency sponsors an IMS program available to growers within the GDPUD service area, utilizes irrigation management consultants, that includes providing growers with weekly site specific soil moisture monitoring results from moisture sensing nuclear probes and recommended irrigation scheduling by crop. District staff is also trained to assist in defining soil type, water holding capacity, and efficient irrigation scheduling for customers.

Urban Demand Management Measures

- Residential Water Survey Program (DMM A): The program includes monitoring usage, customer notification of abnormal use, and incentives for timely repairs.
- Residential Plumbing Retrofits (DMM B): Water conservation kits including high quality 2.5 gpm or less showerheads, 2.2 gpm or less faucet aerators, toilet displacement devises and leak detection tablets. Kits are available at the District office and are offered during surveys.
- Water System Audits, Leak Detection and Repair (DMM C): Maintenance of Water Use Records by User Type. Monthly and annual audits that identify metered use by customer category, unmetered water for authorized and unauthorized uses. Immediate repair of reported leaks, remote sensing for leak detection, targeted pipeline replacement in areas of reoccurring leaks, aging meter replacements and pressure control are implemented.
- Metering with Commodity Rates (DMM D): 99.8% of the District's domestic water connections are metered and all water is billed volumetrically. 15 unmetered accounts will have meters by 2020 where practical and/or feasible.
- Large Landscape Conservation Programs and Incentives (DMM E): Dedicated irrigation meters and detailed water use information provided to customer. Assist customers in identifying conservation that will improve efficiency and provide economic incentive through rate structure.
- Public Information Programs (DMM G): Public information program promoting conscientious use of water resources including District personnel speaking at service clubs, neighborhood association meetings, conservation messaging in bimonthly bills, flyers available at district office and on website and a demonstration of drought tolerant plants at the district office.
- School Education Programs (DMM H): Education program including District personnel speaking at schools to promote conscientious water use, conducting field trips at water treatment plant and assisting with special projects involving water resources.
- Conservation Pricing (DMM K): Water billed on an inclining block rate structure where unit cost increases with the amount used, which penalizes inefficient water usage.
- Conservation Coordinator (DMM L): Staff member dedicated to the coordination and oversight of conservation efforts.

- Water Waste Prohibition (DMM M): 1982 ordinance authorizing abatement procedures to curtail blatant water waste including discontinuation of water service.

Capital Improvements

GDPUD plans to continue systematic lining and piping of its raw water conveyance system. The District aggressively pursues grant or loan funding whenever possible to maximize its ability to maintain, rehabilitate or upgrade the raw water conveyance system.

GDPUD plans to improve its urban and agricultural water conservation program with grant funding potentially available through the Cosumnes, American, Bear and Yuba (CABY) Integrated Regional Water Management watershed group. GDPUD recently applied for grant funding through Reclamation's WaterSmart program for raw water conveyance system improvements, which was unsuccessful, and has just been awarded CABY grant funding under DWR for the same project.

Since the enactment of the first state-wide plumbing code measures in 1978, passive savings have been assumed to occur by actions of existing GDPUD customers as a result of the federal, state and local codes. These codes have evolved over time as technology has become increasingly efficient. Each of the four items listed below along with the year the standard became/becomes effective is described in Section 6.5.

1. National Plumbing Code (1992)
2. Cal Green (2011),
3. AB 715 (2014)
4. SB 407 (2017)
5. AB 1881 (Model Water Efficient Landscape Ordinance, 2010)

5.4 EL DORADO COUNTY WATER AGENCY WATER USE EFFICIENCY PROGRAM

EDCWA implements water use efficiency programs and pursues funding that supports both purveyors and private water systems. EDCWA is also an associated member of CUWCC. EDCWA's Strategic Plan, adopted in 2011, sets out the Agency's goals and objectives. A primary focus of the document is to support county purveyors in their water conservation programs but also to develop a broader countywide umbrella providing resources and support to all water users in the county. The following select goals and objectives from the Strategic Plan relate directly to water conservation and guide the programs offered by EDCWA.

Engage in community outreach and education

- Present to community organizations
- Educate public on current events and key issues
- Utilize agency website as communication tool
- Develop education program for schools

Enhance reliability of existing and future water supplies

- Advance county-wide drought planning effort
- Promote conservation and efficiency to maximize beneficial use
- Assist residents and purveyors with groundwater supply reliability
- Pursue funding opportunities to achieve greater reliability
- Assist local land use authorities in development and implementation of water related ordinances

Identify and pursue new funding sources

- Build capacity to pursue grants
- Explore fee-based services
- Pursue other sources of public and private support

5.4.1 El Dorado County Water Agency Irrigation Management Services

The Water Agency's IMS program for the West Slope of El Dorado County has been in place since 2001. EDCWA's program is a separate stand-alone program that services areas outside the EID service. Using consulting services, the program serves 70 growers and 156 soil moisture monitoring sites on approximately 850 acres in El Dorado County. This program services approximately 90% of the growers outside of EID's service area. The IMS program includes providing growers with weekly site specific soil moisture monitoring results from moisture sensing nuclear probes and recommended irrigation scheduling by crop. Most of the IMS customers are on unmetered wells but some receive surface water from GDPUD. As shown in **Figure 5-5** the IMS program has grown steadily since its inception. EDCWA budgets $80,000 annually to implement this program.

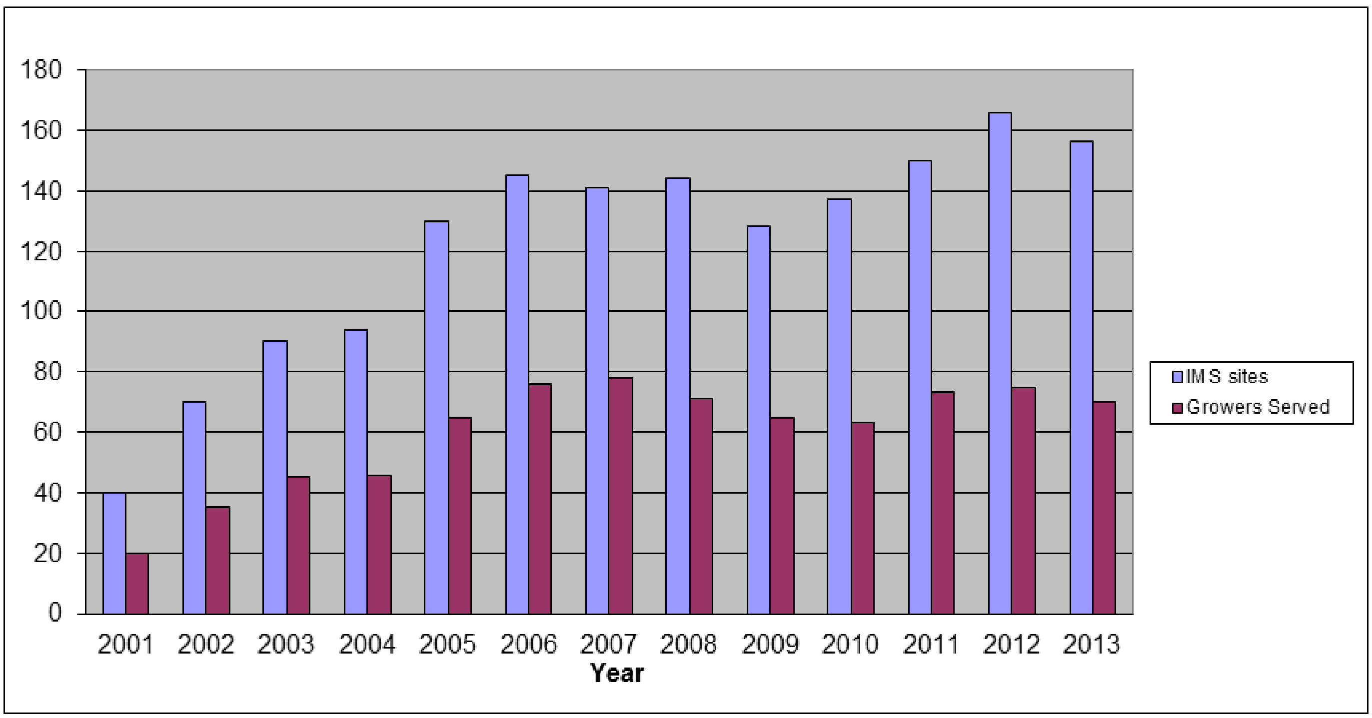

Figure 5-5 El Dorado County Water Agency IMS Sites and Participating Growers

Estimated Water Savings

Water savings is commonly assumed to be the only purpose of an irrigation management program. While conservation is usually a byproduct of irrigation management and typically the goal of a water agency, its functional purpose is efficiency or optimization of the timing and quantity of irrigation by crop type. In other words, the right amount of water, at the right time is provided to produce the best crop. Where publicly purveyed surface water supplies are available, the potential for water savings is greatest as irrigation management reduces overwatering and potential runoff from occurring. In the Water Agency's case, the water supply source for most of the program participants is private wells in fractured rock with limited capacity. The grower's goal is to conserve as much water as is feasible early in the season so that adequate water is available later in the season. The potential for water savings is therefore lower and the focus is more on efficiency.

Although metered data is not available for well water use, water savings resulting from IMS implementation is estimated to be between 6% and 38% depending on whether ground water or surface water is used. The low end of the range is based on capacity limited groundwater use and is inferred using soil moisture data where the grower phased in IMS based irrigation practices over several years. The upper end of the range is based on other foothill IMS programs where publicly purveyed surface water is used for irrigation.

5.4.2 EDCWA Cost Sharing Program

EDCWA offers a grant program to local water agencies and other non-profit water interests with a focus on protecting existing water rights, extending existing water supplies, improving supply reliability and acquiring new water supplies for projected future demands. Over the last five years EDCWA has provided over $5 million in grants to EID, GDPUD, GFCSD, South Tahoe Public Utility District, Tahoe City Public Utility District and the El Dorado/Georgetown Resource Conservation Districts for water supply related projects.

5.4.3 Grant Writing

EDCWA pursues grant funding consistent with the goals and objectives of its strategic plan and has developed projects and/or written applications for urban water conservation plans, government building plumbing and mechanical system retrofits, ditch lining and piping and renewal energy projects on behalf of county purveyors and broader county benefit. The projects and state and federal programs EDCWA has applied to for grant funding are presented in Table 5-2. Renewable energy projects that include in-conduit hydroelectric elements are included as they represent efforts to maximize the efficient and beneficial use of water already diverted into the water system.

Table 5-2 El Dorado County Water Agency Water Use Efficiency Grant Applications

Project	***Grant Funding Source***		***Grant Amount***	***Successful***
CABY Regional Reliability Project including GDPUD and EID ditch lining and piping	Urban /Agricultural Water Use Efficiency Programs	2006	$3,000,000	No
GFCSD Reservoir Lining, Water Reliability and Conservation Project	Sierra Nevada Conservancy	2007	$373,000	No
Placerville - Hangtown Creek Comprehensive Watershed Master Plan	Sierra Nevada Conservancy	2008	$130,000	Yes
EID Pleasant Oak Main Tank 7 Variable Speed Regenerative Drive In-Conduit Hydro Project	California Energy Commission Emerging Technology Demonstration Program	2011	$1,600,000	No
South Tahoe PUD Renewable Energy Regional Exploration Project	California Energy Commission	2012	$750,000	Yes
GDPUD Sandtrap Siphon In-Conduit Hydro Project	California Energy Commission	2012	$1,540,000	No
Placerville Water Line	Integrated Regional	2013	$750,000	Yes

Replacement Program Phase I	Water Management Programs			
EID Tank 7 Small Hydroelectric Projects	Integrated Regional Water Management Programs	2013	$500,000	Yes
GDPUD Ditch Lining	WaterSMART	2014	$300,000	No
GDPUD Ditch Lining Conservation Project	Integrated Regional Water Management Programs	2014	$860,894	Yes
City of Placerville Water Line Replacement Program Phase 2	Integrated Regional Water Management Programs	2014	$745,000	Yes
El Dorado County Government Building Water Efficiency Retrofits and K-8 Water Conservation Education Program	Integrated Regional Water Management Programs	2014	1,775,187	Yes
El Dorado County Water Agency Water Conservation Plan	Integrated Regional Water Management Programs	2014	100,000	Yes
Grizzly Flats CSD Drought Measure and Water System Infrastructure Improvements	Integrated Regional Water Management Programs	2014	492,051	Yes

5.4.4 Achieving Per Capita Conservation Goal

Since 2001 with the implementation of its IMS Program, EDCWA's water resources management role in the County has evolved from a planning agency with the primary goal of protecting existing and acquiring new water rights to an expanded role including targeted water efficiency programs and providing grant funding more focused on water use efficiency. In light of the State's 20 percent water conservation mandate and ongoing drought conditions, EDCWA will need to play an even greater role in assisting the purveyors and others in the county to maximize water use efficiency given local cost effectiveness and the availability of state, federal and private grant funding. To that end and consistent with its strategic plan, EDCWA is considering the creation of an Office of Water Efficiency (OWE).

5.5 STATE-WIDE WATER CONSERVATION CODES AND LEGISLATION

This section describes the building and plumbing codes and new legislation that will generate passive water savings in new developments and existing homes that change ownership or are modified through a building permit process. Water savings resulting from these codes are not quantified for this report.

5.5.1 National Plumbing Code

The Federal Energy Policy Act of 1992, as amended in 2005 requires only fixtures meeting the following standards can be installed in new buildings:

- Toilet – 1.6 gal/flush maximum

- Urinals – 1.0 gal/flush maximum
- Showerhead - 2.5 gal/min at 80 psi
- Residential Faucets – 2.2 gal/min at 60 psi
- Public Restroom Faucets - 0.5 gal/min at 60 psi
- Dishwashing pre-rinse spray valves – 1.6 gal/min at 60 psi

Replacement of fixtures in existing buildings is also governed by the Federal Energy Policy Act; only devices with the specified level of efficiency (shown above) can be sold since 2006. The net result of the plumbing code is that new buildings will have more efficient fixtures and old inefficient fixtures will slowly be replaced with new more efficient models. The national plumbing code is an important piece of legislation and must be carefully taken into consideration when analyzing the overall water efficiency of a service area.

In addition to the plumbing code the US Department of Energy regulates appliances such as residential clothes washers. Regulations to make these appliances more energy efficient has driven manufactures to dramatically reduce the amount of water these machines use. Generally front loading washing machines use 30 to 50 percent less water than conventional models (which are still available). In a typical analysis, cost effectiveness models assume a gradual transition to high efficiency clothes washers (using 19 gallons or less) so that by the year 2020 this will be the only type of machines purchased. In addition to the industry becoming more efficient, rebate programs for washers have been successful in encouraging customers to buy more water efficient models. Given that machines last about 15 years, eventually all machines will be of this type.

5.5.2 State Building Code – CalGreen

The Cal Green requirements affect all new development in the State of California after January 1, 2011. The new development requirements under Cal Green are listed in the table below.

Table 5-3 Cal Green Building Code Summary Table

5.5.3 State Plumbing Code – AB 715

The Plumbing Code includes the new CCR Title 20 California State Law (AB 715) requiring High Efficiency Toilets and High Efficiency Urinals be exclusively sold in the state by 2014. This effects both new construction and retrofits of individual toilets.

5.5.4 California State Law – SB 407

SB 407 (Plumbing Fixture Retrofit on Resale or Remodel): SB 407 begins from the year 2017 in residential and 2019 in commercial properties. This is 25 years after the passage of the National Plumbing Code and perceived beyond the useful life of older inefficient toilets. SB 407 program length is variable and continues until all the older high flush toilets have been replaced in the service area.

Figure 5-6 provides housing data by year built for El Dorado County as compared to California and indicates significant opportunity for water savings resulting from plumbing retrofits in homes built before 1992. A small portion of this potential has already been realized to the extent EID has offered a toilet replacement rebate program since 1995 and has replaced 5,500 toilets with low flow and ultra-low-flow toilets.

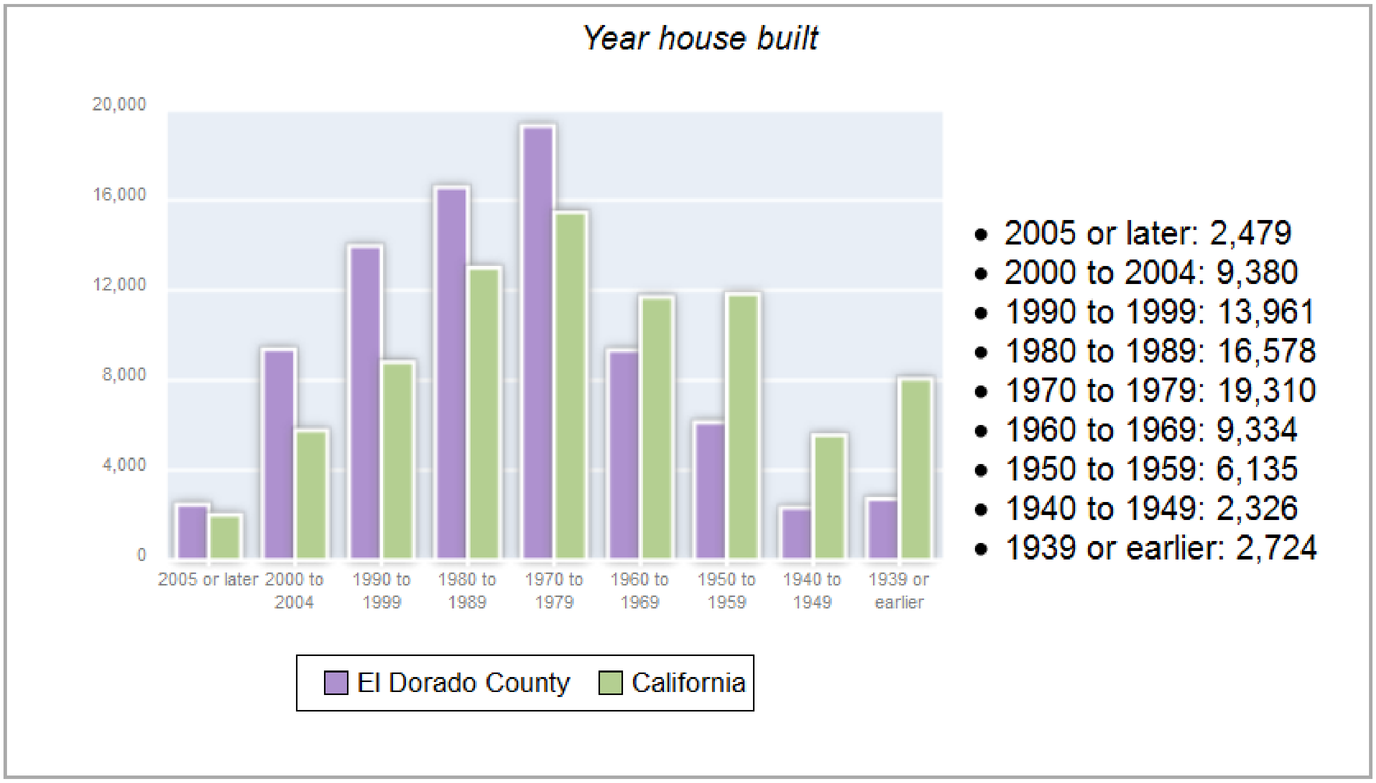

Figure 5-6 El Dorado County and California Housing - Year of Construction
SOURCE: 2010 US Census (http://www.city-data.com/county/El_Dorado_County-CA.html)

5.6 COUNTY WATER CONSERVATION CODES AND LEGISLATION

5.6.1 Landscape Ordinance Implementation

The Water Conservation in Landscaping Act of 2006 (Assembly Bill 1881) required water agencies to adopt landscape water conservation ordinances by January 2010. In the absence of such ordinances, DWR's Model Water Efficient Landscape Ordinance (MWELO) serves as the requisite standard. El Dorado County is currently in the process of updating its Zoning Ordinance and as part of that process, is updating its landscape ordinance to be consistent with General Plan policy requirements for water conservation methods that encourage the use of native, drought tolerant species, reclaimed water, and greywater systems and to ensure it remains as effective in conserving water as the MWELO. Until such time a new ordinance is adopted, the county is operating under the MWELO for all projects submitted as of January 1, 2010.

5.6.2 County Building Codes

The County enforces all state and federal building and plumbing codes.

5.6.3 2004 General Plan Policies

El Dorado County's 2004 General Plan includes a Public Services and Utilities Element (PSUE) to "insure a pattern of development which maximizes the use of existing services while minimizing the costs of providing new facilities and services." The rapid growth experienced by El Dorado County over the last two decades, and resulting strain on services, compelled the County to address public services in its General Plan policies. The PSUE addresses water conservation and water recycling in the following policies:

- Policy 5.2.1.10: The County shall support water conservation and recycling programs and projects that can reduce future water demand, develop and implement a water use efficiency program for existing and new residential, commercial/industrial, and agricultural uses, determine which uses will require recycled water and encourage all purveyors to implement BMP.
- Policy 5.2.1.12: The County shall work with EID to support the continued and expanded use of recycled water, including storage, encourage the construction of distribution lines at the same time as other utilities are installed.
- Policy 5.2.1.15: The County shall support the efforts of the County Water Agency and public water providers to retain existing and acquire new surface water supplies for planned growth and existing and planned agricultural uses including reclaimed water.

5.7 FUTURE GOALS FOR WATER EFFICIENCY BEYOND 2020

Opportunities for conservation evolve with time as operational changes are made, technology advances, customer attitudes shift towards hopefully greater program participation, and progress towards goals are achieved through implementation. As discussed in Chapter 4, target GPCD is used to project 2020 water demands for EID and GDPUD and this chapter describes how the SB X7-7 conservation goal is envisioned to be achieved. Beyond 2020, however, as EID and GDPUD service areas buildout there is the potential for a significant increase in economic activity pursuant to the 2004 General Plan and 2007 FAR General Plan Amendment which translates into a focus on additional commercial water use efficiency in the future.

EDWCA envisions that County residents will continue to benefit from the State of California striving for more efficient use including updates to the Appliance and Plumbing Fixture Codes (CCR Title 20), further refining the goals to be water efficient in the Cal Green Building Codes (CCR Title 24), future revisions to the statewide landscape ordinance as California adopts the "new norm" in native landscaping, and more recycled water codes (CCR Title 22).

Beyond these passive code savings, all the county water purveyors will continue to seek more efficiency from their operations and customers. Each agency will continue monitoring its GPCD and find the most optimal ways to invest rate revenue to maximize water savings. Future decisions on investments in conservation, recycling and other alternative sources are planned to be based on a few common factors, which may include water savings, cost effectiveness, customer service and future regulatory requirements.

As described in Section 5.1.2, the current cost of water for local purveyors is low due to relatively low pumping and treatment costs. Currently, the cost of supply is in the range of $62/acre-foot (EID 2014). Cost effectiveness analyses prepared by the purveyors have taken the simplistic approach of assessing conservation measures based on the current low cost of supply to the cost to implement the conservation measure.

A basic review of the Table 5-4 below (acronyms used in the table are listed immediately following the table) illustrates a long list of current and potential future conservation measures that involve education, incentives or mandates for higher efficiency. For basic qualitative comparison purposes, the range of the current cost of water supply in the County is presented with the unit cost of water savings in $/AF from conservation plans completed elsewhere in Northern California. There are reasons to select a conservation measure even if the unit cost is higher than the avoided cost, namely that its customer service benefit is tied to a key incentive program or the estimated water savings are high enough to warrant the investment to meet GPCD targets or other savings goals. These goals include maximizing outdoor irrigation efficiency to minimize consumption uses in the peak summer months. In general, the majority of conservation measures appear to be more costly on a per unit basis. However, this does not take into account future new water supply avoided cost or a full comprehensive cost effectiveness analysis. Cost effectiveness is driven by future water supply costs, which are expected to be quantified as planning for new water supplies is advanced.

Table 5-4 Summary of Current or Future Potential Water Use Efficiency and Recycled Water Measures

CUWCC BMP No.	Measure Name	Type of Program	Current Local Avoided Cost of Potable Water ($/AF)	Unit Cost of Potable Water Saved[3] ($/AF)	Current Program (Yes/No)	Potential for 20x2020	Future Long Range Potential	Feasible If Additional State Funding Support	Comments	Customer Category	County or Agency Led

<u>List of Acronyms:</u>
AMR = Automated Meter Reading
AF = Acre-Feet
BMP = Best Management Practices
CII = Commercial, Institutional, and Industrial
CUWCC = California Urban Water Conservation Council
HET = High-Efficiency Toilets
HEU = High-Efficiency Urinals
MF = Multifamily
NA = Not Available
SF = Single Family
UHEU = Ultra-High-Efficiency Urinals
UHET = Ultra-High-Efficiency Toilets
WBIC = Weather-Based Irrigation Controller

5.7.1 Long Term Future Potential Conservation Measures

EDCWA intends to undertake a water use efficiency planning effort to better quantify the long term water savings and associated benefits and costs. Enhancements beyond 2020 to the EID and GDPUD conservation programs supported by EDCWA may include some or all of the following:

- More targeted and extensive outreach to customers and local schools (e.g., increased participation in awareness programs such as the US EPA WaterSense Program and California's Save Our Water)
- Installation of Automatic Meter Infrastructure (smart) metering technology
- Provide leak alerts with customer service follow-up to support customers addressing water loss on their side of the meter
- Develop water budgets for all potable irrigated properties over 1 acre or receiving small farm irrigation metered rate
- Providing Water Use Reports to inform customers of their use compared to similar neighboring properties
- Widespread adoption of “smart” software that can connect consumers with specific programs and opportunities to reduce their water use and save on their water bills
- Making greywater systems, rain cisterns, and other water saving opportunities more easily available in the service areas
- Improved coordination with recreational facilities to reduce water use
- Pursue funding for purveyors to provide cost-effective incentives to residential property owners and businesses to increase their efficiency
- Using government owned facilities as high efficiency demonstrations and examples for customers

5.8 FUTURE PLANNING EFFORTS

It is envisioned that an EDCWA Office of Water Efficiency would provide leadership and funding to propel El Dorado County and its water purveyors to a new level of water use efficiency. Activities an OWE could perform include but are not limited to the following:

- Prepare a conservation program plan that includes cost effectiveness analysis;
- Lead the pursuit of state and federal grant funding for water conservation and efficiency projects of local purveyors and EDCWA;
- Administer conservation rebate programs for local purveyors and residents not served or underserviced by public water suppliers;
- Coordinate and lead local outreach and education efforts on water use efficiency and conservation;

- Provide conservation coordinator services to assist the efforts of local purveyors and reach residents on private wells;
- Lead efforts to improve the health and function of local watersheds to improve water supply reliability in the face of heightened risk of catastrophic fire, diminishing snowpack, and warmer temperatures; and
- Work with local agricultural leaders to develop the next generation of IMS services across the county.

The information contained in this chapter is planned for a future update based on the on-going water efficiency efforts by the purveyors and the need for EID and GDPUD to prepare their respective 2016 UWMPs.

Chapter 6. Water Supply Need

This section of the report compares existing and future water demand (with conservation) projections to existing water supplies to determine the unmet water supply need for each purveyor. Future new public water supplies, water efficiency projects and further water conservation measures discussed in Chapter 5 are then identified to meet the ultimate need for the West Slope.

As discussed in the 2007 WRDMP, the County, like the Mountain Counties region in general, has limited water supply options. Publicly developed surface water is the primary water source for the West Slope of the County. Groundwater on the West Slope is limited due to the fractured rock nature of the sub-surface geology. Consequently, the opportunity for groundwater storage or conjunctive use projects directly within the County is very limited. EDCWA is, however, currently working on a ground water banking concept north of the Lower American River in conjunction with the El Dorado Water and Power Authority's Water Reliability Project that is currently under technical, institutional and environmental review.

In this section water supplies and sources are compared to updated water demand projections. This information is presented along with suggested projects and further conservation measures to meet those demands. Water supply information is based on historic watershed hydrologic conditions and includes information for both "firm yield" and "safe yield."

Yield Definitions

The classic definition of yield for a drainage basin is the amount of water that can be supplied from that basin in a specified interval of time. The yield of a drainage basin can be expressed as the total volume over a year or some other time frame. Under this definition, yield can vary from one time period to the next due to differences in the basin hydrology.

In water resources planning it is important to know the minimum water supply that can be delivered from a water supply system. The **safe yield** of a water system is defined by the critical period of that system. The critical period is defined by the most severe drought experienced during the period of record. If a more severe drought occurs, the critical period changes and the safe yield is reduced.

In most water supply systems, temporary shortages of a reasonable magnitude can be accepted for short periods of time. The **firm yield** definition generally allows for some shortages in the dry years. Specific firm and safe yield information is provided in the following purveyor sections.

6.1 EL DORADO IRRIGATION DISTRICT

EID water supply sources are discussed in detail in Chapter 3 of the 2007 WRDMP. For this update the 2007 WRDMP supply (yield) information is supplemented with more current information appearing in EID's 2010 UWMP and 2013 IWRMP.

6.1.1 Current and Additional New Water Supply

As required for UWMPs, a multiple dry year supply reliability assessment is included in the EID 2010 UWMP based on the years presented in Table 6-1.

Table 6-1 El Dorado Irrigation District Water Year Types

Water Year Type	*Base Year(s)*
Normal Water Year	1983
Single-Dry Year	1977
Multiple-Dry Water Years	1987–1992
SOURCE: EID (2011), Table 5-1.	

Table 6-2 provides normal, dry, and multiple dry year supply yields for each existing source of supply and additional new water supplies. The “Pre-1914/Ditch” supply source has been added since the adoption of the 2007 WRDMP. The “Additional Supply” includes additional recycled water that will become available as connections are made to the Deer Creek and El Dorado Hills Wastewater Treatment Plants. Table 6-2 also provides a third water supply scenario that is not included in the 2010 UWMP, but was included in the 2007 WRDMP, that includes existing and additional supplies with 50% CVP cutbacks in the third dry year instead of 25%. This scenario reflects the water shortage condition anticipated in the 2007 WRDMP resulting from climate change and actually imposed by Reclamation in 2014. Further cutbacks to public health and safety levels are possible in 2014 but are not likely with late season precipitation. In late May 2014, the State Water Resources Control Board curtailed all post-1914 water rights, which will further impact EID’s supplies.

Table 6-2 demonstrates the variability of EID’s water supply portfolio. Supply for the first and third year of multiple dry years is 94% and 84% of a normal or average year, respectively. Besides hydrologic variability, lack of access to ground water or other storage options to stabilize available supplies in dry years contributes to less water supply reliability as compared to agencies with access to ground water.

Table 6-2 El Dorado Irrigation District Current and Additional Recycled Water Supply Yield in Normal and Dry Years (acre-feet)

Source	Existing Water Supply			Additional Supply			Existing and Additional Supply			Existing and Additional Supply w/50% CVP Cutback		
	Normal Year	Year 1	Year 3	Normal Year	Year 1	Year 3	Normal Year	Year 1	Year 3	Normal Year	Year 1	Year 3
Sly Park	23,000	22,000	15,500				23,000	22,000	15,500	23,000	22,000	15,500

P-184, Pre-1914	15,080	15,080	15,080				15,080	15,080	15,080	15,080	15,080	15,080
Permit 21112	17,000	17,000	17,000				17,000	17,000	17,000	17,000	17,000	17,000
Recycled	3,084	3,084	3,084	2,516	2,516	2,516	5,600	5,600	5,600	5,600	5,600	5,600
Pre-1914/Ditch	4,560	3,000	3,000				4,560	3,000	3,000	4,560	3,000	3,000
Total	***70,274***	***65,824***	***59,324***	***2,016***	***2,016***	***2,016***	***72,790***	***68,340***	***61,840***	***72,790***	***68,343***	***59,955***

SOURCE: EID (2011), Table 5-3; EID (2013a).

Sly Park Reservoir is operated as a 2-year water supply. Yield is not significantly affected by one dry year but as the reservoir does not refill in a second dry year the water remaining is managed to conserve water for two additional years.

The existing USBR Water Service contract is subject to Reclamation shortage policies.

The Project 184, Pre-1914 water rights are available in all water year types.

Permit 21112 water rights are available in all water year types.

Recycled water is limited to current system capacity and assumes seasonal storage will not be built. (Source EID IWRMP, Table 6-1).

Pre-1914/Ditch water rights are limited to 3,000 acre-feet in dry years.

EID manages its water supplies and meter sales based on the firm yield of its contiguous or integrated system. The current system firm yield of 63,500 acre-feet annually was established using the OASIS Model and is published in Table 2 of EID's annual Water Resources and Service Reliability Report (WRSRR). As stated in the 2013 WRSRR:

> *this number represents an overall water demand that cannot be exceeded until new supplies are added.*

The criteria used in the OASIS Model to determine firm yield originates from EID's Regulation No. 2 (later replaced by Board Policy 5010) that defines system firm yield as:

> *annual demand which the integrated water system can theoretically meet 95% of the time. In the remaining 5% of the time, shortages calculated not to exceed 20% will be allowed.*

Also stated in the 2013 WRSRR is the following:

> *Under this (firm yield) methodology, approximately 95% of the time sufficient water supply is available to meet normal water demands … [emphasis added]*

The firm yield published in the 2013 WRSRR does not include recycled water. For purposes of determining the need for additional water supplies, in **Table 6-3**, recycled water from Table 6-2 is added to the contiguous system firm yield. For safe yield, Year 3 supply for the "Existing and Additional Supply w/50% CVP Cutback" from Table 6-2 is used and does include recycled water. Year 3 represents the most severe drought conditions identified in the 2010 UWMP. The "Existing and Additional Supply w/50% CVP Cutback" scenario includes an increase in CVP supply cutback from 25% to 50% in Year 3 to reflect current 2014 water year conditions.

Table 6-3 El Dorado Irrigation District Firm and Safe Yield Supply

Source	***Existing Water Supply***		***Existing and Additional Supply w/50% CVP cutback***	
	Firm Yield	***Safe Yield***	***Firm Yield***	***Safe Yield***
Contiguous System	63,500		63,500	
Recycled Water	3,084		5,600	
Total	***66,584***	***59,324***	***69,100***	***59,955***
SOURCE: EID (2013), Table 2				

As a comparison, the firm yield supply shown in **Table 6-3** reasonably approximates the Year 1 supplies from Table 6-1 for which the 2010 UWMP states, "It is assumed that overall demands will not change during a single-dry year."

6.1.2 Potential Impacts of Climate Change

As noted in Section 2.7 the potential effects of climate change in the County could include increased water demand (e.g., due to warmer air temperatures) coupled with changes in runoff patterns and increased frequency of drought. These effects suggest a reduction of both surface and groundwater supplies, which would reduce water supply reliability.

Supply Impacts

EID's January 2008 Drought Preparedness Plan (EID 2008) includes a separate report ("A Physically-Based Approach to Drought Planning and Climate Change for the El Dorado Irrigation District" – contained in Appendix B of the Drought Plan) prepared by the Stockholm Environment Institute (SEI). SEI developed 10 climate change scenarios for the watersheds of the South Fork of the American River and the tributaries of Sly Park Reservoir using a Water Evaluation and Analysis (WEAP) decision support model developed specifically for the study watershed. The scenarios were constrained by various assumptions set forth in that report (for example, the EID model was "… prioritized to first meet instream flow requirements …"). These scenarios "… suggested that supply reliability would be reduced by around 10%."

SEI did not specifically evaluate the potential impact of climate change within El Dorado County to future demand, since it mixed such potential impacts with future demand projections associated with growth and does so through the year 2030. It is worth noting that potential impacts to water supply are also a function of legal and water rights constraints, but it is not clear that the SEI report considered water right priorities in reaching conclusions on potential impacts to EID water supplies. Further, as there is no commonly accepted definition of water supply reliability, the precise impact of a 10% reduction in "supply reliability" is not entirely clear.

The Mountain Counties Regional Report (in the draft California Water Plan Update 2013) cites a 2012 study by the Scripps Institution of Oceanography and suggests that the study used "the most sophisticated methodology to date" and included estimates that by mid-century (2060–2069) the Mountain Counties could experience an increase of 3.1–3.4°F (1.7–1.9°C) in winter temperatures and a 5.2–6.5°F (2.9–3.6°C) increase in summer temperatures (DWR 2013, citing work by Pierce et al. [2012]).

In 2013, the Geos Institute released the results of downscaled climate modeling (Geos Institute 2013) for the Sierras for the A-2 (or business-as-usual) emissions scenario (which was developed by the Intergovernmental Panel on Climate Change). The report provides specific estimates of the potential impacts for various atmospheric and hydrologic parameters, including runoff for the Northern, Central, and Southern Sierra. For the Central Sierra, potential changes in runoff are estimated at -3% to -10% (for the period of 2010 to 2029), -2% to +3% (for the period of 2030 to 2039); and -31 to +15% (for the period of 2060 to 2079). Given the considerable range of these projections, the selection of a specific estimate for a decline (or increase) in surface water supplies is difficult.

The potential decline of 2 to 3% in runoff (until 2039) in the Geos Institute report, and the decline of 10% in water supply reliability (through 2030) in the SEI report suggest that the potential for frequent or more prolonged drought conditions should be considered. Further, given the long range purposes of this analysis, consideration of more substantial declines in surface water supplies may be prudent. The existing array of water sources, conveyance systems, and treatment facilities that capture, store, treat and deliver surface water supplies in the County could be inadequate if the availability of surface water supplies is substantially reduced.

Therefore, as a conservative assumption, for the purpose of estimating the water supply needs for the West Slope under buildout conditions, this analysis incorporates a potential reduction of 10% in surface water supplies to account for the potential impacts of climate change.

Demand Impacts

Most of the research related to water resources impacts of climate change has focused on potential impacts to water supplies as they relate to changes in temperature and long-term weather patterns. The science surrounding such evaluations is still fairly new, but reveals that surface water supplies are vulnerable to increasing temperatures. Less studied are the potential impacts of climate change on water demands.

In September 2013 the Water Research Foundation, WRF (a research organization of 950 water utilities in the U.S., Canada, Europe, Australia, and Asia) released its report on Project #4263, "Changes in Water Use Under Regional Climate Change Scenarios" (http://www.waterrf.org/ExecutiveSummaryLibrary/4263_ProjectSummary.pdf). This study was conducted since "…there have been relatively few studies of the potential impacts of climate change on the demand for water…." Using downscaled projections from global climate models and employing a process for selecting climate scenarios, the report developed future ranges of increases in water demands for six water utility service areas in North America:

- Colorado Springs Utilities
- Regional Municipality of Durham (Ontario, Canada)
- Massachusetts Water Resources Authority
- Southern Nevada Water Authority
- San Diego County Water Authority
- Tampa Bay Water Authority

The study methodology looked at water uses that are sensitive to weather – essentially landscape irrigation and any agricultural production supported by these utilities. Presumably, indoor water uses remain unchanged. There is no good match among these case studies with conditions in El Dorado County, based on significant assumed geographic differences in latitude, elevation, summer rainfall and landscape patterns. Growing seasons are shorter at higher elevations and more northern latitude. Summer rainfall in some of the case studies helps to meet summer water demands. One observation from the WRF study is that "…in hot and dry climates of the West average customer demands can be 50 to 80 percent higher than in the humid East…." Further, landscape patterns – particularly total area and plant mix – are drivers of summer water demands. Even so, this provides a qualitative benchmark for water demand vulnerability in El Dorado County.

Projections were made for the years 2055 and 2090. The minimum projected mean annual increases in water demand for each of the case studies is shown in **Table 6-4** below.

Table 6-4 Minimum Projected Increases in Mean Annual Demand by Case Study

UTILITY	*YEAR 2055*	*YEAR 2090*
Colorado Springs Utilities	5.9	7.7
Regional Municipality of Durham	1.6	2.0
Massachusetts Water Resources Authority	1.7	2.5
Southern Nevada Water Authority	3.9	5.2
San Diego County Water Authority	3.5	9.2
Tampa Bay Water Authority	1.2	2.1

These are minimum projections. In several cases the maximum projections are double or triple the minimum projections, reflecting a wide range of uncertainty related to impacts.

The WRF study concludes, as it relates to impacts of climate change on specific water utilities, that "…there is no way of discerning potential impacts without undertaking the types of analyses demonstrated in the case studies." Until better information is developed specific to El Dorado County, it appears prudent to use an irrigation demand factor of 5 percent increase for long-term water resources planning within El Dorado County. The alternatives are to assume there will be no impact of climate change on future water demands, or to assume higher percentages based on a great deal of uncertainty.

While not a purpose of this report, it is clear there may be value in a specific climate change vulnerability assessment – of both supplies and demands – for the American River Basin supported by all water users reliant on such supplies. As noted in the 2007 report on climate change vulnerability by the California Urban Water Agencies, the combined effects of decreasing water supplies and increasing water demands are serious challenges for the future.

Therefore, as a conservative assumption, to estimate the water supply needs for the West Slope under build-out conditions, this analysis also incorporates a potential increase in irrigation demands of 5% to account for the potential impacts of climate change. To be conservative only half of the urban demands are assumed to be outdoor use although outdoor use is generally higher than 50% of the total. For instance, within the recycled water service area of EID where recycled water for irrigation and potable water for indoor use are metered separately, the ratio of outdoor to indoor use is 2.5:1 according EID's Administrative Regulation 1107.

6.1.3 Additional Water Supply Need

In order to determine the need for and quantity of new supply and/or further conservation as discussed in Chapter 5, a comparison of projected supply and demand is necessary. **Table 6-5** provides a comparison of firm and safe yield water supply to the updated target demand projections with conservation. As presented in Table 6-5 there is a need for additional water supply and/or further demand reduction at buildout. When comparing existing water supply with projected demand with conservation the supply deficit ranges from 32,000 acre-feet for firm yield to 39,200 acre-feet for safe yield. When considering additional supplies and 50% CVP cutbacks, the supply deficit ranges from 29,500 acre-feet for firm yield to 38,500 acre-feet for safe yield. As discussed in Chapter 5, the Urban Water Suppliers are committed to achieving conservation and it is assumed that the savings will be sustained, except for increases resulting from increased economic activity. If additional conservation beyond the 20 percent requirement can be achieved, the need for new water supplies would be less.

Table 6-5 El Dorado Irrigation District Water Supply Need with Conservation at Buildout

	Existing Water Supply		*Existing/Additional Supply w/50% CVP Cutback*	
	Firm Yield (acre-feet)	***Safe Yield (acre-feet)***	***Firm Yield (acre-feet)***	***Safe Yield (acre-feet)***
Existing and Additional Recycled Supply	66,584	59,324	69,100	59,955
Demand w/ Conservation	98,534	98,534	98,534	98,534
Target Supply Need	***(31,950)***	***(39,210)***	***(29,434)***	***(38,579)***

When considering potential climate change impacts on EID water supplies and demands identified in the SEI and WRF reports, the magnitude of need increases. **Table 6-6** provides a comparison of demand with irrigation demand increased by 5% to firm and safe yield supplies reduced by 10%, except that: 1) safe yield for the "Existing and Additional Supply" scenario (Table 6-2, Year 3) is used so that CVP supply cutbacks are not overstated; and 2) recycled water is not reduced. In this scenario the firm yield deficit (with recycled water supplies) increases from approximately 29,500 to 39,300 acre-feet while the safe yield deficit increases from approximately 38,500 to 45,300 acre-feet.

Table 6-6 El Dorado Irrigation District Water Supply Need with Assumed 10% Supply Decrease and 5% Increase in Irrigation Demand Due to Climate Change

	Existing Water Supply		*Existing/Additional Supply*	
	Firm Yield (acre-feet)	***Safe Yield (acre-feet)***	***Firm Yield (acre-feet)***	***Safe Yield (acre-feet)***
Existing and Additional Recycled Supply	59,926	53,392	62,190	56,216
Target Demand	101,478	101,478	101,478	101,478
Target Supply Need	***(41,533)***	***(48,087)***	***(39,288)***	***(45,262)***

Figure 6-1, Figure 6-2, and Figure 6-3 provide a graphical comparison of each water supply scenario and the range of growth projections developed in the previous section. From these figures the timing of the need for new supplies can be determined. For the Existing Water Supply scenario shown in Figure 6-1 when considering firm yield, new supply is needed as early as 2028 for the high growth scenario and as late as 2045 for the low growth scenario. *For the medium growth scenario new supply is needed by 2035.* When considering safe yield, new supply is needed as early as 2024 for the high growth scenario and as late as 2036 for the low growth scenario. *For the medium growth scenario new supply in needed by 2029.*

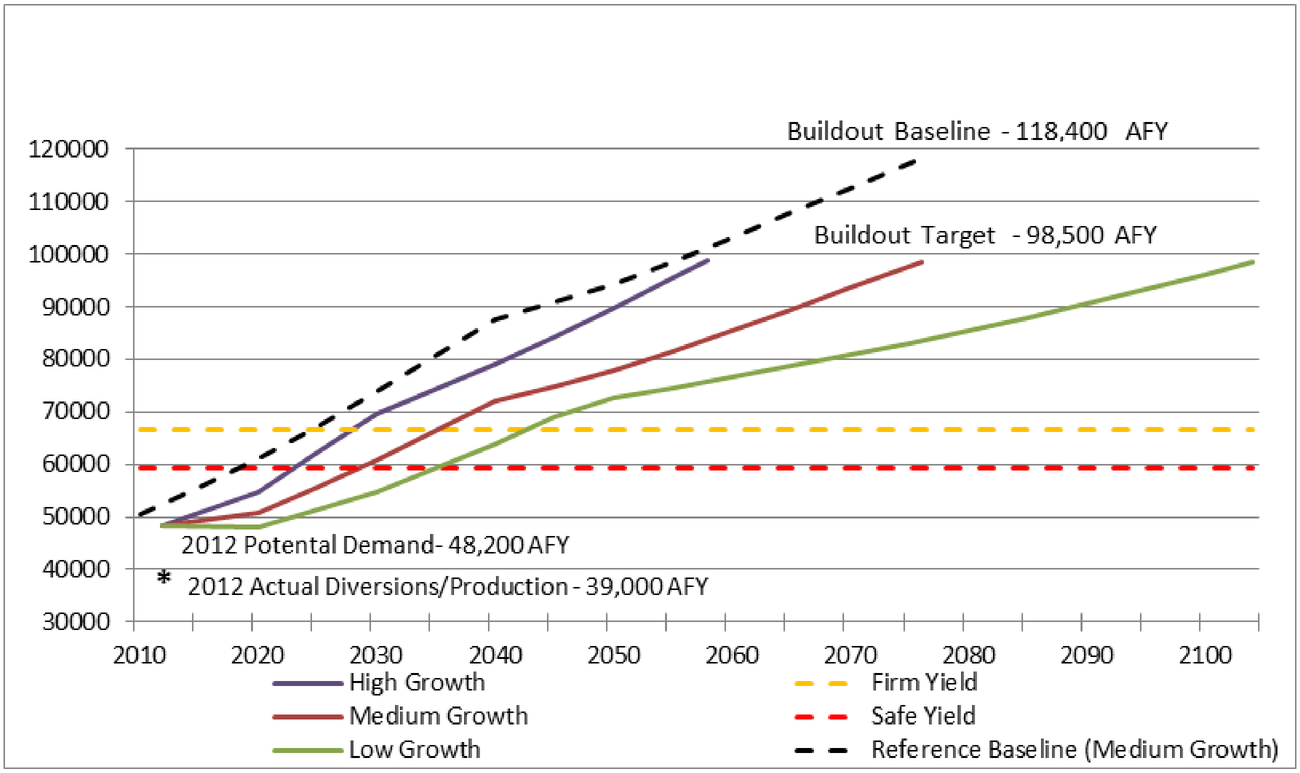

Figure 6-1 El Dorado Irrigation District Existing Supply versus Projected Demand (acre-feet)

For the "Existing and Additional Supply w/50% CVP Cutback" scenario shown in **Figure 6-2**, when considering firm yield, new supply is needed as early as 2030 for the high growth scenario and as late as 2046 for the low growth scenario. *For the medium growth scenario new supply is need by 2038*. When considering safe yield, new supply is needed as early as 2024 for the high growth scenario and as late as 2036 for the low growth scenario. For the medium growth scenario new supply is needed by 2030.

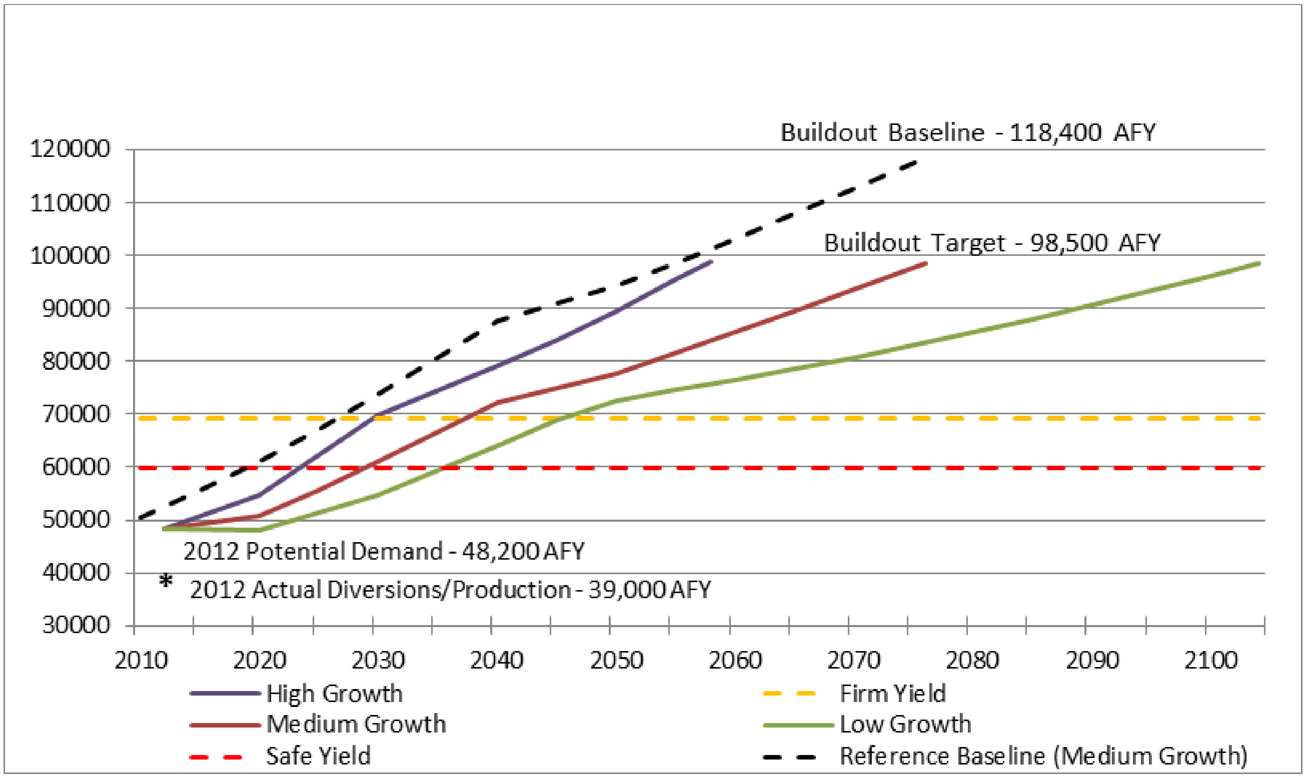

Figure 6-2 El Dorado Irrigation District Existing and Additional Recycled Water Supply w/ 50% CVP Cutbacks versus Projected Demand (acre-feet)

For the "Existing and Additional Supply w/Climate Change" scenario shown in Figure 6-3, when considering firm yield, new supply is needed as early as 2025 for the high growth scenario and as late as 2037 for the low growth scenario. *For the medium growth scenario new supply is needed by 2030.* When considering safe yield, new supply is needed as early as 2022 for the high growth scenario and as late as 2030 for the low growth scenario. *For the medium growth scenario new supply is needed by 2025.*

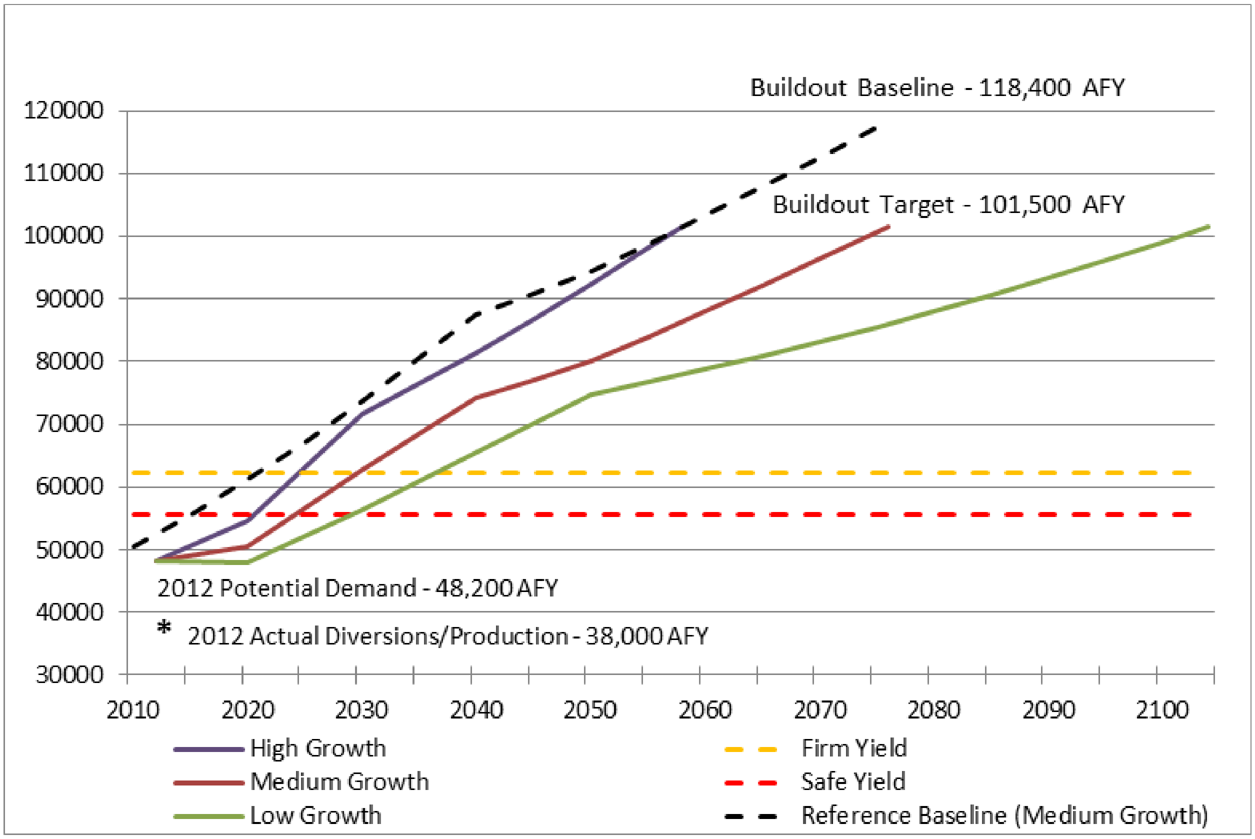

Figure 6-3 El Dorado Irrigation District Existing and Additional Recycled Water Supply versus Projected Demand w/Climate Change (acre-feet)

In order to satisfy these new water supply needs various projects were identified in the 2007 WRDMP and EID's 2013 IWRMP. The most promising of these projects are listed below.

- **Main Ditch Piping-** Piping the Main Ditch between Forebay Reservoir and the Reservoir 1 Water Treatment Plant. This project will reduce seepage and evapotranspiration losses by an estimated 1,300 acre-feet per year. This project is part of EID's plan to achieve its mandated SB X-7 water conservation goal and would not reduce the water supply need identified in this update.

- **Folsom Lake Water Supplies**—A new Water Service Sub-contract with EDCWA for unallocated USBR Central Valley Project water authorized by legislation, Public Law 101-514 (Fazio Water). Under this law, EDCWA was allocated 15,000 acre-feet from Folsom Lake to serve the future municipal and industrial (M&I) needs of the County (West Slope). This water supply is contingent on execution of a new water service contract between EDCWA and Reclamation. For planning purposes it has been assumed that this supply would be shared between EID and GDPUD. The project Environmental Impact Report analyzed a variety of allocation scenarios ranging from 15,000 acre-feet being taken by EID to 11,000 acre-feet being taken by GDPUD and 4,000 acre-feet taken by EID. Section 6.2.3 of this report identifies up to 9,400 acre-feet of additional supply need in the GDPUD service and favorable areas at buildout. GDPUD has limited new supply options and may need the full 9,400 acre-feet from this supply source. It should be noted this supply source is subject to cutbacks up to 50% in dry years under USBR's current and proposed shortage policy, as is the case in

2014. Further cutbacks to health and safety levels are also possible under Reclamation's shortage policy. It is expected that USBR Water Service Contracts will be cut back more frequently in the future under the NMFS 2009 biological opinion on the long-term operations of the CVP and State Water Project. Reclamation's recently completed informal consultation for this project with National Marine Fisheries Service (NMFS) further calls into question the certainty and timing of this supply. According to the NMFS concurrence letter dated June 2, 2014:

> "EDCWA will adhere to restrictions on diversions set forth by Reclamation and/or applicable biological opinions to ensure that the proposed project will not result in any decrease to the available cold water pool in Folsom Reservoir."

The 2009 biological opinion referenced in the concurrence letter requires improvements to Reclamation's:

> "…ability to manage the cold water pool to provide suitable temperatures for steelhead through physical and structural improvements at the dams. More specifically, improvements to the temperature control device at the EID intake structure or the construction of the most effective device for conserving cold water in Folsom Reservoir…"

- **El Dorado Water Reliability Project** (aka Supplemental Water Rights Project) — 40,000 acre-feet of new water from partial assignments of State Filed Application Nos. 5644 and 5645 by action yet to be taken by the State Water Resources Control Board on the applications and petitions filed for such water by the EDWPA, and to be stored in and diverted from SMUD's Upper American River Project in accordance with the El Dorado - SMUD Cooperation Agreement. The water would be supplied via a diversion at SMUD's Whiterock Penstock, located approximately 3 miles northeast of Placerville, and transmitted to a new treatment plant. Under the water rights application water can also be taken at Folsom Lake through existing facilities to potentially backfill CVP shortages in dry years. This water supply option is based on acquiring the water rights and paying for power foregone. This supply source is subject to cutbacks at the Whiterock Penstock in the most critically dry years under the SMUD Cooperation Agreement. Presently, there are no restrictions if taken at Folsom Reservoir.
- **Alder Dam and Reservoir** - The reservoir would have a capacity of 31,700 acre-feet and a safe yield of 11,250 acre-feet. The water would be taken at Jenkinson Lake via the Hazel Creek Tunnel, Forebay Reservoir, downstream at Folsom Reservoir, or at a new point of diversion such as the White Rock Penstock.

Additional water use efficiency projects such as more aggressive pipeline replacements, and implementation of additional water conservation measures discussed in Chapter 5 will also reduce the need for additional supplies.

6.2 GEORGETOWN DIVIDE PUBLIC UTILITY DISTRICT

GDPUD water supply sources are discussed in detail in Chapter 3 of the 2007 WRDMP. For this update the 2007 WRDMP information is supplemented with information that appears in the GDPUD 2010 UWMP and the "2009 Options to Increase Water Supply" report.

6.2.1 GDPUD Current Water Supply

As required for UWMPs a multiple dry year supply reliability assessment is included in the 2010 UWMP based on the years presented in **Table 6-7**.

Table 6-7 Georgetown Divide Public Utility District Water Year Types

Water Year Type	*Base Year(s)*
Single-Dry Year	1977
Multiple-Dry Water Years	1977
SOURCE: GDPUD (2011), Table 17	

Table 6-8 provides normal, dry, and multiple dry year supply yields and demonstrates the variability of GDPUD's water supply in dry years. Supply for the first and third year of multiple dry years is 55% of a normal or average year. Besides hydrologic variability, lack of access to ground water to stabilize available supplies in dry years contributes to poor supply reliability as compared to agencies with access to ground water.

Table 6-8 Georgetown Divide Public Utility District Existing Water Supply in Normal and Dry Years (acre-feet)

Source	*Existing Water Supply*		
	Normal Year	*Year 1*	*Year 3*
Stumpy Meadows Reservoir	20,000	11,060	11,060
SOURCE: GDPUD (2011), Table 17			

GDPUD manages its water supplies and meter sales based on the firm yield of Stumpy Meadows Reservoir. In the 2010 UWMP:

> *Firm Yield is defined as the maximum annual quantity of water that can normally be made available each year under historic hydrologic conditions. Exceptions are allowed in critical and some dry years when a deficiency may be imposed.*

Deficiencies are limited to:

> *… 10 percent for treated water and 50 percent for untreated water in critically dry years. Firm yield values reflect operational losses and water requirements. The firm yield of the 20,000 acre-foot Stumpy Meadows Reservoir is 12,200 acre-feet …*

From the "2009 Options to Increase Water Supply" report the existing safe yield of Stumpy Meadows is 10,541 acre-feet and represents maximum quantity of water that can be made available without deficiency each and every year of the historic record. Firm and safe yields are presented in **Table 6-9**.

It should be noted that firm yield is dependent on the mix of urban and agricultural demands, in that each take deficiencies at different rates. As urban uses increase as a percentage of total demand, the firm yield will necessarily be reduced or percent deficiencies will increase.

Table 6-9 Georgetown Divide Public Utility District Firm and Safe Yield (acre-feet)

	Firm Yield	*Safe Yield*
Stumpy Meadows Reservoir	12,200	10,541
SOURCE: GDPUD (2011), p. 20; GDPUD (2009), p. 19.		

6.2.2 Climate Change Impacts

Unlike EID, there has been no assessment of potential effects of climate change on the Stumpy Meadows watershed. The Stockholm Environment Institute's, "A Physically-Based Approach to Drought Planning and Climate Change for the El Dorado Irrigation District" may be applicable to Stumpy Meadows (located in the American River watershed), since the conclusions were based on "10 climate change scenarios for the watersheds of the South Fork of the American River and the tributaries of Sly Park Reservoir." Although in the neighboring Cosumnes River Watershed, EID's Sly Park Reservoir watershed characteristics are similar to Stumpy Meadows in elevation range and proximity. For these reasons the SEI study may be a reasonable surrogate for estimating the potential effects of climate change on the Stumpy Meadows watershed. As discussed in Section 5.1.2, SEI concluded that supplies "could be reduced by around 10% due to climate change."

6.2.3 Additional Water Supply Need

In order to determine the need for and quantity of new supply, a comparison of existing supply and demand is necessary. **Table 6-10** provides a comparison of firm and safe yield to adjusted Target demand projection. As can be seen in Table 6-10 there is a need for additional water supply. When comparing existing waters supply with projected Target Demand, the supply deficit ranges from 7,700 acre-feet for firm yield and 9,400 acre-feet for safe yield.

Table 6-10 Georgetown Divide Public Utility District Water Supply Need with Conservation

	Existing Water Supply	
	Firm Yield (acre-feet)	*Safe Yield (acre-feet)*
Supply	12,200	10,541
Target Demand	19,930	19,930
Target Supply Need	***(7,730)***	***(9,389)***

When considering potential climate change impacts on GDPUD water supplies using the SEI report (section 6.1.2) as a surrogate and the WRF report for increases in irrigation demand, the magnitude of need increases. **Table 6-11** provides a comparison with irrigation demand increased by 5% and firm and safe yield supplies reduced by 10%. The supply deficit ranges from 9,700 acre-feet for firm yield and 11,200 acre-feet for safe yield.

Table 6-11 Georgetown Divide Public Utility District Water Supply Need with Assumed 10% Supply and 5% Increase in Irrigation Demand Due to Climate Change

	Existing Water Supply	
	Firm Yield (acre-feet)	***Safe Yield (acre-feet)***
Supply	10,980	9,487
Target Demand	20,687	20,687
Target Supply Need	***(9,707)***	***(11,200)***

Figure 6-4 provides a graphical comparison of existing supply and the range of growth projections developed in the previous section. From this figure, the timing of the need for new supplies can be determined. When considering firm yield, new supply is needed as early as 2030 for the high growth scenario and as late as 2045 for the low growth scenario. For the medium growth scenario new supply is need by 2035. These conclusions are generally consistent with those drawn in the GDPUD 2010 UWMP (p. 20).

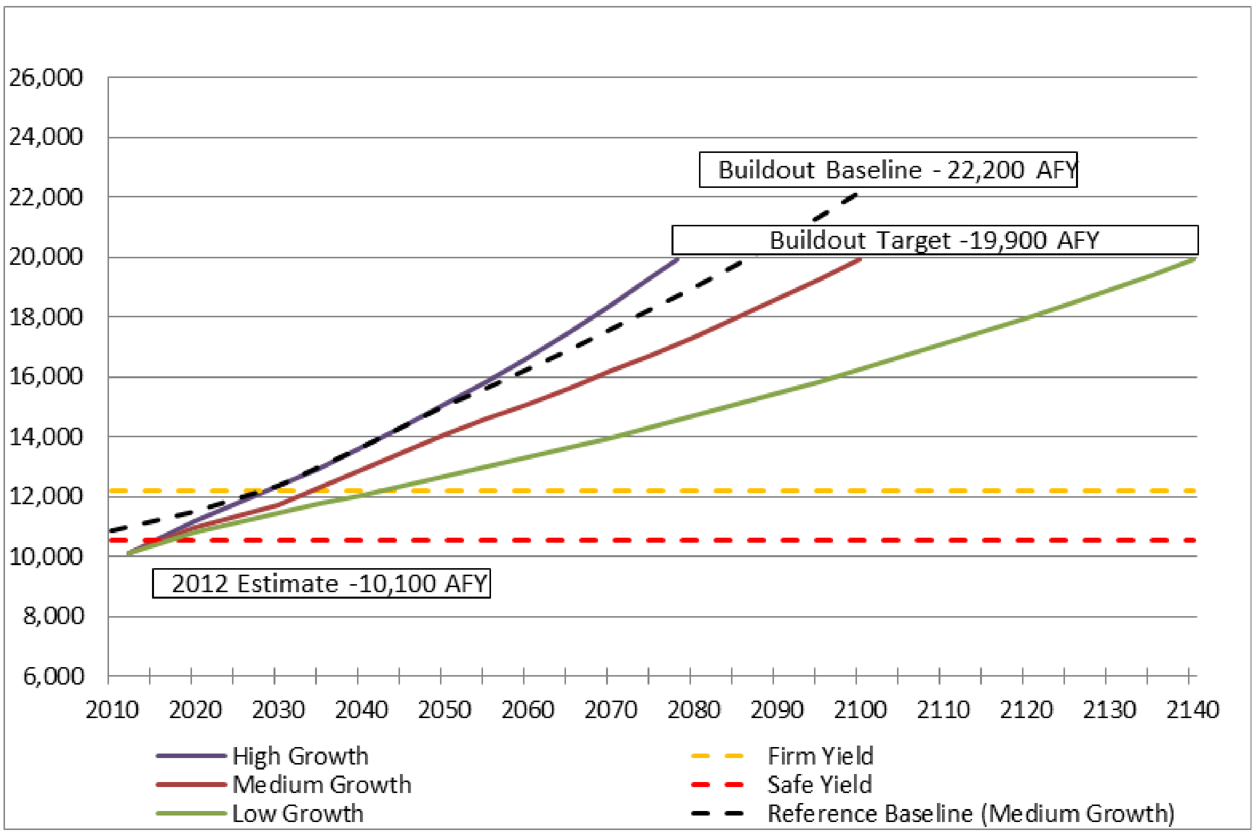

Figure 6-4 Georgetown Divide Public Utility District Existing Water Supply versus Projected Demand (acre-feet)

For the "Existing Supply with Climate Change" scenario shown in **Figure 6-5** new supply is needed as early as 2020 for the high growth scenario and as late as 2025 for the low growth scenario. For medium growth scenario new supply is needed sometime between 2020-2025.

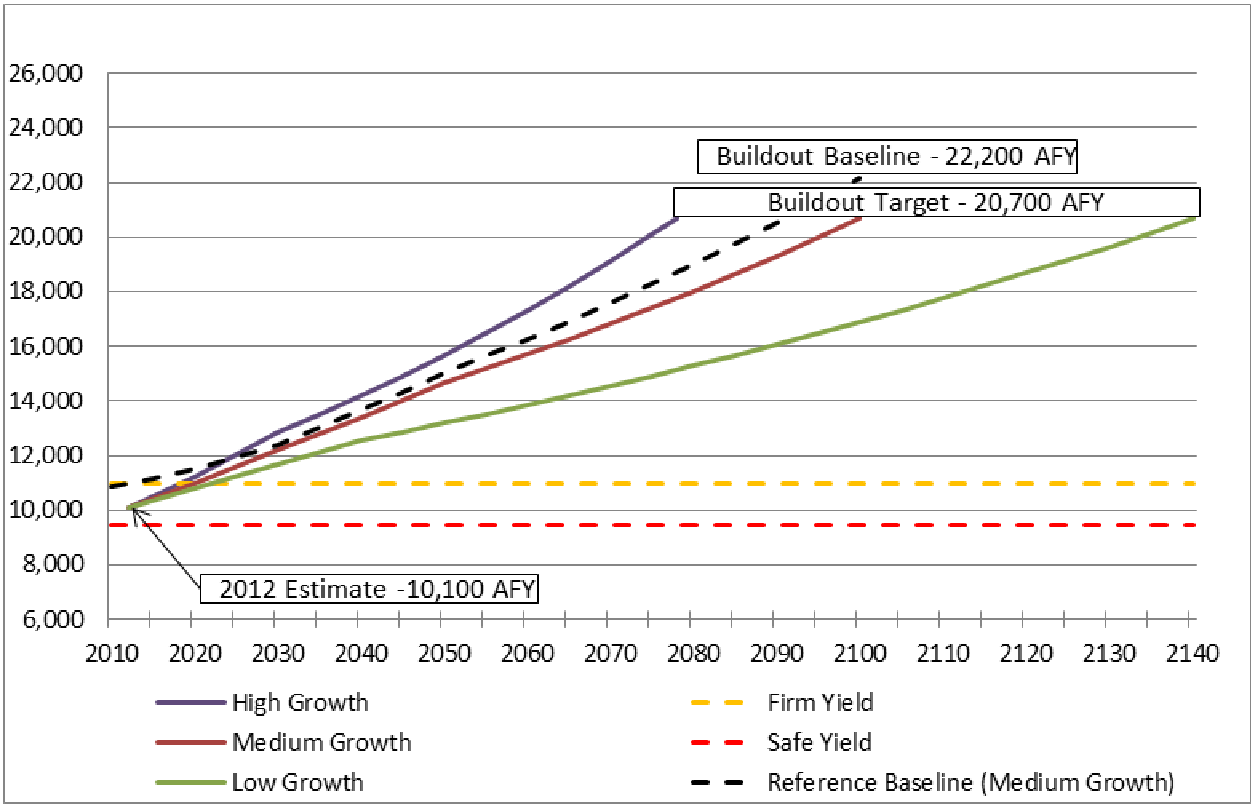

Figure 6-5 Georgetown Divide Public Utility District Existing Water Supply with Climate Change versus Projected Target Demand (acre-feet)

In order to satisfy these new water supply needs, various projects were identified in the 2007 WRDMP and the 2009 Alternatives to Increase Water Supply as follows.

- **Conveyance Canal Loss Reduction**—This option consists mainly of lining portions of unlined open canal sections. It is estimated that 670 acre-feet could be saved through reduction of conveyance losses. This project is part of GDPUD's plan to achieve its mandated SB X-7 water conservation goal and would only partially reduce the water supply need identified in this update.

- **North Fork American River Pumping (aka American River Pump Station)** - Water for this option would be made available from the proposed P.L. 101-514 Water Service Contract at Folsom Reservoir or SMUD's Upper American River Project, both of which would require an exchange with an upstream water rights holders.

  - **Folsom Reservoir Supplies** - A new Water Service Sub-contract with EDCWA for unallocated USBR Central Valley Project water authorized by legislation, Public Law 101-514 (Fazio Water). Under this law, EDCWA was allocated 15,000 acre-feet from Folsom Lake to serve the future municipal and industrial (M&I) needs of the County (West Slope). This water supply is contingent on execution of a new water service contract between EDCWA and Reclamation. For planning purposes it has been assumed that this supply would be shared between EID and GDPUD. The project Environmental Impact Report analyzed a variety of allocation scenarios ranging from 15,000 acre-feet being taken by EID to 11,000 acre-feet being taken by GDPUD and 4,000 acre-feet take by EID. As discussed below, GDPUD has limited new supply options and may need up to 9,000 acre-feet from this supply source.

> - **El Dorado Water Reliability Project** (aka Supplemental Water Rights Project) - 40,000 acre-feet of new water from partial assignments of State Filed Application Nos. 5644 and 5645 by action yet to be taken by the State Water Resources Control Board on the applications and petitions filed for such water by EDWPA, and to be stored in and diverted from SMUD's Upper American River Project in accordance with the El Dorado - SMUD Cooperation Agreement. The water would be available at Folsom Lake and would require an exchange with an upstream water rights holder. This potential supply source would be shared with EID.

- **Rubicon River Diversion**—This option consists of constructing a gravity diversion conveyance system from the South Fork of the Rubicon that would yield 10,300 acre-feet. This option would require a request to EDWPA to negotiate with SMUD under the reopener provision of the El Dorado-SMUD Cooperation Agreement and would likely require payment to SMUD for power foregone.
- **Modification to allowable demand deficiency**—This option considers alternative dry year demand deficiency criteria designed to increase the firm yield of Stumpy Meadows Reservoir. It is estimated that up to 1,000 acre-feet of increased firm yield could be achieved.

Additional water supply options are identifies in the 2009 Alternative to Increase Water Supply. Many of these projects are cost prohibitive, institutionally challenging and/or subject to third party permission and agreement by governmental entities whose favorable participation cannot be compelled. The P.L. 101-514 water supply likely represents the most feasible new supply source in the long run, even with its limitations discussed in more detail in the Section 6.1.3 of this report.

Additional water use efficiency projects such as more aggressive pipeline replacements and implementation of additional water conservation measure discussed in Chapter 5 will also reduce the need for additional supplies.

6.3 GRIZZLY FLATS COMMUNITY SERVICES DISTRICT

GFCSD water supply sources are discussed in detail in the 2012 WSDU. The following section summarizes pertinent supply information from that report for determination of future water supply need.

6.3.1 GFCSD Current Water Supply

The GFCSD water supply comes from two diversions located on North Canyon Creek and Big Canyon Creek within the Cosumnes River drainage basin. The 2012 WSDU includes a firm and safe yield evaluation of these supplies that is provided in **Table 6-12**.

Table 6-12 Grizzly Flat Community Services District Firm and Safe Yield Supply

	Yield	*Critical Water Year, Month*
Safe Yield	165	1989, October
Firm Yield	184	1961, October
SOURCE: GFCSD (2012), Tables 8 and 10.		

From the 2012 WSDU, GFCSD defines firm yield as the water supply needed meeting demand in 95 out of 100 years. Safe yield is defined as the maximum amount of water that can be made available in any year, including the driest year(s) of record.

6.3.2 Climate Change Impacts

Unlike EID, there has been no assessment of potential effects of climate change on the GFCSD water system yield. The Stockholm Environment Institute's, "A Physically-Based Approach to Drought Planning and Climate Change for the El Dorado Irrigation District" may be applicable to GFCSD since the conclusions were based on "10 climate change scenarios for the watersheds of the South Fork of the American River and the tributaries of Sly Park Reservoir." EID's Sly Park Reservoir is within the Cosumnes River (North Fork) watershed as are North Canyon and Big Canyon Creeks (Middle Fork). For this reason the SEI study may be a reasonable surrogate for estimating the potential effects of climate change on the North Canyon and Big Canyon Creek. As discussed in Section 6.1.2, SEI concluded that "supplies could be reduced by around 10% due to climate change."

6.3.3 Additional Water Supply Need

In order to determine the need for and quantity of new supply, a comparison of existing supply and demand is necessary. **Table 6-13** provides a comparison of firm and safe yield to the demands from Table 4-17. As can be seen in Table 6-13 there is a need for additional water supply. When comparing existing water supply with projected demand, the supply deficit ranges from 129 acre-feet for firm yield and 148 acre-feet for safe yield.

Table 6-13 Grizzly Flats Community Services District Water Supply Need

	Existing Water Supply	
	Firm Yield (acre-feet)	***Safe Yield (acre-feet)***
Supply	184	165
Demand	313	313
Supply Need	***(129)***	***(148)***

When considering potential climate change impacts as set forth in the SEI report the magnitude of need increases. The GFCSD demand is not increased since the service area is within a dense conifer forest at an elevation of 3,900 feet with very little outside irrigation. **Table 6-14** provides a comparison of projected demand to firm and safe yield supplies reduced by 10%.

Table 6-14 Grizzly Flats Community Services District Water Supply Need <u>with Climate Change</u>		
	Existing Water Supply w/Climate Change	
	Firm Yield (acre-feet)	***Safe Yield (acre-feet)***
Supply	167	149
Demand	313	313
Supply Need	***(146)***	***(164)***

Figure 6-6 and Figure 6-7 provide a graphical comparison of each water supply scenario and demand projections developed in the previous section. From these figures the timing of the need for new supplies can be determined. For the "Existing Water Supply" scenario shown in **Figure 6-6** when considering firm yield, new supply is needed by 2027. When considering safe yield new supply is needed by 2018.

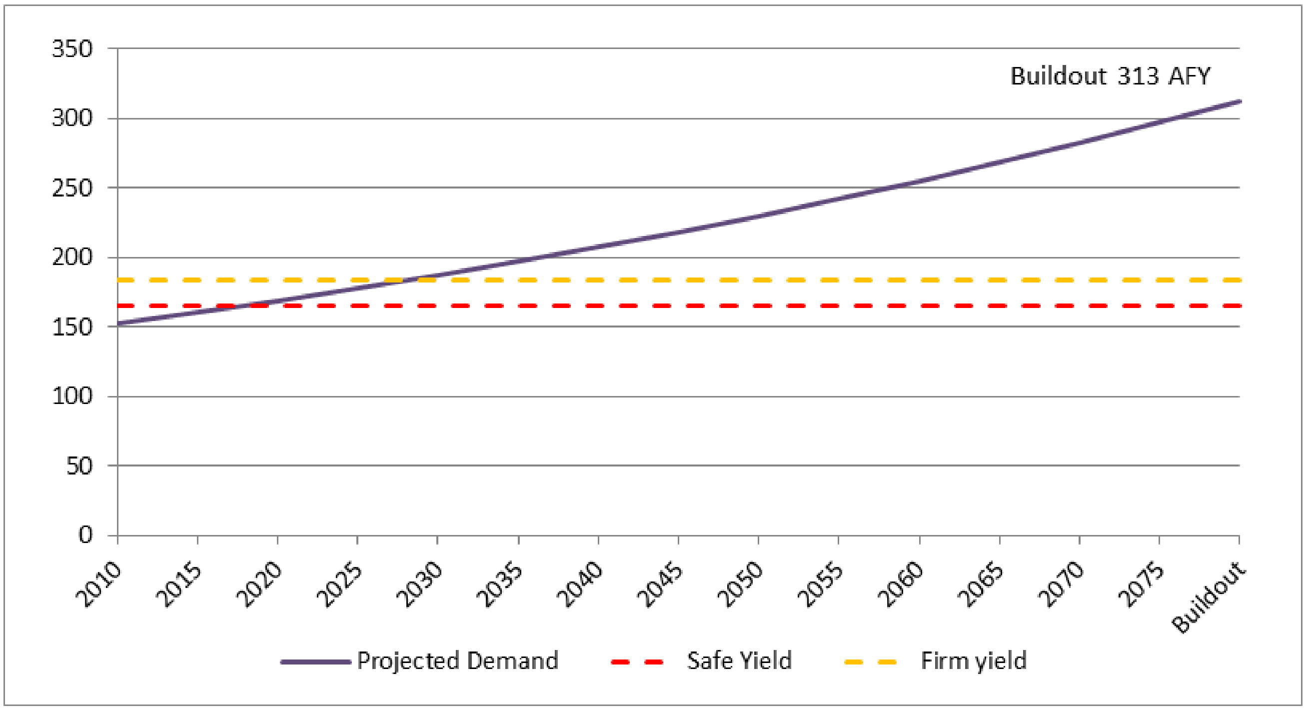

Figure 6-6 Grizzly Flat Community Services District Existing Supply versus Projected Demand (acre-feet)

For the "Existing Supply with Climate Change" scenario shown in **Figure 6-7** new supply is needed as early as 2018.

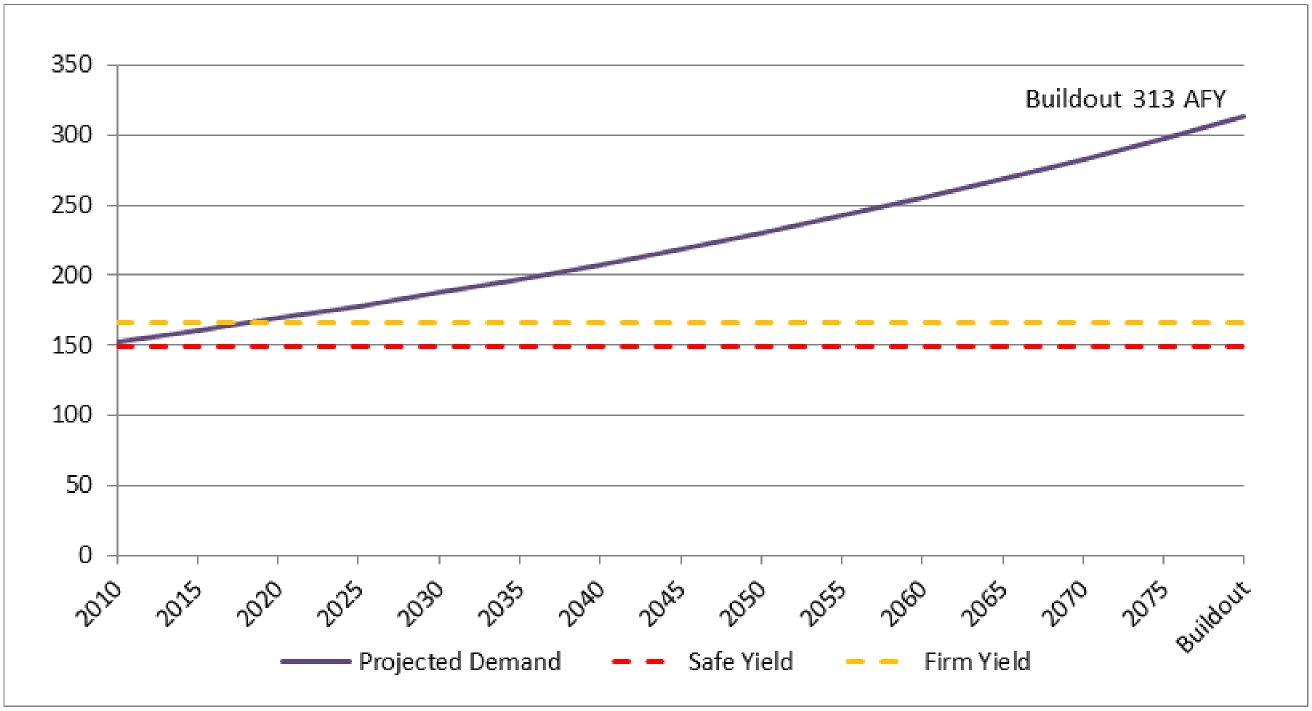

Figure 6-7 Grizzly Flat Community Services District Existing Supply with Climate Change versus Projected Demand (acre-feet)

In order to satisfy these new water supply needs, two projects are identified in the 2012 WSDU. The most promising of these projects is listed below:

- **Lincoln Hill Off-Stream Storage** - Off-stream storage reservoir with active storage of 150 acre-feet estimated to increase safe yield to 318 acre-feet annually.

Additional water use efficiency projects such as more aggressive pipeline replacements and implementation of additional water conservation measures discussed in Chapter 5 will also reduce the need for additional supplies.

Chapter 7. Conclusions

This chapter provides a summary of West Slope water supplies, demand projections and future water need. Conclusions are set forth regarding how water supply adequacy should be measured, as well as the quantity of additional water supply need under the historic hydrologic regime and under the climate change hydrologic regime considered in this update. Three additional points related to future considerations are provided at the end of this chapter.

Various metrics can be used in assessing water supply availability and adequacy. One standard, safe yield, defines the maximum amount of water that can be made available in any year, including the driest year of record. It differs from firm yield, which takes into account imposed deficiencies, based on adopted policy, during periods of drought and, therefore, defines an annual quantity that can be met in most, but not all years. Based on these differences, safe yield and firm yield are typically used in water management projections for differing purposes. Safe yield, as the maximum amount of water conceivably available based on all water year types, is more commonly used in long-range water supply planning as it is based primarily on water rights, physical constraints, and watershed hydrology. Alternatively, firm yield is used for shorter term water supply management decision-making. Both are presented below.

The “Medium Growth Rate” scenario projections are used to estimate both intermediate and long term supply needs, and those projections indicate a long-term need for additional water supplies and/or the precise timing of that need will depend on the future West Slope growth rate.

Table 7-1 focuses on ***short term water supply management using firm yield*** and generally indicates that all West Slope purveyors have adequate supplies to meet near-term demand under historic hydrologic conditions and current firm yield policies. At full buildout of the 2004 General Plan, however, approximately 58,000 acre-feet per year (AFY) of additional water supplies could be needed to meet projected demand on the West Slope when considering firm yield supplies.

Table 7-2 focuses on ***long-term planning using safe yield*** and indicates new supplies are needed for all purveyors at buildout of the 2004 General Plan, with approximately 69,000 AFY of additional water supply needed for the entire West Slope.

For EID, yield values include additional recycled water that will become available as new connections are made to the system. Urban demands in OCA not reallocated to EID and GDPUD are assumed to be satisfied with existing individual wells, except that 25% are assumed to need access to a public water supply at some time in the future either through annexations of lands into the public water supplier service area, extension of service to areas where well production is declining or wells have failed, or through transport of water by truck to existing residents that cannot economically connect to a public water supply system. Agricultural demands in the OCA’s are, however, reflected in new water supply need, as meeting this level of water demand may not be possible or sustainable with groundwater supplies.

Under a climate change hydrologic regime firm yield could look very different and could decrease to near historic hydrologic safe yield levels, confirming that safe yield is appropriate for use for long range planning purposes.

When incorporating the assumed 10% reduction in surface water supply and 5% increase in irrigation demands due to climate change, water supply need could be as high as 70,000 AFY at full buildout when considering firm yield supply as shown in **Table 7-3**. Similar information is shown in **Table 7-4** considering safe yield supplies. The new water supply need when considering safe yield at full buildout could be up to 70,000 AFY.

The analyses in this report are based on projections of both demand and supply based on a variety of assumptions, as well as efforts to provide a range of the potential water supply need for each water purveyor and the West Slope as a whole. However, the 2014 Update was completed during a time of increased uncertainty with regard to impacts of both supplies and demands from continuing severe drought conditions, and unprecedented curtailment of senior water rights by the State Water Resources Control Board. In 2014 the U.S. Bureau of Reclamation also imposed severe cutbacks on its water service contracts, and earlier in the year imposed record cutbacks to its water right settlement contractors (restored to specific contract cutback limits following rains in February and March). There are also some uncertainties with regard to the potential impacts of climate change. Finally, there continue to be regulatory pressures aimed at more water entering the Sacramento-San Joaquin Delta, and such pressures threaten the reliability of upstream water supplies and water users. Considering these circumstances it is prudent to consider all options for augmenting future water supplies and achieving greater water conservation for the West Slope, and in addition explore opportunities to improve water supply conditions during prolonged droughts.

There are three additional considerations for the future addressed in this 2014 Update. The first is the future potential for additional water conservation. Urban utilities throughout California are focusing their efforts on meeting the urban water conservation mandates in SB X7-7. Conservation efforts are not likely to stop at that point, and it is likely that future conservation efforts will be pursued in El Dorado County. Chapter 5 sets forth a number of potential programs, noting that the implementation of any of these programs will be subject to a range of feasibility measures including cost-effectiveness.

A second consideration reflects that the 2014 Update is a significant update to forecasted water demands on the West Slope and that there is value in revisiting data and key assumptions in future updates as more information becomes available (for example, the upcoming updates to urban water management plans which are due July 2016) and the impacts of future growth are experienced. We are in a time of substantial change, recognizing the emerging concerns related to climate change, the remarkable disruption of the recent prolonged economic recession which followed a time of unprecedented growth, and continued changes in water policy.

Finally, while not a purpose of this 2014 Update, Chapter 6 notes that there may be value in a specific climate change vulnerability assessment – of both supplies and demands – for the American River Basin supported by all water users reliant on such supplies. This includes all downstream water users (including environmental uses). It is clear that there is statewide interest in water supplies generated within the American River watershed. As noted in the 2007 report on climate change vulnerability by the California Urban Water Agencies, the combined effects of decreasing water supplies and increasing water demands are serious challenges for the future.

7.1 KEY FINDINGS

In summary, the key findings of the 2014 West Slope Update are listed below.

- Under short term water supply management policies, all West Slope purveyors have adequate supplies to meet near term demand under historic hydrologic conditions and current firm yield policies.
- Under long term safe yield planning assumptions, new supplies are needed for all West Slope purveyors at buildout of the 2004 General Plan, with approximately 69,000 AFY of additional water supply needed for the entire West Slope.
- The climate change hydrologic regime scenario confirms safe yield is the appropriate metric for assessing long term water supply need.
- Considering unprecedented water rights curtailment in 2014 and prolonged drought conditions, it is prudent for EDCWA and West Slope purveyors to consider all options for augmenting future water supplies and achieving greater water conservation for the West Slope.
- An American River Basin climate change vulnerability assessment supported by all water users reliant on such supplies may be valuable to understanding potential basin specific impacts.
- An EDCWA Office of Water Efficiency would provide needed leadership and funding to assist water purveyors in meeting existing and potential future State mandated water use efficiency.

El Dorado Irrigation District

Board Policies (BP) and Administrative Regulations (AR)

TABLE OF CONTENTS

El Dorado Irrigation District

BP 0000 MISSION, GOVERNANCE, STANDARDS, ACCOUNTABILITY

BP 0010 District Mission Statement

Adopted: December 11, 2006

The El Dorado Irrigation District is a public agency dedicated to providing high quality water, wastewater treatment, recycled water, hydropower, and recreation service in an environmentally and fiscally responsible manner.

Strategic goals include:

- Maintain continuous, dependable water service and a clean, healthy water supply
- Provide quality wastewater collection, treatment and disposal service
- Provide recycled water in geographic locations where feasible
- Generate hydro-electric power, when appropriate, and according to the FERC requirements
- Ensure opportunities for quality recreation
- Ensure District operations consistently meet all appropriate environmental and other regulations

El Dorado Irrigation District

BP 0020 Professional Governance Standards

Adopted: December 11, 2006

The El Dorado Irrigation District Board of Directors believes that to govern effectively, individual Board members must work with the General Manager, the General Counsel, and with each other to ensure that District operations meet the standards of the District Mission Statement.

This team approach recognizes the separate governance role of the Board and allows the team to assume collective responsibility for building unity and creating a positive work environment for the benefit of the District's customers and employees.

El Dorado Irrigation District

BP 0030 Accountability

Adopted: December 11, 2006

The El Dorado Irrigation District Board of Directors is committed to ensuring that the District is accountable to the public it serves. A General Manager and General Counsel accountability report is an appropriate way to inform the community about the state of the District. The process of developing and maintaining a General Manager and General Counsel accountability report gives the District staff opportunities to review achievements, identify areas for improvement, enlist community support, and establish a vision for the future.

The components of the General Manager and General Counsel accountability report will be established annually to be evaluated the following year during the Board conducted performance evaluation process.

AR 0031 Emergency Response

Approved: December 12, 2006

The District will conduct emergency operations in accordance with EID Board Resolution No. 2006-075 (Adoption of the National Incident Management System) or its successor and pursuant to the EID Emergency Response Plan.

El Dorado Irrigation District

BP 0040 Standards of Behavior

Adopted: December 11, 2006

El Dorado Irrigation District is committed to providing high-quality services with respect and courtesy to customers and co-workers alike.

The General Manager is responsible for creating and enforcing standards of behavior that reflect compliance with all applicable laws and regulations, respects diverse views and expectations, and is committed to open, fiscally sound measures and Board directed guidelines to achieve performance excellence.

The General Counsel is responsible for ensuring the District's legal positions are represented and that District business is conducted in compliance with all applicable laws and regulations.

AR 0041 Code of Ethics for Standards of Behavior

Approved: December 12, 2006

Employees shall provide services with integrity and are expected to maintain high standards in their working relationships. These standards include the following:

- **Obey the law**. We will conduct our business in accordance with all applicable laws and regulations. Compliance with the law does not comprise our entire ethical responsibility. Rather, it is a minimum, absolutely essential condition for performance of our duties.

- **Promote a positive work environment that supports doing what is right, respecting others, and performing to the best of our abilities**. While everyone who works for the District must contribute to the creation and maintenance of such an environment, our executives and management personnel assume special responsibility for fostering a work environment that will bring out the best in all of us. Supervisors must be careful in words and conduct to avoid placing, or seeming to place, pressure on subordinates that could cause them to deviate from acceptable ethical behavior.

- **Work safely: Protect yourself, your fellow employees, and District facilities**. We are committed to providing a drug-free, safe, and healthy work environment. Each of us is responsible for compliance with environmental, health, and safety laws and regulations. Observe posted warnings and regulations. Report immediately to the appropriate management any accident or injury sustained on the job or any safety concern.

- **Make accurate public disclosures**. We must assure that all disclosures and other public communication are full, fair, accurate, and timely and understandable.

- **Avoid conflicts of interest**. Avoid any relationship, influence, or activity that might impair or even appear to impair your ability to make objective and fair decisions when performing your job.

- **Accountability**. Each employee is responsible for adherence to the standards of conduct set forth in this Code and for raising questions if the standards are not being met. Violations of this

Code are cause for corrective action, which may include disciplinary action.

El Dorado Irrigation District

BP 1000 BOARD POLICY PURPOSE AND ENFORCEMENT

BP 1010 Introduction

Adopted: December 11, 2006

The El Dorado Irrigation District is governed by a five-member Board of Directors pursuant to Irrigation District Law (Water Code §§20500, et seq.). The members are elected to four-year terms on a staggered basis from five geographically identified divisions in the service area. At least every five years the division boundaries are re-evaluated to ensure population is equally distributed among the divisions and the other criteria specified by California Election Code section 22000(a) are considered. The Board sets policy for the District and provides leadership on behalf of District customers.

The Board of Directors establishes the Board meeting schedule, location and time of the meetings.

The Board hires, may terminate, and directs the General Manager and the General Counsel pursuant to their separate employment contracts. All other employees of the District, except for the legal office, work under direction of the General Manager.

AR 1010 El Dorado Irrigation District

Approved: December 12, 2006

The El Dorado Irrigation District is a public agency located in El Dorado County, California, with headquarters in the City of Placerville. Included in the District's service area are the communities of Cameron Park, Camino, Diamond Springs, El Dorado, El Dorado Hills, Placerville, Pollock Pines, Shingle Springs, Rescue, and many smaller communities.

EID is an irrigation special district organized in 1925 under the Irrigation District Law (Water Code §§20500, et seq.). Its original purpose was to ensure domestic water for Placerville and irrigation water for local farmers. The District now provides water, wastewater treatment, recycled water, hydroelectric and solar power generation, recreation, and water-use efficiency services.

The Board meets on the second and fourth Mondays of every month, beginning at 9:00 am, in the Board Room of the Harry J. Dunlop Customer Service Building on Mosquito Road in Placerville. Public participation at Board meetings is recognized as an essential part of representative government and the Board encourages public comments in the decision-making process.

BP 1020 Purpose

Adopted: December 11, 2006
Revised: January 28, 2013

The purpose of these Policies is to set forth the role of the Board of Directors and the responsibilities of the General Manager and the General Counsel in carrying out the terms and conditions under which El Dorado Irrigation District provides services to its customers.

The Policies are to direct the operations and administration of the District in a way that ensures that services are provided at the lowest possible cost, consistent with District goals and objectives, and are generally equitably distributed among those benefited, or by other specific policy of the Board.

The Board of Directors has the authority to interpret these Policies and to rule on any point of contention that is not specifically covered herein.

The Policies, as currently amended, are maintained on file at the District's headquarters on Mosquito Road in Placerville. Copies, in either standard format or alternative formats suitable for persons with disabilities, are available to the public upon request.

El Dorado Irrigation District

BP 1030 Amendments

Adopted: December 11, 2006

The Board of Directors may amend the Policies by an affirmative vote of at least three members at a publicized public hearing.

El Dorado Irrigation District

BP 1040 Restriction, Wrongful Acts, and Enforcement

Adopted: December 11, 2006

The District is authorized under California statutes to establish and enforce its Board Policies and to enforce certain laws and restrictions referenced herein. Civil Code Sections 1882-1882.6 permits the District to file a civil action for damages for the unauthorized taking of District water, illegal or unauthorized connections to any facilities owned or used by the District to provide services, and tampering with District property. The statutes also permit the recovery of three times the amount of actual damage, plus the costs of suit and reasonable attorneys' fees. Numerous Penal Code Statues criminalize similar misconduct.

Any violation of these Policies shall be cause for the Board of Directors or their designee to apply such penalties as may be provided by law, file a criminal complaint, or to take any other action as deemed appropriate, including the discontinuance of drinking water, recycled water, wastewater, and recreation services.

At recreation facilities owned, operated, or leased by the District, EID's recreation staff are authorized and empowered to enforce District rules and regulations, as well as state and local codes, relating to the safe use of the facilities. Staff may issue citations for violations or eject or exclude any violator as specified in the Park Operations Manual, pursuant to BP 10000 Recreation.

AR 1040 Wrongful Acts Subject to Penalties

Approved: December 12, 2006

The following acts are considered violations of state law and are subject to penalties imposed by the District and/or criminal authorities.

No person shall:

a) divert or cause to be diverted any District water, wastewater, or recycled water flow without authorization or consent of the District;

b) make or cause to be made any connection or re-connection to facilities owned or used by the District in order to obtain water, wastewater, or recycled water service without authorization or consent of the District;

c) prevent any meter from accurately performing its measuring functions by tampering or any other means;

d) tamper with any property or facilities owned or used by the District to provide potable water service, recycled water service, or wastewater service;

e) use or receive direct benefit from the District's facilities with knowledge or reason to believe that the diversion of water or the tampering or unauthorized connection with District water or wastewater facilities existed at the time of such use, or that the use or receipt of benefit was without authorization or consent of the District; or

f) cause damage to any water, sewer, or recycled water facility or related appurtenances above or below ground through by carelessness or neglect.

AR 1041 Water Waste Prohibition

Approved: February 26, 2008
Revised: August 27, 2008
Revised: March 2, 2009
Revised: March 31, 2014

The District prohibits uses of District-supplied raw, potable, and recycled water that constitute water waste. The objective is to encourage reasonable use of water supplies by prohibiting all intentional or unintentional water waste, including the use of wasteful equipment or techniques, when a reasonable solution or alternative is available. See AR 5011 for additional water waste regulations that apply during declared drought conditions.

AR 1041.1 Definition of Water Waste

Any of the following acts or omissions, whether willful or negligent, shall constitute the waste of water.

A. Causing or permitting water to discharge, flow, or run to waste into any gutter, sanitary sewer, water course, or storm drain, or to any adjacent lot, from any tap, hose, faucet, pipe, sprinkler, or nozzle. In the case of irrigation, "discharge," "flow," or "run to waste" means that the earth intended to be irrigated has been saturated with water to the point that excess water flows over the earth to waste. In the case of washing, "discharge," "flow," or "run to waste" means that water in excess of that necessary to wash, wet or clean the dirty or dusty object, such as an automobile, sidewalk, or parking area, flows to waste.
B. Allowing water fixtures or heating or cooling devices to leak or discharge.
C. Maintaining ponds, waterways, decorative basins, or swimming pools without water recirculation devices.
D. Backwashing so as to discharge to waste swimming pools, decorative basins, or ponds in excess of the frequency reasonably necessary to maintain the clarity and cleanliness of the water.
E. Operation of an irrigation system that applies water to an impervious surface or that is in disrepair.
F. Use of a water hose not equipped with a control nozzle capable of completely shutting off the flow of water except when positive pressure to leave the hose on is applied.
G. Irrigation of landscaping during rainfall.
H. Overfilling of any pond, pool, or fountain that results in water discharging to waste.
I. Failure to comply with any conservation practices during a District-declared drought.

AR 1041.2 Exceptions

Notwithstanding AR 1041.3, the following acts do not constitute the waste of water.

A. Flow resulting from temporary water supply system, water fixture, or heating/cooling device failures or malfunctions lasting 48 hours or less.
B. Flow resulting from firefighting or routine inspection of fire hydrants or from fire training activities.
C. Water applied to abate spills of flammable or other hazardous materials, where water is an appropriate abatement methodology.
D. Water applied to prevent or abate imminent health, safety, or accident hazards when alternate methods are not available.

AR 1041.3 Informing District Customers of the Regulation

The District shall inform customers at least once a year of the water waste regulation, either through a special item in the newsletter that accompanies each two-month bill or as a separate insert in the bill.

AR 1041.4 Enforcement

To enforce this regulation, District personnel will follow the process outlined in AR 1041.5, *Penalties for Violation of the District's Water Waste Regulation*.

AR 1041.5 Penalties for Violation of the District's Water Waste Regulation

District personnel may report or receive reports of violations of AR 1041, which prohibits uses of raw, potable, and recycled water that result in waste. Violations will be penalized as follows:

- First reported violation of any provision of AR 1041: the District shall issue to the customer a written warning notice of and direction to cease and desist violation.
- Second reported violation of any provision of AR 1041: the District shall levy a fine on the violator's bill of $100, or 20% of the two-month water bill, whichever is greater.
- Third reported violation of any provision of AR 1041: the District shall levy a $200 fine on the violator's bill. If all three violations occurred within a 12-month period, the District may elect to discontinue service of the water supply that has been wasted. If service is discontinued due to AR 1041 violations, the District will charge a reconnection fee of $100 to restore service after abatement of the violation and payment of the fine.

Restoration of service may occur without prejudice to any party's position pending appeal under AR 1041.6.

Fourth reported violation of any provision of AR 1041: the District shall levy a $500 fine on the violator's water bill. If all four violations occurred within an 18-month period, the District may elect to discontinue service of the water supply that has been wasted. If service is discontinued due to AR 1041 violations, the District will charge a reconnection fee of $100 to restore service after abatement of the violation and payment of the fine. Restoration of service may occur without prejudice to any party's position pending appeal under AR 1041.6.

Unpaid fines are subject to the property lien procedure of Water Code section 25806.

AR 1041.6 Appeal and Hearing

A customer may appeal any notice of water waste violation by filing a written request for a hearing with the District's General Counsel within seven calendar days after receiving the notice. The appeal shall identify the property and state the grounds of appeal together with all material facts in support of it. Appeals will be heard by the General Counsel or her or his designee. The filing of a request for hearing shall stay any consequences for violation until the appeal is decided.

When a hearing is requested, the hearing officer shall send written notice to the appellant by certified mail, return receipt requested, stating the time and place of the hearing. Hearing procedures shall be informal, but serve the goals of proper decorum and the pursuit of the truth. At the hearing, the appellant shall have the right to present information as to the alleged facts upon which the notice was issued, and as to any other facts that may aid the hearing officer in determining whether a violation has occurred and, if so, the appropriate consequences.

Within ten calendar days after the close of the hearing, the hearing officer shall issue a written determination either upholding, reversing, or modifying the notice of water waste violation, and briefly stating the reasons that support the determination. Failure to issue a written determination within ten calendar days shall automatically reverse the notice of water waste violation. The hearing officer's written determination shall constitute the District's final action.

El Dorado Irrigation District

AR 1050 State Criminal Laws Protecting Public Water Supplies and Wastewater Systems

Approved: December 12, 2006

In relation to the protection of public water supplies, many offenses are misdemeanors under the laws of California, and offenders may be criminally prosecuted. Such offenses include but are not limited to the following: stealing water, interfering with or damaging water tanks, pump stations, and pipelines; and discharging or depositing substances into the public wastewater system.

AR 1060 Unauthorized Use of Water

Approved: December 12, 2006

No customer may use water on any tract of land not included in his or her application for service. Each parcel must be served by a separate meter.

AR 1070 Unauthorized Regulation of Water or Wastewater Flow

Approved: December 12, 2006

No person except authorized employees of the District is permitted to turn on or turn off water at any connection or to open or close any gate valve or other device that regulates the flow or measurement of water, wastewater, or recycled water.

El Dorado Irrigation District

AR 1080 Resale of Water or Wastewater Service

Approved: December 12, 2006

No retail customer shall enter into any contract or agreement to resell any portion of the water or wastewater service to which he or she is entitled without the specific authorization of the Board.

The owner of a mobile home park, trailer park, apartment building, or other multi-unit structure or development may install a separate meter for each unit and may supply water purchased from the District to occupants of each such unit under the following conditions:

a) the rate charged shall not exceed the commodity rate charged by the District during the same period;

b) the District has the right to examine books and records of the property owner, upon reasonable notice, to ensure that the amount charged does not exceed the limits of these Policies; and

c) the property owner shall comply with all state, federal, and local provisions of law applicable to the sale, distribution, and use of water.

AR 1090 Liability for Maintenance or Damages

Approved: December 12, 2006
Revised: April 1, 2013

The District assumes no responsibility for the delivery of water or disposal of wastewater through private pipelines or for any damage resulting from operation of such pipelines. The property owner is solely responsible for maintenance and repair of water and wastewater lateral pipelines connecting to the District's system. For water lateral pipelines, the connection between the water main and the meter box, including the water meter, are owned and maintained by the District. Wastewater service lateral responsibilities are more fully set forth in AR 6020.

AR 1110 Service Interruptions

Approved: December 12, 2006

The District shall make every reasonable effort to notify customers in advance of any interruption in water supply or wastewater collection, outside of emergency circumstances. However, the District disclaims any liability for damages sustained to customer-owned water or wastewater facilities such as booster pumps, water heaters, or solar equipment. The District also disclaims responsibility for damages to private property, privately owned plumbing and other fixtures that may result from an interruption of water supply or wastewater collection or change in water pressure.

AR 1120 Right of Inspection and Access

Approved: December 12, 2006

Employees and agents of the District shall have unrestricted access to all premises, including private property, as necessary or desirable during such hours and upon such notice as is reasonable under the circumstances, to inspect facilities for the purpose of protecting the District, its customers, and public health and to enforce the provisions of these Policies, as necessary.

AR 1130 Public Access to Customer Records

Approved: December 12, 2006

The names, addresses, and any other data collected by the District regarding customers or property owners within the District, including computerized geographical information and project development files, shall not be available to the public except to the extent required by law.

El Dorado Irrigation District

BP 2000 MANAGEMENT OF THE DISTRICT

BP 2010 Concepts and Roles in District Management

Adopted: December 11, 2006
Supersedes:

The General Manager and General Counsel are appointed by the Board of Directors and serve at the Board's pleasure. The General Manager employs department heads and management personnel to assist in the effective management of the District. All units, departments, programs, and services make up the District's management system and are organized so that appropriate decision-making takes place at various levels in accordance with Board Policies and Administrative Regulations.

AR 2010 Management Functions

Approved: December 12, 2006

District's management function is to:

- provide leadership in enhancing the quality of service provided to District customers and the community;
- ensure employee commitment to a customer-oriented approach in delivering services;
- establish a framework of District responsibility to make sure each department fulfills its role in accomplishing the District's mission;
- establish and implement appropriate budgeting oversight;
- implement and support District programs with the goal of providing high-quality, cost-efficient services;
- effectively manage the day-to-day operations of the District's various departments, programs, and projects;
- respond to local, state, and federal mandates; and
- evaluate procedures, practices, and personnel to ensure the most efficient and effective operation of the District.

AR 2011 Organization Chart/Lines of Responsibility

Approved: December 12, 2006

The General Manager or his/her designee shall maintain up-to-date District organizational charts that clearly designate lines of primary responsibility and the relationships among all District positions.

The organizational charts shall clarify working relationships and functions. They are not intended to indicate all lines of communication and cooperation that must exist to create effective and efficient operation of the District.

Supervisors and managers shall ensure that all personnel understand to whom they are responsible and for what functions.

AR 2012 Staff Organization

Approved: December 12, 2006

The General Manager shall organize District staff in a manner best suited to achieve success, in order to implement Board policies.

The Board directs the General Manager to strive to ensure a respectful, responsive, and resourceful organizational culture that:

- values individuals;
- promotes effective listening and communications skills;
- creates a climate of trust through honesty, openness, fairness, and inclusion;
- responds whenever possible to employee training needs, whether they be organizational, departmental, interdepartmental, or individual;
- provides a collaborative environment to facilitate conflict resolution, improve efficiencies, and accommodate change;
- encourages individuals to solve problems and take prudent risks; and,
- recognizes employees for good work.

AR 2013 Temporary and Part-Time Personnel/Consultants

Approved: December 12, 2006

The General Manager may hire consultants, part-time or temporary employees to assist or advise with the administration and duties of the District, subject to the adopted purchasing practices of the District.

Expenditures of funds for the hiring of consultants shall not exceed the funds budgeted by major categories for such purposes in the annual budget or revisions of the annual budget of the District.

AR 2014 Cell Phone and Smart Phone Allowance and Use

Approved: August 11, 2010
Revised:
Revised:

There is a cell phone and smart phone reimbursement program for District employees who use their personal cell and smart phones for District business purposes. The program recognizes that cell and smart phones enhance District communication, improve employee productivity, and are a key component of the District's communication network during emergencies.

AR 2014.1 Definition of Cell Phone and Smart Phone

A cell (mobile) phone is a long-range, portable electronic device for personal telecommunications. In addition to the standard voice function of a land-line telephone, cell phones can support other services such as short message service for text messaging, email, Internet access, and multimedia message service for sending and receiving photos and video. Most current cell phones connect to a cellular network of base stations, which are in turn interconnected to the public switched telephone network.

A smart phone is any electronic handheld device that integrates the functionality of a cell phone with a personal digital assistant (PDA) or similar information appliance. "Smart" functionality typically includes a miniature keyboard and/or a touch screen, and features may include Internet and email access, scheduling software, contact management, and the ability to read business documents in a variety of formats such as Adobe PDF and Microsoft Office. Connectivity to these features may require the purchase of additional software, which is used to synchronize the smart phone with data such as email and calendars.

In addition to the purchase price of a cell phone or smart phone, these devices require a service or calling plan that defines expected use over a period of time and is paid in monthly installments that vary, but typically include a fixed access charge and air time and data charges.

AR 2014.2 Scope

The program applies to all District employees.

AR 2014.3 Program

Under current government regulations, all personal use of and any reimbursement for personal use of District-owned or provided cell phones must be treated as taxable income. Administration of the program will be conducted in accordance with Standard Operating Procedure *Establishment and Payment of Cell Phone* *and Smart Phone Allowance* or its successor. Program administration is cross-functional and assigns responsibilities as follows:

The General Manager will determine the amount of each type of allowance and adjust periodically as required.

The Director of Information Technology will recommend the cost estimates to set the allowance amounts for approval by the General Manager.

The Director of Human Resources will administer program allowance payments to approved employees through the Payroll process.

The Director of Finance will administer the payment of approved reimbursements through the Accounts Payable process.

Each Department Director will determine the need for an employee to receive an allowance and review their employee's ongoing program participation on an annual basis or other suitable frequency as determined by District business needs.

Four approaches for the use and payment of cell phones and related costs are authorized. An employee may be authorized for one approach. Options B and C below provide an allowance for business use of an employee provided cell phone and fall under IRS Regulation 1.62(c) as a non-taxable business expense reimbursement.

A. District-Owned Phones
The cell and smart phones should be purchased, maintained, and supported through cost allocation to the department where the employee is assigned if the cell phone is used for 100% District business, including all incoming and outgoing calls and/or data usage, and no personal use (with the exception of life safety situations).

The IT Department will perform the following controls on District-owned cell and smart phones.
As required

- Manage user addition, change, and disconnect requests as well as service plans and features with the cellular carrier; maintain the authorized inventory.
  Monthly
  • Validate summary bills and sub-accounts against the authorized inventory of District-owned devices, phone numbers, service plans, and features.
  • Analyze summary fixed access charges, air time charges, data charges, and other charges and credits.

Annually

• Coordinate collection of requirements, address any needed changes, and update related documentation.

• Analyze requirements and recommend standard devices, a service provider, and service plans that provide the best value to the District.

Supervisors will perform the following controls for District-owned cell and smart phones used in their groups.

As required

• In all instances of shared device use, maintain a log—including the assigned user and the time and date of possession of the device—to ensure accountability.

• Review and approve requests to add, modify, or remove District-owned cellular devices and services prior to submitting to the IT Department for action.

Monthly

• Review cell phone invoices for appropriate and applicable use.

Department directors will perform the following controls for District-owned cell and smart phones used in their departments.

Annually

• Review the continuing need for an employee to receive a District-provided device, based on District business need.

B. Employee-Owned Smart Phones

If the smart phone is used for a mix of District and personal use, the employee may request department head approval for an allowance, which will be used to offset the costs incurred by the owner of the phone, including the data plan. The employee is responsible for all costs incurred.

The IT Department will perform the following controls on authorized employee-owned smart phones that comply with published District standards.

As required

• Manage the addition, change, and disconnect requests to the District email system.

• Program the phone so that it can securely and reliably access District mobile device services. This may include the installation of additional software to secure data should the device be lost, stolen, or broken.

• Attempt to secure the data within four business hours on a smart phone reported lost, stolen, or broken. Current technologies do not guarantee that all data can be secured if the device is lost, stolen, or broken.

Annually

- Analyze requirements for employee-owned smart phones and specify standards that provide the best value to the District.

Supervisors will perform the following controls for employee-owned smart phones used in their groups.
As required
- Review and approve requests to add, modify, or remove employees to the smart phone allowance program based on business needs.

Department directors will perform the following controls for employee-owned smart phones used in their departments.
Annually
- Review the continuing need for an employee to receive an allowance based on District business needs.

C. Employee-Owned Cell Phones
If the cell phone is used for a mix of District-business and personal use, the employee may request department director approval for an allowance, which will be used to offset the costs incurred by the employee. The employee is responsible for all costs incurred.

Supervisors will perform the following controls for employee-owned cell phones used in their groups.
As required
- Review and approve requests to add, modify, or remove employees to the cell phone allowance program based on business needs.

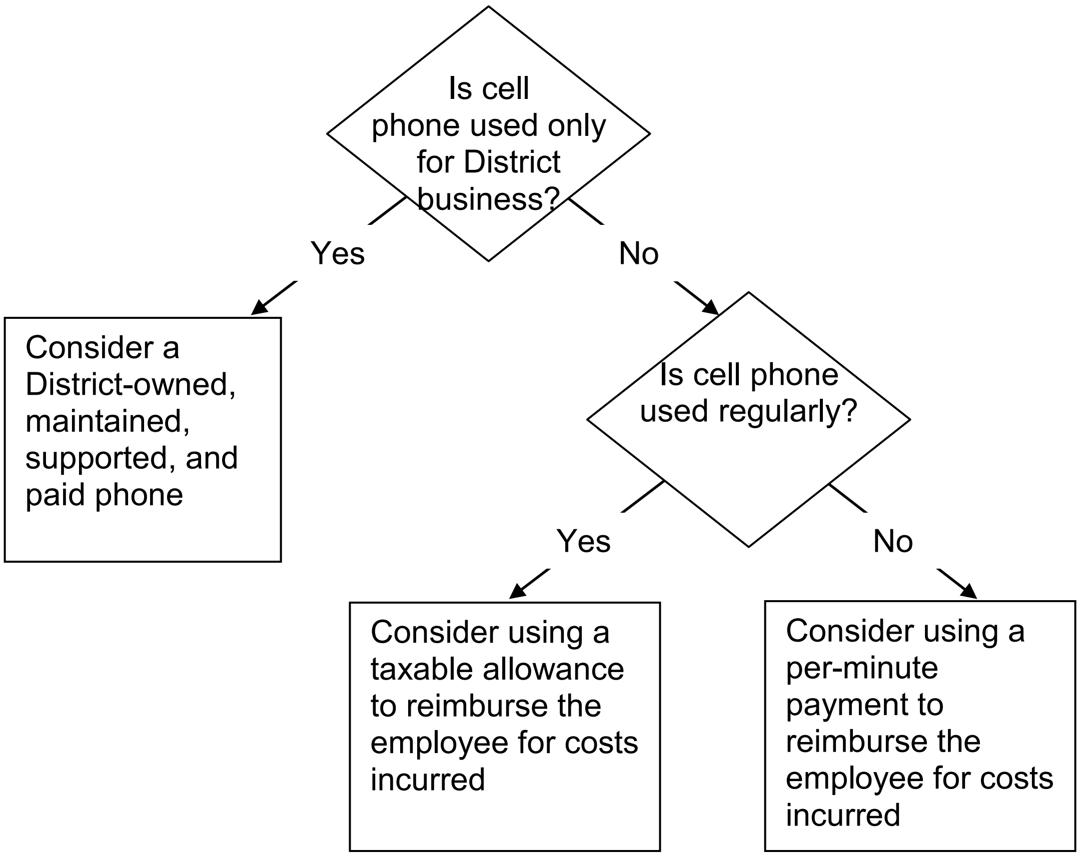
Department directors will perform the following controls for employee-owned cell phones used in their departments.
Annually
- Review the continuing need for an employee to receive an allowance based on District business needs.

D. Incidental Use of Personal Cell Phones
For employees required to use their personal cell phone for unplanned District business, a per-minute payment is authorized. The employee must request the reimbursement through the District's expense statement process.

Supervisors will perform the following controls for incidental use of employee-owned cell phones used in their groups.
As required
- Review and approve requests to reimburse employees for incidental use of employee-owned cell phones based on business needs.

AR 2014.4 Cell Phone Allowance Decision Guideline

This decision guideline is intended to aid the reader in selecting the most appropriate program approach.



AR 2015 Personal and Private Internet Service Use and Reimbursement

Approved: August 11, 2010
Revised: July 14, 2014

This administrative regulation establishes guidelines for the use of personal computers and/or personal or private internet services to conduct District business through secure remote access over the internet. The District recognizes that this practice can enhance employee productivity and the delivery of system support services. The regulation also establishes conditions under which employees may be reimbursed for the use of their personal computer and/or personal or private internet services. The regulation is not intended to alter the District’s practice of providing computer workstations for employee use or cellular internet service on District workstations for those employees who routinely and frequently work in the field and have a business need for secure remote access to District information systems.

AR 2015.1 Definitions

Personal Computer – A personal computer is a general purpose computer whose size, cost, capabilities, and features make it useful for individuals, and which is intended to be operated directly by an end-user with no intervening computer operator. A personal computer may be a desktop computer or a laptop, netbook, tablet or a handheld model, and is not equipped by the manufacturer with the features or functionality intended to make it suitable to serve as the end-user’s mobile phone. Software applications for most personal computers include, but are not limited to, word processing, spreadsheets, databases, web browsers and e-mail clients, digital media playback, and myriad personal productivity and special-purpose software applications. Personal computers typically have connections to the internet, allowing access to a wide range of other resources. Personal computers may be connected to a network, either by a cable or a wireless connection.

Personal and Private Internet Service – A personal internet service uses an Internet service provider (ISP) company to gain access to the internet for personal use with no expectation of resale. Personal internet services are typically found in residences and in some public areas. A private internet service is generally a reseller of ISP services at a facility such as a hotel or conference center where the operator can authorize only specific users to access the Internet for a limited time on a fee basis, such as per day or per hour. Either type of service connects its users or customers to the World Wide Web using a wired or wireless access point.

Full-time Telecommuter – An employee with job duties that require the employee to work from a home office four or more days per week on a recurring basis. Job titles currently authorized as full time telecommuters under this program are Board members, who are expected to complete the vast majority of their District-related job functions through remote access and do not maintain individual offices in District facilities. The procedures for Board members obtaining reimbursement are set forth in AR 12065.

AR 2015.2 Scope

The program applies to all District employees.

AR 2015.3 Program

The District treats the reimbursement of an expense incurred while peforming services for the district as non-taxable income. The following approaches for the use and potential payment of costs related to personal computer and/or personal or private internet are authorized. One or more of these approaches may apply to an employee at a time.

A. Use While Fulfilling Standby or Support Duties

Employees expected to fulfill standby or support duties are provided with a District-owned computer appropriately configured and secured for this purpose. No use of a non-District personal computer is permitted for fulfilling standby or support duties. No reimbursement is authorized for occasional or potential use of personal or private internet service used to conduct District-related activities for employees where secure remote access to District information systems has been provided as a tool by their supervisor. Providing employees with secure remote access via the internet to various business applications and information sources is viewed by the District as a convenience, not a requirement. When remote access is not authorized, feasible, available, or possible, employees must report in person to the job site to attend to their job duties.

B. Use While Traveling on District Business

Employees who expect they will need remote access services when traveling on District business should make arrangements at least three business days in advance with the IT Department to acquire a temporary District-owned computer if necessary and/or temporary cellular internet service for the duration of the business trip. If such arrangements are not possible, a reimbursement payment is authorized for the cost of using a private internet service.

C. Incidental Mobile Internet Use

No reimbursement is authorized for employees that use their personal internet service on a smart phone or similar mobile device for District business if the employee has not been authorized for the Smart Phone Allowance under the Cell Phone and Smart Phone Allowance and Use program. See AR 2014.3 for additional provisions of this program.

D. Full-time Telecommuting Use

Employees who are required to use their personal computer for District business on a near full-time basis are eligible to receive a payment for the actual cost of the computer and certain related items:

- Reimbursement for the purchase price of a single personal computer and extended warranty, up to a maximum of $1,000 no more than one time every four years.
- Reimbursement for the purchase price of software applications required to effectively and securely perform District duties.

Not eligible for reimbursement are any other costs associated with personal computer ownership, including diagnostic and repair services, software and equipment maintenance, training, data backup and recovery, peripheral devices and accessories.

Employees who are required to use their personal internet service for District business on a near full-time basis will receive a payment for the actual cost of the service, up to a maximum of $40 per month.

BP 2020 Role of the General Manager

Adopted: December 11, 2006
Supersedes:

The success of the District depends upon the ability of individuals and groups to adapt to the changing needs of the District and its customers in effectively carrying out the Board's direction. The General Manager shall establish and maintain a standard of respect, ethical behavior, responsiveness, and resourcefulness for District managers and staff to:

- work cooperatively to identify District, customer, and community needs;
- motivate, challenge, and guide others in providing high-quality, cost-efficient services;
- continuously evaluate the effectiveness and quality of the services provided;
- be knowledgeable about District policies and procedures, negotiated agreements, and past practices;
- keep the Board and public informed on the status of the District and make recommendations for changes and improvements that will promote the continued success of the District;
- keep the Board informed on decisions that significantly impact the operations of the District;
- inform the Board on industry developments that have a bearing on the duties or policies of the Board;
- conduct strategic planning and make appropriate recommendations for the future;
- employ a professional staff to assist in carrying out Board Policies;

- offer professional leadership through ongoing program improvements;

- develop and administer regulations and procedures to govern employer-employee relations under state and federal statutes;

- enter into contracts as necessary to perform the functions of the District; and

- comply with all the duties and responsibilities set forth by state and federal law.

BP 2030 Role of the General Counsel

Adopted: December 11, 2006
Supersedes:

The General Counsel shall be attorney for the District, acting by and through its Board of Directors, management, employees, and agents. The General Counsel shall be responsible for:

- providing high-quality, cost-efficient legal services to the District and all District personnel acting within the scope of their employment;
- securing and managing the services of outside counsel to provide specialized knowledge or avoid potential conflicting attorney roles;
- ensuring full compliance with applicable laws and regulations in all District activities;
- proactive counseling and representing the District, the Board, the General Manager and the departments in transactions and events involving District interests;
- representing the District in litigation; and
- ethical behavior.

BP 2040 Formulation and Enforcement of Administrative Regulations

Adopted: December 11, 2006
Supersedes:

The General Manager, in cooperation with the General Counsel, shall establish and amend as necessary or desirable, Administrative Regulations to implement Board policies and bylaws according to law.

Administrative Regulations shall be effective immediately upon adoption by the General Manager and General Counsel. Adopted Administrative Regulations shall be provided to the Board. The General Manager and/or General Counsel have the authority to interpret all Administrative Regulations and to rule on any point of contention that is not specifically covered therein.

BP 2050 Administrative Leeway in the Absence of Policy

Adopted: December 11, 2006
Supersedes:

While the Board Policies and Administrative Regulations are intended to be inclusive, in the absence of a policy or regulation, all employees are directed to act reasonably and in good faith based on the mission and goals of the District. Likewise, the General Manager shall have the power to act in emergency situations where no Board Policies or Administrative Regulations exist.

BP 2060 Conflict of Interest

Adopted: December 11, 2006
Supersedes:

The General Manager and the Board of Directors shall adopt and promulgate a Conflict of Interest Code in compliance with the Political Reform Act, Government Code section 81000, et seq.

Copies of the Conflict of Interest Code can be obtained from the Office of the General Counsel.

El Dorado Irrigation District

BP 3000 DISTRICT BUSINESS OPERATIONS

BP 3010 Budget

Adopted: September 11, 2006
Supersedes: N/A

The Board is committed to promoting the most efficient and effective use of the District's financial resources that will accomplish the goals of the District, support facilities and programs, and provide quality services to District customers. It is the responsibility of the General Manager to inform the Board about financial operations of the District so the Board can make informed decisions and fully discharge its legal responsibilities in a fiscally sound manner.

The Board shall adopt a two-year operating budget and may modify it prior to the end of the year. The Board shall also adopt every year a five-year Capital Improvement Plan and approve funding on an as-required basis.

AR 3011 Budget Development

Approved: December 12, 2006
Revised: November 4, 2010

It is the responsibility of the General Manager to develop the budget based on the priorities and needs of the District and its customers. The budget and any budget modification shall:

1. include, but not be limited to, operating expenses, debt, construction, and reserve funds;
2. meet all legal requirements;
3. support the District's mission;
4. maintain prudent levels of reserves in water, wastewater, hydroelectric, and recreation to fund contingencies that meet the District's debt service requirements;
5. allow the District to meets its financial obligations, including bond covenants;including the annual allocation of property taxes between water and wastewater operating funds;
6. be consistent with a financial plan that guides the District in satisfying its multi-year commitments; and
7. encourage public participation through required disclosures and public hearings.

Responsibility for overseeing the budget development process is assigned to the department head for Finance and Management Services, who will work directly with each department head or manager in drafting the budget. Once the annual budget is prepared, the Board shall act on it.

Timing for preparation and presentation of the annual budget and the five-year Capital Improvement Plan is as follows:

The five-year Capital Improvement Plan will be presented in a workshop for the Board in September or October of each year. The five-year plan will then be presented to and adopted by the Board no later than the end of November of any given year.

The budget will be presented in a workshop for the Board in November on or after the five-year Capital Improvement Plan is adopted. The budget then will be presented and adopted by the Board prior to the end of the calendar year.

Following budget adoption, the department head for Finance and Management Services shall exercise supervision over the finances of the District in keeping with regular budgetary procedures.

Finance Manager shall bring to the Board any modification to the adopted property tax allocation between the water and wastewater operating funds in order to meet the anticipated debt coverage requirements for those separate utilities.

AR 3012 Budget Management and Five-Year Financial Plan

Approved: December 12, 2006
Revised: November 4, 2014

The General Manager desires to maximize efficiency in the management of revenue and expenditures and thereby assigns responsibility for monitoring program budgets to department heads and program managers who shall use financial reports, program reports, and other pertinent data to ensure maximum effectiveness of program operation.

Purpose of the Five-Year Financial Plan
The Five-Year Financial Plan establishes the cost of funding the operations and maintenance, capital expenditures, and debt expenses required to meet the District's mission of providing high quality, wastewater treatment, recycled water, hydro-power, and recreational services in an environmentally and fiscally responsible manner, meeting the District's debt covenant requirements to its bond holders and matching future revenues to those costs.

Long-term financial planning:
- Avoids volatile rate adjustments;
- Better manages debt;
- Better manages prepayment of debt;
- Funds the Capital Improvement Plan;
- Provides a plan for meeting debt covenant requirements; and
- Sets clear, public goals and expectations.

Goals and Objectives of the Financial Plan
The goals and objectives are to:
- Establish necessary operating and maintenance costs, debt expenses, and pay- as-you-go project costs;
- Generate adequate revenues to fund those costs, meet debt covenants, and maintain adequate cash reserves;
- Avoid "rate shock" – small annual rate adjustments are better than years of zero rate increases followed by double-digit increases to make up shortfalls;
- Maintain strong credit ratings with rating agencies (S&P – A+, Moody's – A1);
- Maintain cash reserves between $60 million and $80 million;
- Maintain CIP funding levels to replace high priority capital assets prior to end of life, avoiding critical asset failures;
- Maintain 1.7 to 2.0 debt coverage ratio with Facility Capacity Charges (FCC); and
- Maintain 1.25 debt coverage ratio without FCC's – in all years, meet Finance Control test that annual operating revenue, excluding FCC's, must equal or exceed total annual operating expenses plus debt payments.

El Dorado Irrigation District

AR 3013 Appropriation for Contingencies

Approved: December 12, 2006

Fund balances that are budgeted for contingencies may be transferred to an expenditure appropriation as needed, upon authorization of the responsible department head or program manager.

AR 3014 Reserves

Approved: December 12, 2006

The District will maintain operating reserves, as approved by the board, in each of its fund types including: water, wastewater, hydroelectric, and recreation funds, as a credit enhancement and to provide for:

- economic uncertainties, local disasters, and other financial hardships or downturns in the local, regional, state, or national economies;
- contingencies for unseen operating and capital needs;
- funding for planned remedial, replacement, or renovation of existing facilities;
- cash-flow requirements; and
- a revenue source for invested interest earnings to reduce District needs for ratepayer funds.

AR 3015 Financial Control Test

Approved: August 22, 2012

The projected annual revenues of every adopted District operating budget, excluding Facility Capacity Charges, must equal or exceed the projected annual operating expenses plus debt payments.

BP 3020 Revisions to the Budget

Adopted: September 11, 2006
Supersedes: N/A

After approval of the District's budget, any revision to it shall require the approval of the Board. The General Manager shall bring to the Board's attention any budget revisions that may be necessary because of increased expenditures due to law, regulation, changes in demand for services, price increases, or any other external factors.

BP 3030 General Manager’s Reporting Responsibilities

Adopted: September 11, 2006
Supersedes: N/A

The General Manager shall submit quarterly financial status reports during the fiscal year to the Board. All reports should show whether the District is meeting its financial obligations and include a forecast for the remainder of the current fiscal year.

BP 3040 Annual Audit

Adopted: September 11, 2006
Supersedes: N/A

An annual audit of the District's fiscal operations will be conducted by an independent certified public accountant or certified public accountant firm with knowledge and experience in public agency accounting. An audit report shall be prepared by the auditor.

The independent certified public accountant firm shall be contracted for three years with an option for a two year extension, requiring Board approval.

Government Code section 26909 requires government agencies to undergo periodic external financial reviews. The Board will review and receive the annual audit report within 180 days after the end of the fiscal year.

BP 3050 Financial Condition and Activities

Adopted: September 11, 2006
Supersedes: N/A

The District will be run in a fiscally responsible and prudent manner according to the principles of AR 3051.

El Dorado Irrigation District

AR 3051 Budget Principles

Approved: December 12, 2006
Revised: October 16, 2012

The General Manager shall ensure that the District is run in a fiscally responsible and prudent manner so that:

1. Expenses do not exceed funds that have been received in the budget period to date unless those funds are specifically appropriated for designated reserves or available from the proceeds of authorized short or long-term debt.
2. Indebtedness, except as provided in the Irrigation District Act, shall not exceed an amount greater than can be repaid by certain, otherwise unencumbered revenues within 90 days or prior to the close of the fiscal year.
3. Unappropriated, long-term reserves or undesignated fund balances are not used.
4. Unbudgeted inter-fund transfers are not conducted in any amount greater than can be repaid by certain, otherwise unencumbered revenues within 90 days or prior to the close of the fiscal year without Board approval.
5. Payroll and debts are settled in a timely manner.
6. Tax payments or other government ordered payments or filings are not allowed to be overdue or inaccurately filed.
7. Receivables are pursued after a reasonable grace period in a timely and business-like manner.
8. Operation of the District includes written contracting and purchasing administrative regulations and a procurement manual that address normally prudent protections to assure legal and fiscal compliance against non-competitive acquisition practices, conflict of interest, favoritism, and non-inclusive supplier policies.
9. In the expenditure of public funds, the District shall comply with Article 16, section 6, of the California Constitution.

AR 3052 Employee Expense and Reimbursement

Approved: January 14, 2011

Scope

This Administrative Regulation applies to all District employees, other than the Board of Directors, who incur expenses in the conduct of District business. Board expenses and reimbursement are governed by BP 12065 and AR 12065.

This Administrative Regulation also makes narrowly limited provisions for payment or reimbursement of expenses of other personnel from other agencies and the public as specifically provided below.

General Principles

The following general principles govern all employee requests for and all District payment or reimbursement of expenses.

- District employees shall not profit by or experience a financial loss by incurring travel and other expenses while conducting authorized District business.

- District employees compelled to travel or incur other expense in the performance of their duties for the District shall have their expenses for registration, lodging, transportation, meals, incidentals, and other costs paid or reimbursed, provided those expenses were actually and necessarily incurred and are reasonable in amount, and subject to the maximum limits established by this Administrative Regulation for lodging, meals, and private automobile use.

- The District will not pay or reimburse any costs for alcoholic beverages, or for any expenses incurred on behalf of an employee's spouse or family member who accompanies the employee.

- Travel arrangements should be as economical as practical considering the travel purpose, traveler, the time available to accomplish the travel, available transportation and facilities, and time away from other job duties. Common carrier travel shall be in "coach," "economy," or equivalent class. Rental cars shall be economy or equivalent class unless weather, road conditions, or job duties necessitate otherwise.

- When the sponsor of a training, conference, meeting, or seminar offers discounted lodging, employees seeking District payment or reimbursement of lodging expenses shall utilize the discounted lodging if space is available. Subject to this rule, lodging should be booked whenever possible at establishments that waive transient occupancy taxes for government agencies.

- Employees opting to use private automobiles for District business are responsible for ensuring that the vehicle is in sound and safe operating condition. They must possess a valid driver's license and have current auto insurance documentation on file with the District as required by the Employee Handbook.

- Participants for any travel requiring expense reimbursement should ordinarily be limited to no more than two staff members, who will be responsible for sharing information with other interested parties upon return. A department head or the General Manager may authorize more participants if he or she determines that the travel involves training or meetings of sufficient technical content or breadth that more widespread participation is warranted.

- Employees seeking payment or reimbursement must obtain prior authorization for expenses or travel as provided herein before incurring the expenses and commencing travel.

- No expense is payable or reimbursable unless it is consistent with the intent of this Administrative Regulation.

- The General Manager may, in his or her sole discretion, authorize one-time exceptions to any requirement of this Administrative Regulation, based on good cause shown by the responsible department head. Exceptions will be made only in the interests of fairness and to further the intent of this Administrative Regulation.

<u>Procedures</u>

The following procedures apply to all expense payments and reimbursements.

- Requests for travel authorization and expense payment or reimbursement shall be processed using forms as specified by the Finance Director. Forms shall require written approval from, at minimum, the employee's supervisor and department head, and the Finance Director or his or her designee. Approval should be obtained in advance, whenever feasible.

    - Requests for travel authorization should be submitted at least 30 days prior to travel, whenever feasible, to allow appropriate consideration and to minimize costs.
    - Expense statements and all required substantiation should be submitted not more than 10 business days after the expense is incurred or the travel is completed, whichever is later.

- The Finance Director may, in his or her reasonable discretion, decline to process documentation that does not meet these timelines, does not comply with this Administrative Regulation, is inaccurate, or is incomplete.

- Invoices, published rates, or other comparable documentation are required for pre-payment or cash advances for registration fees, lodging costs, transportation costs, and other authorized expenses.

- Receipts are required for reimbursement of registration fees, lodging costs, transportation costs, meal costs, daily incidental expenses greater than $10.00, and other authorized expenses. Receipts shall be itemized whenever feasible, and appropriately annotated by the requesting party in all instances.

- Incidental expenses, defined as tips, toll charges, transportation costs, parking fees, snow chain installation and removal charges, and similar expenses, are reimbursable without receipts up to a combined maximum of $10.00 per day.

- Payment or reimbursement of certain expenses is limited as follows:

    - ***Lodging*** – On a daily basis, not more than three times the then-current per diem hotel rate provided for the locality under the federal per diem method in the United States Internal Revenue Service's Publication 1542. In-room entertainment fees, spa fees, and similar ancillary services are not lodging expenses and are not authorized for payment or reimbursement.
    - ***Private automobile transportation*** – On a per-mile basis, the United States Internal Revenue Service's then-current federal rate. Mileage for travel shall be computed from the employee's designated work location, except that if travel begins from the employee's residence, mileage shall be calculated from the residence or designated work location, whichever is less.
    - ***Long-distance automobile transportation*** – Employees should not use a District or private automobile for travel more than a five (5) hour, one-way driving distance from the District offices. Any exception to this rule must receive prior approval from the employee's department head. If air travel would be more economical, but the employee is allowed to travel by automobile, the District will pay reimburse transportation costs incurred up to the amount of the air travel cost. The District will not pay or reimburse any transportation costs in excess of that amount, nor any extra days of lodging, meals and other expenses.
    - ***Meals*** – For breakfast, not more than $15.00, including tip; for lunch, not more than $20.00, including tip; for dinner, not more than $35.00, including tip. Subject to these limits, tips of up to 15% of the meal cost are eligible for payment or reimbursement. Except when meals are approved as part of a program for training, meetings, conferences, or

seminars, breakfast expenses are authorized only if an employee's travel extends at least two hours before the employee's regular work hours begin and dinner expenses are authorized only if an employee's travel extends at least two hours after the employee's regular work hours end. The District will not pay or reimburse any additional or other expenses for meals that are already included in the registration fee for a training, meeting, conference, or seminar. There are no per-diem payments for meals.

- Payment or reimbursement of expenses for non-District employees is prohibited, except as follows:

  - Meal costs for the subject of a job interview or a person participating on a job interview panel, when deemed appropriate by the Human Resources Director.
  - Meal costs for representatives of other governmental agencies, community organizations, or private interests, when the meal is attended by one or more District employees, the meal directly and substantially facilitates the conduct of District business, and the expense is authorized by the employee's department head. Due to the potential for abuse, it is the express intent of this regulation that District department heads construe and apply this exception narrowly and only when the District's best interests are clearly served by invoking it.

- District employees may request and receive cash advances of no less than $50.00 and no more than 75% of non-prepaid, authorized expenses. Cash advances will be reconciled against actual expenses at the conclusion of travel. The employee shall refund the District within 2 business days of returning to work for any excess of advanced funds over non-prepaid, authorized expenses actually incurred.

Additional or Overtime Compensation

Overtime or additional compensation for attendance or travel time involved with seminars, conferences, or training sessions for employees will be compensated in accordance with then-current Fair Labor Standards Act guidelines. Employees and supervisors should consult with the Human Resources Department for guidance.

BP 3055 Disposition of Personal Property

Adopted: September 11, 2006
Supersedes: Purchasing Policies and Procedures Manual adopted 11/25/91, revised 2/27/95, revised 7/19/99

The District will dispose of surplus property in a fiscally responsible manner according to the adopted administrative regulations.

El Dorado Irrigation District

AR 3055 Disposition of Personal Property

Approved: December 12, 2006

AR 3055.1 Disposition of personal property valued at $50,000 or more

Disposition of personal property valued at $50,000 or more will be made only after approval of the Board of Directors.

AR 3055.2 Disposition of personal property valued between $5,000 and $50,000

Disposition of personal property valued between $5,000 and $50,000 will be made only after approval of the General Manager, who will report all such dispositions to the Board of Directors on a quarterly basis.

AR 3055.3 Disposition of personal property valued at less than $5,000

Disposition of personal property valued less than $5,000 shall be made by the District Services Administrator as approved by the department head for Finance and Management Services, who will report all such dispositions to the General Manager on a quarterly basis.

AR 3055.4 Restrictions on employee purchases

District employees shall not purchase District property unless such property is disposed of through a third party such as a contract auctioneer.

BP 3060 Contracts and Procurement

Adopted: September 11, 2006
Supersedes: Purchasing Policies and Procedures Manual adopted 11/25/91, revised 2/27/95, revised 7/19/99
Revised: August 13, 2012

The District shall adopt procurement and contracting procedures by administrative regulations. Such procedures shall be designed to provide a fair, open, and competitive process that avoids conflicts of interest, collusion, and favoritism.

Prior to approving a contract or procurement with any outside entity, the District shall first obtain bids when required by law or when beneficial to the District. If bids are not required by law and the General Manager does not opt to use the bidding process, goods and services shall be at the lowest price consistent with desired quality or which is in the best interests of the District.

The Board of Directors hereby delegates to the General Manager the authority to approve contracts and procurements with values of up to and including $50,000, and construction contract change orders of up to and including $100,000. Except during emergencies, the Board of Directors shall approve all contracts or procurements with values greater than $50,000, and construction contract change orders with values greater than $100,000.

In the event of an emergency requiring immediate contract or procurement action, the General Manager is hereby authorized to approve any and all contracts necessary to abate the emergency after first informing the President of the Board of Directors and scheduling an emergency meeting of the Board of Directors at the earliest possible opportunity. The General Manager shall bring any and all contracts or procurements with values exceeding the levels set forth above, but approved during an emergency, to the Board of Directors for ratification at the first meeting of the Board immediately following the emergency.

AR 3061 Procurement and Contracts

Approved: December 12, 2006
Revised: October 22, 2008
October 16, 2012
February 14, 2013

AR 3061.01 Purpose

This administrative regulation seeks to establish efficient, equitable, and uniform procedures for all District contracting for goods (including, without limitation, materials and equipment), services (professional and other), rentals and leases of personal property, and construction; provide for fair and equitable treatment by the District of all persons involved in the contracting process; maximize the purchasing value of public funds; exercise financial control over the District expenditures it covers; clearly define authority for spending approvals and contracting functions; and provide safeguards for maintaining a high-quality procurement system.

AR 3061.02 Procurement and Contract Administration

The District's General Services Supervisor, who shall be the District's Purchasing Agent, will implement and administer standard operating procedures for District contracting in consultation with the District's Office of the General Counsel, to implement the purpose and requirements of these administrative regulations.

The District shall conduct all contracting for goods, services, rentals and leases of personal property, and construction in accordance with these administrative regulations and associated standard operating procedures, and under the administration of the Purchasing Agent.

AR 3061.03 Appropriated Funds

The District shall procure only items and services for which the Board of Directors has appropriated funds.

AR 3061.04 Procurement and Contract Authority

Except as otherwise provided herein, and subject to the ultimate authority and direction of the Board of Directors, General Manager, and General Counsel, the District shall not purchase or contract for goods, services, rentals and leases of personal property, or construction without the approval of the Purchasing Agent. The Purchasing Agent may delegate (or withdraw), in writing, responsibility to approve such transactions to others for a designated term. In addition to the approval of the Purchasing Agent, all contracts and procurements must be approved as follows:

a. A single contract or commitment shall not exceed $50,000 without approval by the Board of Directors. All other contracts or commitments require the following spending approval.

   1. Up to and including $50,000 - General Manager
   2. Up to and including $25,000 - Department Director
   3. Up to and including $10,000 - Division Manager
   4. Up to and including $5,000- Supervisor, or employee who has been pre-approved in writing by his/her department director at the recommendation of his/her division manager for such spending approval authority.

b. Where a single contract or commitment that was originally approved for less than or equal to $50,000, requires a change order that increases it to more than $50,000, the change order shall be submitted to the Board of Directors for approval.

c. Under the direction of the Purchasing Agent and the General Counsel, the District shall adopt and maintain standard forms, which the District shall use for all contracts and procurements, unless the use of such standard forms is infeasible or otherwise not in the District's best interests.

d. The Purchasing Agent shall ensure that District procurements are not artificially divided to avoid the approval requirements set forth herein.

AR 3061.05 Solicitation of Bids and Proposals

Except as otherwise provided herein, and subject to the ultimate authority and direction of the Board of Directors, General Manager, and General Counsel, responsibility for the solicitation of bids and proposals resides in the Purchasing Agent. The Purchasing Agent may delegate (or withdraw), in writing, solicitation responsibility. All solicitations should adhere to the following guidelines:

a. <u>Formal Solicitation of Sealed Bids and Proposals</u>: Except as authorized herein or by statute and/or action of the Board of Directors, the District shall solicit contracts or procurements over $50,000 by issuing a formal Request for Bids (RFB) or Request for Proposals (RFP) with written bidding instructions; the criteria for contract award; bid protest procedures; contract terms and conditions; plans and specifications (for RFBs); insurance and bonding requirements, published notice, or other means of advertisement, each as required by law or deemed necessary to promote competition and protect or further the District's interests; and all other information required by law.

Notwithstanding any provision contained herein, the District shall comply with all laws and regulations concerning solicitation, bid, and award procedures for the construction of public works projects regardless of the size of the project or amount of the contract.

When required by law, the District shall award all contracts solicited under this subsection to the lowest responsive responsible bidder. The District shall award all other contracts to the proposer whose proposal is in the District's best interests. In circumstances in which the District formally solicits bids or proposals and receives only one responsive bid or proposal, the District may negotiate with and award the contract to the sole bidder/proposer.

b. Informal Solicitations: The District shall solicit contracts and procurements, except those for the construction of public works projects, of $50,000 or less as follows:

1. $15,000.01 to $50,000 – Three (3) documented quotes or proposals.
2. $5,000.01 to $15,000 –Two (2) documented quotes or proposals.
3. Goods or services procurements under $5,000 shall not require competitive solicitation.
4. The above thresholds include taxes, fees and freight.
5. The Purchasing Agent may request additional bids or proposals.
6, The District may re-use unchanged awards for one year following acceptance.

c. Request for Qualifications: The District may use a Request for Qualification (RFQ) procedure to acquire the services of certain professionals that require extended analysis, the exercise of discretion, independent judgment, and an advanced, specialized type of knowledge, expertise, or training customarily acquired either by a prolonged course of study or equivalent experience in the field. The District may utilize the RFQ procedure for single procurements, or for establishing an on-call list of professional services providers capable and qualified to conduct certain types of services. No contract for the services of legal counsel may be awarded without the approval of the District's General Counsel. Procedures for the selection of architect, engineer, and land surveying services shall be in accordance with state law.

d. Procurements Subject only to Purchasing Agent Determination: For certain procurements, it is impractical to implement competition in the solicitation process. Accordingly, the Purchasing Agent shall maintain a standard operating procedure listing the types of procurements that generally do not require competition other than at the direction of the

Purchasing Agent upon reviewing a specific procurement request. The listing can be changed only by approval of the General Manager and General Counsel upon the recommendation of the Purchasing Agent.

e. Authorization for the Procurement of Goods or Services from a Single Source: Notwithstanding anything herein, for good cause documented in writing and approved by Purchasing Agent and an executive manager with sufficient spending authority, the District may negotiate with a single source for the procurement of goods or services, including construction services when authorized by law. Good cause for single-sourcing may include, for example, when there is only one available source for a necessary good or service, the General Manager has authorized standardization of goods or services pursuant to Section 3061.09, a prospective consultant or vendor possesses unique skills and expertise necessary for a particular procurement, or emergency or extraordinary circumstances require immediate action that cannot be delayed for obtaining bids or proposals.

f. Prequalification of Bidders: The Purchasing Agent may, at his/her discretion, pre-qualify bidders for public works construction contracts. Pre-qualification of bidders will be conducted in accordance with the legal requirements for contractor pre-qualification.

AR 3061.06 Protests

The District shall adopt and maintain a protest procedure for protests of the solicitation and award of contracts, and include a description of the protest procedure in solicitation documents. Any actual or prospective bidder, proposer, or contractor who is aggrieved in connection with the solicitation of a bid or proposal, or the award of a contract on which he/she bid or proposed, may file a written protest in the manner prescribed in the solicitation documents.

AR 3061.07 Piggyback Procurements

The Purchasing Agent may arrange for the District to enter purchase contracts with a supplier for the purchase of goods or services when the pricing and terms have been previously established by another local, state, or federal, public entity, or an association of public entities, provided:

a. the resulting contract with the supplier of goods or services is the result of competitive bidding or negotiation and is made in compliance with the competitive bid or proposal requirements of the participating entity or association;
b. the purchase is made within the longer of one year of the competitive bid or negotiation, or the original contract term or subsequent extension(s);
c. the purchase conforms to the District's specifications for the goods or services; and

d. the purchase is of equal or better value to the District than if made directly by the District.

AR 3061.08 Cooperative Procurements

The Purchasing Agent may arrange for the District to enter an agreement with one or more local, state, or federal public entity, or association of public entities to procure goods or services cooperatively, provided:

a. the resulting contract with the supplier of goods or services is the result of competitive bidding or negotiation and is made in compliance with the competitive bid or proposal requirements of the participating entity or association;
b. the contract conforms to the District's specifications for the goods or service; and
c. the purchase is of equal or better value to the District than if made directly by the District.

AR 3061.09 Standardization of Goods and Services

Upon recommendation of the Purchasing Agent, the General Manager may authorize the uniform adoption or other standardization of a good or service to promote efficiency or for other good cause when the good or service is designated to match others in use, or planned to be used, by the District. All standardizations shall be valid for a term up to three years, which term may be extended one time up to three additional years by the Purchasing Agent after examining market conditions and upon a determination by the Purchasing Agent that the standardization still serves the District's best interests.

AR 3061.10 Contract Documents and Records

Standardized contracting documents will be developed and provided by the Purchasing Agent in consultation with the District's Office of the General Counsel. Non-standard (vendor agreements) are not authorized for use unless approved by the Purchasing Agent after consulting with the Office of General Counsel. District staff not supervised by the Purchasing Agent, operating under delegated solicitation authority, will provide copies of received quotes, bids, proposals and evaluations to the Purchasing Agent, or his/her designee, before purchases orders or contracts are executed unless otherwise directed by the Purchasing Agent.

AR 3061.11 Americans with Disabilities Consideration during Procurement

District staff shall include accessibility as a criterion during purchasing decision making. Whenever possible, evaluate design, office supplies, furniture and building materials purchases for compatibility with a wide range of disabilities and sensitivities. Select items that are easily adjustable or can be modified to accommodate a variety of physical and ergonomic needs.

BP 3070 Records Retention and Management

Adopted: September 11, 2006
Amended: September 27, 2010
Supersedes: N/A

The District shall manage the life cycle of District records and information under a consolidated records management program and ensure that all records are protected, stored, retrieved, and archived with accuracy, efficiency, and compliance.

The District's records shall be classified and retained, destroyed, and disposed of pursuant to resolutions adopted from time to time by the Board of Directors in accordance with Water Code section 21403 and Government Code section 60201, or their successors.

AR 3070 Electronic Mail Management and Retention

Adopted: October 15, 2014

AR 3070.1 Purpose

The El Dorado Irrigation District ("District") provides electronic mail ("e-mail") to its employees to facilitate the conduct of District business. In return for providing e-mail, the District expects its employees to manage and protect records resulting from their e-mail communications. This regulation describes the responsibilities of all District employees concerning the creation, removal, storage, and retention of e-mails.

District e-mail and e-mail systems are intended solely as a means of communicating information. No District e-mail user is authorized to use the District e-mail system for the long-term storage and maintenance of District records. To ensure the District e-mail system functions as intended, it is imperative that all District employees and e-mail users regularly delete e-mails from the system as provided in this regulation.

This regulation supplements and is intended to be carried out in concert with District's Records Retention Schedule ("Records Schedule"). While not all e-mail communications are District records, all e-mail communications are subject to discovery and can be used as electronic evidence in the event of litigation. Unmanaged and unidentified e-mails residing on District computers could create expensive and unmanageable problems in the event of litigation and pose a threat to District's ability to properly and coherently document and reconstruct business and decision-making processes.

The following items detail specific features of the District's computer network and related hardware and software that comprise the District e-mail system:

1. The District performs an electronic back-up of its computer network, including the e-mail system, following each business day. Those back-ups are an electronic recording of the status of District's computer systems at a particular moment in time and cannot accurately capture or reflect all e-mail or other activity that occurred on the District's computer network on a specific day. For example, a back-up does not capture items on employees' physical computer desktop or in their non-network drives.

2. The District maintains a particular computer system back-up for no more than two weeks, after which that back-up is completely overwritten. Such overwriting is necessary for management and security reasons and to aid the recovery of the computer system in case of a complete failure. Because the process is transitory, a back-up is not reliable and cannot constitute District records.

3. The District maintains an e-mail filtering system that is intended to reduce SPAM, Phishing, viruses, and other unwanted cyber-security threats from entering the District's network. District employees are responsible for promptly reviewing summary e-mail lists from the e-mail filter to determine if valid e-mails were captured by the filter and to delete unwanted, unknown or potentially threatening e-mails. The e-mail filtering system automatically and permanently deletes filtered e-mail after a set time period.

4. The District maintains an e-mail removal system that is intended to automatically dispose of e-mail messages that are unwanted or no longer relevant. District employees are responsible for promptly reviewing incoming, draft, and sent e-mail to determine and segregate for separate handling those that constitute District records, to delete unwanted, unknown or potentially threatening e-mails, and to delete or allow the removal of all other e-mails. The e-mail removal system automatically and permanently deletes e-mail after a set time period depending upon the folder location of the e-mail message.

AR 3070.2 Scope of Regulation

Some e-mail communications constitute District records. Therefore, e-mails also may be governed by the District's Records Schedule depending on their use, character, and contents. In general, e-mail communications fall into three categories:

1. E-mails (including attachments) that document official District business, which include conducting a business transaction with a vendor or consultant, interacting with regulatory agencies, responding to a public information request, and directing employees or consultants are District records and are subject to the District's Records Schedule. The employee who receives or sends an e-mail that is a District record is responsible for promptly transferring the record to a paper or electronic medium, as appropriate, and then filing it and retaining it in accordance with the Records Schedule.

2. E-mails (including attachments) that provide specific information, document an event or communication that serves a transitory official purpose, or involve informal communications - such as announcing the date and time of a meeting or event, responding to professional "list serves" an employee participates in, or circulating draft documents - are not considered District records. Typically, this type of e-mail serves its purpose

once it is read, responded to, or superseded and there is no need to retain it. Occasionally the employee who sends or receives this type of e-mail needs to intentionally save the e-mail for a limited period of time for informational or official purposes. When this need arises, the employee may place the e-mail into a user-defined folder where the e-mail message can be retained for up to 2 years. If an employee believes that any e-mail of this type constitutes a District record, such an e-mail or attachment should be promptly transferred to a paper or electronic medium, as appropriate, and then filed and retained in accordance with the Records Schedule. If an employee is unsure about whether or not an e-mail that falls into this category constitutes a District record, the employee should put it into a user-defined folder to safeguard the e-mail until a final determination can be made and appropriate action taken.

3. E-mails (including attachments) providing personal or general information - such as personal messages, informal communications between employees, meeting or event announcements and reminders, linking to news articles, and working notes and drafts (unless intentionally saved for an official purpose) are not District records. This type of e-mail serves its purpose once it is read, responded to, or superseded and the employee shall promptly delete it or allow it to be removed automatically.

The District's Information Technology staff shall administer this regulation, with oversight and ultimate authority over the regulation exercised by the General Manager.

AR 3070.3 E-mail Retention and Removal

Each District employee is expected to review their e-mail messages at least once each business day under normal circumstances. If an employee will be away from work or unable to review their e-mail, they must notify e-mail senders with an out of office alert or make other provisions to ensure that e-mail is reviewed promptly. Additionally, each District employee is expected to appropriately manage their e-mail messages on a regular basis. E-mail management at least weekly is encouraged as a best practice.

Any e-mail communications (including attachments) that constitute District records must be saved as a paper or electronic document in accordance with the District's Records Schedule. Each District employee is responsible for complying with this regulation with respect to the e-mails they send or receive. If an employee has any question or concern about retaining an e-mail or attachment or other issues of compliance with this regulation, they should discuss the issue with the Information Technology or Records Management staff, as appropriate. If deemed necessary, the Records Management or Information Technology staff may consult with the General Manager and legal counsel about any e-mail retention or removal issue.

E-mail (including attachments) contained in an employee's electronic mailbox within the District e-mail system will be automatically and permanently deleted from the following folders or their sub-folders when the date and time stamp of the e-mail exceeds the identified age:

Folder	Automatic e-mail removal after
Deleted items folder	30 days
Junk e-mail folder	30 days
Inbox	90 days
Sent items folder	90 days
Drafts folder	90 days
Employee-defined folder	2 years

Therefore, e-mails that have continuing business value to District or one of its employees or officers or are otherwise deemed District records under this regulation must be stored on an employee-defined e-mail folder in the short or intermediate term, or stored long-term on an appropriate paper or electronic medium for the duration prescribed by the District Records Schedule.

Whenever feasible, e-mail messages should be filed with other District records concerning the same subject matter or program to ensure that such e-mails are preserved, stored and disposed of in the same manner as like records. If an e-mail does not relate obviously or directly to an existing District subject file or program, an employee should either request that a new records retention category be created or file the e-mail with correspondence.

These rules also apply to any attachments to e-mails, which should be handled in the same manner as described above.

District employees and officers are prohibited from keeping any District-related documents or e-mails on e-mail systems, electronic devices, storage media, or storage services that are not provided by the District nor that are not expressly authorized by the District for this purpose. In addition, employees shall not retain District records or e-mails in alternate locations for the intent or purpose of circumventing the District's Records Schedule or Electronic Mail Management and Retention Regulation.

It is the responsibility of each District employee to comply with this regulation and to manage their e-mails in accordance with it. All employee use of e-mail, including personal use, is subject to District's E-mail/Internet/Computer Use policies provided in the Employee Handbook, as such policies may be amended or restated from time to time. In accordance with those E-mail / Internet / Computer Use policies, the District reserves the right at any time to review employees' e-mail boxes and to purge any e-mails retained there in violation of this regulation.

BP 3080 Claims against the District

Adopted: September 11, 2006
Supersedes: Policy #10
Revised: August 13, 2012

The District shall adopt administrative regulations that comply with state law for the review and disposition of claims for damages submitted to the District pursuant to the Government Claims Act (Gov. Code §§900-935). Such procedures shall be designed to provide a fair, open, and unbiased process that avoids conflicts of interest, collusion, and favoritism. Claims not covered by the District's insurer of less than and including $50,000 shall be resolved by the General Manager; the Board of Directors shall review and resolve claims greater than $50,000.

AR 3081 Claims Against the District

Approved: December 12, 2006
Revised: October 16, 2012

Pursuant to Gov. Code § 935, the District hereby adopts the following claims procedure: All claims against the District subject to the Government Claims Act (Gov. Code §§ 810 et seq.) ("Act"), and all other claims not governed by any other statute or regulation expressly relating thereto, shall be submitted to the District in accordance with the procedures set forth in the Act (Gov. Code, §§ 900-935.4), preferably using the District's claims form. The District shall process such claims in accordance with the Act. The District's Risk Analyst, is delegated the authority of the General Manager to take action on and resolve any and all claims against the District subject hereto of less than, and including, $50,000, but any action taken by the Risk Analyst shall first be approved by the District's General Counsel. The Risk Analyst may submit any and all claims subject to this regulation to the District's insurer, and will work with the District's insurer in the adjustment of such claims.

BP 3090 Investment Policy

Adopted: September 11, 2006
Supersedes: Policy #46

The District's funds shall be invested by District bonded personnel in accordance with principles of sound treasury management and the provisions of California Government Code Sections 53600 et seq.. It is the General Manager's responsibility to ensure that the District's investments provide the highest safety and security for the portfolio, match maturities to future liabilities, and meet daily cash flow demands while achieving the highest possible market rate of return.

AR 3091 Investment

Approved: December 12, 2006

The ultimate goal is to enhance the economic status of the District while protecting its funds. Investments will be accomplished in a manner that provides the highest safety and security for the portfolio, matches maturities to future liabilities, and meets daily cash-flow demands while trying to achieve the highest available average market rate of return.

AR 3091.1 Scope

This policy and subsequent administrative regulations cover all funds and investment activities that are under the direct authority of the District. These funds are accounted for in the District's financial reports and include:

- water and wastewater funds
- capital improvement funds
- debt service funds
- recreation funds
- hydroelectric funds

Investment of bond proceeds shall be governed by these regulations unless otherwise specified by the provisions of related bond indentures. Interest earnings and expenses are allocated proportionately and equitably to each fund.

AR 3091.2 Prudence

The standard of prudence to be used by investment officials shall be the "prudent person" standard and shall be applied in the context of managing an overall portfolio. Investment officers acting in accordance with written procedures and this investment policy and exercising due diligence shall be relieved of personal responsibility for an individual security's credit risk or market price changes, provided deviations from expectations are reported in a timely fashion and the liquidity and sale of securities are carried out in accordance with the terms of this policy.

"...investment shall be made with judgment [sic] and care, under

circumstances then prevailing, which persons of prudence, discretion and intelligence exercise in the management of their own affairs, not for speculation but for investment considering the probable safety of their capital as well as the probable income to be derived."

AR 3091.3 Objectives

Temporarily idle or surplus funds of the District shall be invested in accordance with principles of sound treasury management and in accordance with the provisions of California Government Code Sections 53600 et seq. and this Investment Policy. The primary objectives, in priority order, of investment activities shall be:

AR 3091.4 Safety of Principal

The preservation of principal is of primary importance. Each transaction shall seek to ensure that capital losses are avoided, whether they be from securities default or erosion of the market value. The portfolio is priced to market on a monthly basis.

The District shall seek to preserve principal by mitigating the following two types of associated risk:

Credit Risk, defined as the risk of loss due to failure of the issuer of a security, shall be mitigated by limiting investments to the safest types of investment grade securities and by diversifying the investment portfolio so that the failure of any one issuer would not unduly harm the District's cash flow.

AR 3091.5 Investment Committee

The District established an Investment Committee in 1993 as a sub-committee of the Asset and Liability Management Committee. The Investment Committee consists of the department head for Finance and Management Services/District Treasurer, the District's Deputy Treasurer, and the department head for Environmental Compliance and Water Policy. The purpose of the committee is to review all investment activity and investment strategies. This committee meets quarterly, or more frequently if the need arises, to review the investments of the previous quarter and develop future strategy.

The following table sets portfolio-wide exposure limits (the

Investment Committee may set more specific limits). In addition, the limit on any single issuer is set at 10 percent for corporate and 30 percent for government agency.

Asset Classification	**Minimum Exposure**	**Maximum Exposure**
LAIF + California Asset Managment Trust	Greater of 20% or 3 months of normalized operating and capital expenditures	75%
US Treasury Issues	0%	75%
Government Agency	0%	80%
All Other*	0%	40% or less

* See Authorized Investments for specific details.

Securities purchased under the Asset Classification of "All Other" require ratings by Moody's and Standard & Poor's. Minimum credit ratings are set in the table below.

Asset Classification	**Moody's Rating**	**S & P Rating**
Short-Term	P-1	A-1 or better
Long-Term	A2 or better	A or better
Issuer Disqualifier*	Below P-1 or A2	Below A-1 or A

* *Issuer Disqualifier* means that regardless of the ratings of a particular issue, if the issuer itself has other, senior debt that fall below any of these standards, none of the issues will qualify. For example, if a long-term issue under consideration is rated A2/A, which would normally qualify, but the issuer's commercial paper (short term) is rated A-1/P2, then the issue would still be disqualified.

If a security in the portfolio is downgraded to a level below the minimum credit rating the managers of the Pooled Investment funds will report the downgrading to the other members of the Investment Committee. Credit risk will also be mitigated by pre-qualifying the financial institutions, broker/dealers, intermediaries, and advisors with whom the District does business.

Market Risk, defined as a market value fluctuation due to overall changes in the general level of interest rates, shall be mitigated by:

a. structuring the investment portfolio so that securities mature to meet cash requirements for ongoing operations and matching future liabilities, thereby avoiding the need to sell securities on the open market prior to maturity, and

b. by investing operating funds primarily in shorter-term securities.

It is recognized, however, that in a diversified investment portfolio, occasional measured losses are inevitable and must be considered within the context of the overall investment return and current economic circumstances

AR 3091.6 Liquidity

The investment portfolio shall remain sufficiently liquid to meet all operating requirements that may be reasonably anticipated. This is accomplished by structuring the portfolio so that securities mature concurrent with cash needed to meet anticipated demands. Furthermore, since all possible cash demands cannot be anticipated, the portfolio should consist largely of securities with active secondary or resale markets. Emphasis should be on marketable securities with low sensitivity to market risk. Additional liquidity considerations include issue size, denomination, market of issuance and form of security.

AR 3091.7 Yield

The investment portfolio shall be designed with the objective of attaining a market average rate of return throughout budgetary and economic cycles, taking into account the investment risk constraints and liquidity needs. Return on investment is of least importance compared to the safety and liquidity objectives described above. The core of investments is limited to relatively low-risk securities in anticipation of earning a fair return relative to the risk being assumed. The District's investment strategy is passive and securities shall not be sold prior to maturity with the following exceptions:

a. a declining credit security could be sold early to minimize loss of principal or
b. a security swap would improve the quality, yield, or target duration in the portfolio. Liquidity needs of the portfolio require that the security be sold.

Given this passive strategy, the benchmark used by the District's

Treasurer to determine whether market average yields are being achieved shall be the one-year U.S. Treasury Note because the weighted average maturity of the portfolio typically averages one year or less.

AR 3091.8 Public Trust

All participants in the investment process shall act as custodians of the public trust. Investment officials shall recognize that the investment portfolio is subject to public review and evaluation. In managing the investment portfolio, the managers should avoid any transactions that might impair public confidence in the District. Investments should be made with precision and care, considering the probable safety of the capital as well as the probable income to be derived.

AR 3091.9 Authority

Authority to manage and responsibility for operation of the investment program is granted to the District Treasurer, derived from the adoption of this policy. The District Treasurer shall carry out and maintain established written procedures and internal controls for the operation of the investment program consistent with this investment policy.

Procedures should include references to safekeeping, delivery vs. payment, investment accounting, repurchase agreements, wire transfer agreements, collateral/depository agreements, banking services contracts, and guidance of the specific use of various tools and electronic systems used. No person may engage in an investment transaction except as provided under the terms of this policy and the procedures established by the District Treasurer. The District Treasurer shall be responsible for all transactions undertaken and shall establish a system of controls to regulate the activities of subordinate officials.

AR 3091.10 Ethics and conflicts of interest

Officers and employees involved in the investment process shall refrain from personal business activity that could conflict with proper execution of the investment program, or that could impair their ability to make impartial investment decisions. Employees and investment officials shall disclose to the General Manager any material financial interest in financial institutions that conduct business within this jurisdiction, and they shall further disclose any large personal financial/investment positions that could be related to the performance of the District's portfolio. Employees and investment officials are prohibited from undertaking personal investment transactions with the same individual who conducts business on behalf of the District.

Investments in negotiable certificates of deposit issued by any financial institution, including credit unions, are prohibited if members of the District's Board or employees with investment decision-making authority serve on the board of directors or the specified committees of the financial institution issuing the negotiable certificate of deposit.

AR 3091.11 Local agency investment fund

Yearly, the District's Investment Committee evaluates the State of California Local Agency Investment Fund (LAIF) as a suitable investment for the District. The state fund may invest in a broader range of securities than the District invests in, and it is important to be aware and comfortable with the securities the state pool purchases. The committee also evaluates the fund's operations, how interest is calculated, and its investment policy and security.

AR 3091.12 California asset management trust

Yearly, the Investment Committee evaluates the California Asset Management Trust as a suitable investment for the District. The fund may invest in a broader range of securities than the District invests in, and it is important to be aware and comfortable with the securities the pool purchases. The committee will also evaluate the fund's operations, how interest is calculated, its investment policy and security.

AR 3091.13 Qualified dealers and institutions

The District Treasurer will maintain a list of financial institutions and broker/dealers with whom the District elects to do business, selected by credit worthiness and who are authorized to provide investment services in the State of California. These may include "primary" dealers or regional dealers that qualify under Securities and Exchange Commission Rule 15C3-I (uniform net capital rule). No public deposit shall be made except in a qualified public depository as established by state laws.

The District Treasurer shall conduct a qualified dealer selection process every three years. All financial institutions and broker/dealers who desire to become qualified bidders for investment transactions must submit the following as appropriate:

- **a.** audited financial statements,
- **b.** proof of National Association of Securities Dealers (NASD) certification,
- **c.** proof of state registration,
- **d.** completed broker/dealer questionnaire, and
- **e.** certification of having read, understood, and agreeing to comply with the District’s investment policy.

All financial institutions and broker/dealers with whom the District elects to transact investment activities will first be interviewed and approved by the Investment Committee and then submitted to the Board of Directors for final approval. An annual review of approved financial institutions and broker/dealers will be conducted by the Investment Committee to examine financial condition and ensure state registration and certification of having read the District’s investment policy.

AR 3091.14 Safekeeping of securities

All trades where applicable will be executed by delivery vs. payment (DVP). This ensures that securities are deposited in eligible financial institution prior to the release of funds. Securities will be held by a third-party custodian as evidenced by safekeeping receipts.

AR 3091.15 Internal controls

The District Treasurer is responsible for establishing and maintaining an internal control structure designed to ensure that the assets of the entity are protected from loss, theft or misuse. The internal control structure shall be designed to provide reasonable assurance that these objectives are met. The concept of reasonable assurance recognizes that (1) the cost of a control should not exceed the benefits likely to be derived and (2) the valuation of costs and benefits requires estimates and judgments by management.

Accordingly, the District Treasurer shall establish a process for annual independent review by an external auditor to assure compliance with policies and procedures. The internal controls shall address the following points:

a. **<u>Control of collusion</u>.** Collusion is a situation where two or more employees are working in conjunction to defraud their employer.

b. **<u>Separation of transaction authority from accounting and record keeping</u>.** Separation of duties is achieved by separating the person who authorizes or performs the transaction from the people who record or otherwise account for the transaction.

c. **<u>Custodial safekeeping.</u>** Securities purchased from any bank or dealer including appropriate collateral (as defined by state law) shall be placed with independent third-party safekeeping.

d. **<u>Avoidance of physical delivery securities</u>.** Book entry securities are much easier to transfer and account for because actual delivery of a document never takes place. Delivered securities must be properly safeguarded against loss or destruction. The potential for fraud and loss increases with physically delivered securities.

e. **<u>Clear delegation of authority to subordinate staff members.</u>** Subordinate staff members must have a clear understanding of their authority and responsibilities to avoid improper actions. Clear delegation of authority also preserves the internal control structure that is contingent on the various staff positions and their respective responsibilities.

f. **<u>Investment and wire transfers</u>.** All wire transfers and investment transactions that occur via the on-line banking system have pre-authorized templates, controls, and security provisions. All transfers require initiation and approval by two authorized persons. Written confirmation is required for all wire transfers. On certain occasions, telephone transactions may occur. Because of the potential for error and improprieties that arises from telephone transactions, all telephone transactions will be supported by written communications and approved by two authorized persons.

g. **Wire transfer agreement with the lead bank or third-party custodian.** This agreement should outline the various controls and security provisions and delineate responsibilities of each party making and receiving wire transfers.

h. **Purchase of investment securities**. The purchase of any security must first be approved by two members of the Investment Committee. Settlement information and instructions sent to safekeeping must first be approved by the District Treasurer. Written confirmation is required for all investment purchase transactions.

AR 3091.16 Authorized investments

The District is governed by the California Government Code Sections 53600 et seq. A copy of the applicable California Government Code provision is attached as Exhibit 1. Within the context of these limitations, the following investments are authorized and further limited:

a. **Local Agency Investment Fund.** The District may invest in the Local Agency Investment Fund (LAIF) established by the State Treasurer for the benefit of local agencies up to the maximum permitted by State law (as established in California Government Code Section 16429.1). There is a 75-percent maximum on the total value of the portfolio which can be invested. The minimum limitation is calculated based on the sum of the balances of LAIF and CAMP. This minimum is the greater of 20% of the total portfolio or three months of normalized operating and capital expenditures.

b. **California asset management trust.** The District may invest in the California Asset Management Trust established as a Joint Powers Authority to provide local California governments with investment management services in a professionally managed money market portfolio. There is a 75-

percent maximum on the total value of the portfolio which can be invested. The minimum limitation is calculated based on the sum of the balances of LAIF and CAMP. This minimum is the greater of 20% of the total portfolio or three months of normalized operating and capital expenditures.

c. **U.S. Treasury issues.** U.S. Treasury Bills, Bonds, and Notes are those for which the full faith and credit of the United States are pledged for payment of principal and interest. There is a 75-percent maximum limitation on the total market value of the portfolio that can be invested in this category, although the five-year maturity limitation is applicable.

d. **Government agency.** Obligations are issued by the Government National Mortgage Association (GNMA), the Federal Farm Credit System (FFCB), the Federal Home Loan Bank Board (FHLB), the Federal National Mortgage Association (FNMA), the Student Loan Marketing Association (SLMA), and the Federal Home Loan Mortgage Association (FHLMC). There is a 80-percent maximum limitation on these issues, and a 30-percent limit for a single agency name because U.S. government backing is implied rather than guaranteed on some types of issues. The five-year limitation is applicable.

e. **Other**

1. *Bills of Exchange or Time Drafts* drawn on and accepted by a commercial bank, otherwise known as *Banker's Acceptances*, are eligible for purchase by the Federal Reserve System. Bankers' acceptances purchased may not exceed 180 days to maturity or 40 percent of the portfolio's market value. No more than 30 percent of the District's surplus funds may be invested in the bankers' acceptances of any one commercial bank.

2. *Commercial Paper* ranked "P1" by Moody's Investor Services or "A1" by Standard and Poor's and issued by a domestic corporation having assets in excess of $500,000,000 and having an "A2" or better rating on its long-term debentures as provided by Moody's and a rating of "A" or better by Standard and Poor's. Purchases of eligible commercial paper may not exceed 180 days to maturity nor represent more than 15 percent of the market value of the portfolio. This percentage may be increased to 30 percent if the dollar weighted average maturity does not exceed 31 days. No more than 10 percent of the market

value of the portfolio may be invested in commercial paper issued by any one corporation.

3. *Medium Term Corporate Notes*, with a maximum maturity of five years, may be purchased. Securities eligible for investment shall be rated "A2" or better by Moody's or "A" or better by Standard and Poor's rating services. The notes must be issued by corporations organized and operating in the United States or by depository institutions licensed by the United States or any state and operating in the United States. Purchase of medium term notes may not exceed 30 percent of the market value of the portfolio, and no more than 10 percent of the market value of the portfolio may be invested in notes issued by one corporation. Commercial paper holdings should also be included when calculating the 10- percent limitation.

4. *Negotiable Certificates of Deposit* issued by a nationally or state charged bank or state or federal savings institution. Purchases of negotiable certificates of deposit may not exceed 25 percent of the market value of the portfolio. The maturity limitation of five years is applicable.

5. *Repurchase Agreements.* The District may invest in repurchase agreements with banks and dealers with which the District has entered into a master repurchase contract that specifies terms and conditions of repurchase agreements. The maturity of repurchase agreements shall not exceed 90 days. The market value of securities used as collateral for repurchase agreements shall be monitored daily by the District Treasurer's staff and will not be allowed to fall below 100 percent of the value of the repurchase agreement. To conform with provisions of the Federal Bankruptcy Code, which provides for the liquidation of securities held as collateral for repurchase agreements, the only securities acceptable as collateral shall be eligible negotiable certificates of deposit, eligible bankers' acceptances, or securities that are direct obligations of, or that are fully guaranteed as to principal and interest by, the United States or any agency of the United States.

6. *Collateralized Negotiable Investments*. The District may invest in notes, bonds, or obligations that are at all times secured by a valid first-priority security interest in

securities of the types listed by Section 53651 as eligible securities for the purpose of securing local agency deposits and have a market value at least equal to that required by Section 53652 for the purpose of securing local agency deposits. The securities serving as collateral shall be placed by delivery or book entry into the custody of a trust company or the trust department of a bank that is not affiliated with the issuer of the secured obligation, and the security interest shall be perfected in accordance with the requirements of the Uniform Commercial Code or federal regulations applicable to the types of securities in which the security interest is granted.

7. *Monies held by a trustee or fiscal agent and pledged* to the payment or security of bonds or other indebtedness, or obligations under a lease, installment sale, or other agreement of a local agency, or certificates of participation in those bonds, indebtedness, or lease installment sale, or other agreements. These may be invested in accordance with the statutory provisions governing the issuance of those bonds, indebtedness, or lease installment sale, or other agreement, or to the extent not consistent therewith or if there are no specific statutory provisions, in accordance with the ordinance, resolution, indenture, or agreement of the local agency providing for the issuance.

AR 3091.17 Ineligible investments

Investments not described in these regulations shall not be included in the District's portfolio. Derivative securities, for example, are ineligible investments. They are financial instruments whose value depends on (is derived from) the value of one or more underlying assets or indexes of asset values. The term "derivative products" refers to instruments or features such as collateralized mortgage obligations (CMOs), interest only strips (IOs and principal-only (POs), forwards, futures, currency and interest rate swaps, options, floaters/inverse floaters, and caps/floors/collars. Any security that could result in zero interest accrual if held to maturity is ineligible.

The District Treasurer may seek the Board’s approval for any modifications to the list of eligible investments as state laws are revised or as market and risk conditions change.

AR 3091.18 Reporting

The District Treasurer will provide to the Board, General Manager, Internal Auditor, and the Investment Committee quarterly investment reports that provide a clear picture of the status of the current investment portfolio. The reports should include comments on fixed income markets and economic conditions, discussion regarding restrictions on the percentage of investment by categories, possible changes in the portfolio structure going forward, and thoughts on investment strategies. Required elements of the quarterly report include:

- **a.** A list of individual securities held at the end of the reporting period by authorized investment category.
- **b.** Average life and final maturity of all investments listed.
- **c.** Coupon, discount, or earnings rates.
- **d.** Par value, amortized book value, market value, source of market value, and unrealized gains/losses.
- **e.** Percentage of the portfolio represented by each investment category.
- **f.** Summary of quarterly transactions.
- **g.** Certification of compliance with the District's investment policy.
- **h.** Year-to-date summary of interest earnings (forecast vs. actual).
- **i.** Year-to-date estimate of arbitrage rebate.
- **j.** Six-month cash-flow forecast.

The quarterly report will graphically illustrate portfolio benchmark performance to the market average rate of return.

BP 3095 Delegation of Investment Function

Adopted: September 11, 2006
Supersedes: Policy #46

Delegation of the investment function by any local governing body is limited to a one-year period. The Board will delegate the investment function to the District Treasurer in conjunction with its annual investment review and adoption. The District Treasurer may delegate investment and cash management operational duties to others as approved by Board resolution.

BP 3096 Investment Policy Certification

Adopted: September 11, 2006
Supersedes: Policy #46

It is the responsibility of the District's Treasurer to submit the District's investment policy and administrative regulations for re-certification by the Municipal Treasurer's Association of the United States and Canada every three years. The intent is to ensure compliance with all current legislative requirements and professional standards and practices of prudent investment management.

Exhibit 1: Summary of Authorized Investments

INVESTMENT TYPE	CONDITIONS	TERM
LAIF + California Asset Management Trust	Minimum Limit: Greater of 20% or 3 months of normalized operating and capital expenditures Limit: 75% maximum	n/a
U.S. Treasury Bills, Bonds and Notes	Limit: 75% maximum	5 years
Agencies of the U.S. Govt.	Limit: 80% maximum – Prudent investor rule applies, no more than 30% of max. for a single agency	5 years
Other		
1. Bankers acceptances	Limit: 40% , no more than 30% in any one commercial bank	**180 days**
2. Commercial paper	Domestic corp – assets $500,000,000 – A1 P1 rating. Limit: 15% of portfolio market value, 30% if average maturity does not exceed 31 days. No more than 10% of max. in any single corporation.	180 days
3. Medium term notes	Limit: 30% of total market value- no more than 10% in one corporation, rated A or better, corporations operating, organized & licensed in U.S.	5 years
4. Negotiable Certificates of Deposit	Limit: 25%	5 years
5. Repurchase agreements	Master repurchase agreements. Securities collateral. See Investment Policy	90 days
6. Collateralized negotiable investments	Secured by a valid 1st priority security interest of types listed in Section 53651 as eligible securities – market value equal to that required by Section 53652.	5 years

	See Investment Policy.	
7. Monies held by a trustee or fiscal agent	Pledged for payment of bonds, other indebtedness, lease obligations, installment sale, or other agreement of a local agency. COP's in investments mentioned above. See Investment Policy.	5 years

El Dorado Irrigation District

BP 4000 HUMAN RESOURCES

BP 4010 Human Resources Policy

Adopted: August 28, 2006
Supersedes: Policy No. 6 – Adopted August 19, 1980, Amended February 28, 1994

The General Manager is responsible, either directly or through assignment, for developing clear, fair, and organized human resources regulations. The regulations should establish conditions that will attract and retain the highest qualified individuals for all positions.

The human resources regulations shall:

- clarify the rules of employment;
- include effective procedures for handling grievances;
- protect against retaliation for non-disruptive expression of dissent;
- acquaint employees with the District's interpretation of their protections under this policy;
- ensure that standards, programs, and procedures meet or exceed acceptable industry standards as written in state and federal regulations;
- ensure a healthy and safe work environment for all District employees;
- ensure that people who work for or on behalf of the District are paid a competitive wage and are provided competitive benefits; and
- comply with all applicable state and federal laws and regulations.

AR 4010 Concepts and Roles in Human Resources

Approved: December 12, 2006

The District desires to attract and retain the best qualified people for the benefit and welfare of EID customers and to meet customer expectations.

Accordingly, human resources regulations must be:

- implemented in an atmosphere of mutual trust and good will,
- consistent with policies established by the Board of Directors, and
- consistent with applicable state and federal rules and regulations.

AR 4011 Role of the Director of Human Resources

Approved: December 12, 2006

The Director of Human Resources is responsible for ensuring that the District:

- attracts and retains qualified employees within the context of management succession planning and overall workforce planning;
- determines fair and equitable salary schedules for unrepresented, management, and confidential employees;
- negotiates with employee organizations;
- maintains an atmosphere that engenders a positive work environment;
- establishes disciplinary processes, including an appeals process, that adheres to all applicable statutes and regulations in accordance with the human resources regulations described in the collective bargaining agreement and the employee handbook;
- fosters and supports equal employment opportunities;
- fosters and supports a high level of employee performance and satisfaction; and
- establishes employee development and performance evaluation procedures to enhance and improve performance.

El Dorado Irrigation District

AR 4012 El Dorado Irrigation District Employee Handbook

Approved: December 12, 2006

In accordance with BP 4010, the District's employee handbook is provided to new employees on their first day of employment at the District.

Copies of the handbook are available upon request.

AR 4013 Harassment-Free Work Environment

Approved: December 12, 2006

The District is committed to providing a workplace free of harassment. This includes harassment based on factors such as race; color; gender; religion; national origin; ancestry; age; physical and mental disability; medical condition; veteran status; sexual orientation; marital status; family care or medical leave status; and pregnancy, childbirth, and related medical conditions.

The District will not tolerate harassment of employees by non-employees with whom District employees have a business, service, or professional relationship.

Harassment includes verbal, physical, and visual conduct that creates an intimidating, offensive, or hostile working environment or that interferes with work performance. Such conduct constitutes harassment when (1) submission to the conduct is made either an explicit or implicit condition of employment; (2) submission to or rejection of the conduct is used as the basis for an employment decision; or (3) the harassment interferes with an employee's work performance or creates an intimidating, hostile, or offensive work environment.

Harassing conduct may take many forms and includes but is not limited to the following: intimidation; slurs; jokes; statements; gestures; assault; impeding or blocking another's movement or otherwise physically interfering with normal work; and pictures, drawings, or cartoons based on an employee's gender, race, color, national origin, religion, age, physical disability, mental disability, medical condition, ancestry, marital status, sexual orientation, family care or medical leave status, marital status or any other legally protected category or status.

Sexually harassing conduct in the workplace includes all of the prohibited actions listed above as well as unwelcome conduct such as requests for sexual favors, conversation containing sexual comments, and unwelcome sexual advances.

AR 4013.1 Reporting Harassment

Any incident of harassment shall be reported immediately to a supervisor or manager, to any member of management, or to Human Resources. Managers who receive complaints or who observe harassing conduct must inform Human Resources immediately. The District emphasizes that employees are not required to notify their supervisor if that supervisor is the individual who is harassing the employee or if an employee feels uncomfortable discussing the situation with the supervisor. An employee may always directly contact Human Resources to report this type of situation.

Reported instances of harassment will be investigated thoroughly. Confidentiality will be maintained throughout the investigation to the extent possible while still maintaining our legal obligation to conduct a full investigation.

The District will not tolerate retaliation against any employee for cooperating in an investigation or for making a complaint to Human Resources or to any manager. If it is established that unlawful harassment has occurred, appropriate action will be taken to correct the situation. Such action may include, but is not limited to, oral or written counseling, disciplinary suspension or probation, or discharge from the organization.

AR 4013.2 Responsibility

Supervisors are obligated to prevent violation of this policy and are responsible for taking prompt actions to end any discriminatory or sexually harassing behavior or conduct. Human Resources is responsible for promptly hearing and investigating employees’ complaints of discrimination or sexual harassment and for communicating any recommendations for remedies to appropriate management for implementation when violations of policy are identified.

AR 4014 Medical Reimbursement Program

Approved: March 7, 2007
Revised: June 3, 2011
Revised: March 11, 2013

AR 4014.1 Medical Reimbursement Program

The purpose of the District's Medical Reimbursement Program is to allow eligible participants to be reimbursed for up to $2,500 per year of legitimate, documented medical, dental, and vision costs and expenses not covered by insurance, as well as healthcare insurance premium costs not otherwise paid by the District. Eligible expenses will be approved by the Human Resources Director before reimbursement is processed through the payroll system. Reimbursements are reported as income on participants' W-2 forms.

AR 4014.2 Medical Reimbursement Program – eligible participants

Eligible participants in the Medical Reimbursement Program are all members of the Board of Directors, the General Manager, the General Counsel, and any other at-will, contract employees.

AR 4014.3 Medical Reimbursement Program – eligible expenses

To be eligible, all claimed expenses must be accompanied by invoices, receipts or equivalent documentation accepted by the Human Resources Director as sufficient to demonstrate that the expense is one of the following:

- Services provided by a bona fide healthcare provider to an eligible participant, their spouse, domestic partner, or dependant; directly paid by an eligible participant, their spouse, or domestic partner; and not covered by insurance;
- Goods or services prescribed by a bona fide healthcare provider to an eligible participant, their spouse, domestic partner, or

dependant; directly paid by an eligible participant, their spouse, or domestic partner; and not covered by insurance; or

- Healthcare insurance premium costs for a policy covering an eligible participant, their spouse, domestic partner, or dependent, and not otherwise paid by the District.

AR 4014.4 Medical Reimbursement Program – ineligible expenses

The following medical expenses are not eligible for reimbursement:

- Cosmetic medical procedures with no therapeutic purpose; and
- Medical marijuana purchased pursuant to California's Compassionate Use Act.

AR 4015 Injury and Illness Prevention Program

Approved: June 16, 2009

District management recognizes the need to ensure a safe and healthy work environment for its employees, volunteers, contractors, visitors, and the public. An important element in meeting this goal is the District's Injury and Illness Prevention Plan (IIPP). The plan has been developed in accordance with the California Code of Regulations, General Industry Safety Order 3203, which requires IIPPs for California-based operations.

The IIPP clearly states expectations for safety responsibilities at all levels within the organization and provides personnel a reference for consistent safety compliance. It is implemented as a continuous improvement program and is reviewed—and revised, if needed—on an annual basis. At a minimum, IIPP specifies and addresses the following:

1. Name(s) and title(s) of personnel responsible for the program.
2. EID's system for identifying and evaluating workplace hazards, including scheduled periodic inspections to identify unsafe conditions and work practices.
3. EID's methods and procedures for correcting any unsafe or unhealthy work practices and conditions in a timely manner.
4. An occupational health and safety training program designed to instruct employees in safe and healthy work practices and in hazards specific to each employee's job assignment.
5. A procedure to investigate occupational injuries and illnesses.
6. EID's system for communicating with employees on occupational health and safety matters, including provisions designed to encourage employees to identify and report hazards at the work site without fear of reprisal.
7. EID's system for ensuring that employees comply with safe and healthy work practices, which may include disciplinary action for failure to comply.

A copy of the plan is available at http://peoplescope/Pages/Default.aspx or upon request from the Safety/Security Office.

El Dorado Irrigation District

BP 5000 WATER SUPPLY

BP 5010 Water Supply Management

Adopted: August 28, 2006
Supersedes: Regulation No. 1 – adopted March 24, 1982, amended April 21, 2003
Regulation No. 2 – adopted July 24, 1989, amended August 6, 2001
Regulation No. 3 – adopted October 25, 1993
Regulation No. 7 – adopted December 14, 1988, amended October 21, 2002
Regulation No. 10 – adopted September 30, 1981, amended February 7, 2000
Regulation No. 11 –adopted June 17, 1984

The Board is committed to provide a water supply based on the principles of reliability, high quality, and affordability in a cost-effective manner with accountability to the public. It is the General Manager's responsibility to ensure that the tenets of this policy are carried out in an open, transparent manner through sound planning, to assure preparedness under varying conditions, and effective management.

It is the policy of the Board that the District will not issue any new water meters if the *Water Resources and Service Reliability Report* indicates that there is insufficient water supply. When warranted by the findings of the report, the General Manager will bring the possibility of restrictions on meter issuance to the Board's attention. Any such restrictions will be established pursuant to Water Code Section 350 et. Seq. of the California Water Code.

AR 5010 Water Availability and Commitments

Approved: December 12, 2006

AR 5010.1 Annual reporting

The District will maintain adequate water supply and demand records to ensure accurate monitoring and reporting. The General Manager will ensure that an updated *Water Resources and Service Reliability Report* is prepared annually for review by the Board of Directors. The report will include the current system firm yield of the overall District, along with the water supply and infrastructure capacity, potential demands, existing commitments, and meter availability for each water service area of the District as defined in the report.

AR 5010.2 Shortages

The *Water Resources and Service Reliability Report* will use a system firm yield method to determine that sufficient water supply exists to meet potential demands. Under this methodology, approximately 95% of the time sufficient water supply is available to meet normal water demands, but during the remaining 5% of the time water shortages may occur. Such shortages may result in the implementation of voluntary or mandatory conservation measures.

AR 5010.3 New meter restrictions

Should findings in the *Water Resources and Service Reliability Report* warrant restrictions on the issuance of new water meters, the General Manager will bring the situation to the attention of the Board of Directors. During emergency conditions when supplies are restricted or limited, the General Manager may also bring to the Board's attention possible restrictions on water meter availability.

El Dorado Irrigation District

AR 5011 Water Supply Management Conditions

Approved: December 12, 2006
Revised: July 25, 2008

The District recognizes that variations in weather patterns can cause watersheds to yield different quantities of water supply in any given year. In some years, dry weather or drought conditions may occur which result in varying degrees of water shortage. The District also recognizes that future climate change may impact the intensity and duration of future droughts.

The actions required to respond to both near- and long-term changing water supply conditions are outlined in the District's *Drought Preparedness Plan*, adopted by the Board of Directors on February 11, 2008. The following water supply management conditions, and corresponding drought stages, describe the incremental steps needed to manage increasing levels of water shortage.

AR 5011.1 Water supply normal and unrestricted
Drought Stage Zero – Ongoing water conservation

Stage Zero is in effect at all times unless another subsequent stage is declared. Stage Zero reflects periods when normal water supplies and normal distribution capacity are available, and the District anticipates the ability to meet the unrestricted demands of its customers. A prohibition of water waste will be in effect during both normal and restricted water supply conditions.

AR 5011.2 Water supply slightly restricted
Drought Stage 1 – Voluntary reductions in use

The objective of Stage 1 is to initiate public awareness of predicted water shortage conditions, and encourage voluntary water conservation to decrease normal demand up to 15%.

AR 5011.3 Water supply moderately restricted Drought Stage 2 – Voluntary and mandatory reductions

The objective of Stage 2 is to increase public understanding of worsening water supply conditions, encourage voluntary water conservation measures, and then if necessary, enforce mandatory conservation measures in order to decrease normal demand up to 30%.

AR 5011.4 Water supply severely restricted Drought Stage 3 – Mandatory restrictions

The objective of Stage 3 is to enforce extensive mandatory restrictions on water use, and implement water rationing to decrease normal demand up to 50% to ensure that water use is limited to health and safety purposes.

AR 5011.5 Declared water shortage emergencies

The General Manager may also declare a water shortage emergency due to an existing condition or when there is a high probability that a condition will be realized in the near future. Such conditions may include an unexpected disruption of supply, storage, or distribution system facilities.

El Dorado Irrigation District

AR 5012 District Infrastructure and Facilities

Approved: December 12, 2006
Revised: May 25, 2010

AR 5012.1 Connections to District infrastructure

Connections to the District's infrastructure shall be made only by District employees or under the direct supervision of District employees. No connection to District infrastructure shall be made without prior approval.

AR 5012.2 Responsibility for infrastructure maintenance

The District's ownership of and responsibility for the operation and maintenance of facilities will end at the discharge side of the meter, or discharge conduit. In circumstances where the customer owns a testable check valve assembly, the annual testing and maintenance of internal components are conducted by the District. The District will be responsible to operate, maintain, and replace District water mains, flumes, ditches, and other facilities of the District's total supply, transmission, and distribution system. The District's water supply system shall be under the exclusive control and management of duly appointed District personnel, and no one shall have any right to operate, maintain or replace any of the District's water facilities, or interfere with the District system in any manner.

For service through private waterlines or community group systems, measuring devices placed within these systems shall be at the sole discretion of the District. Any such placement, however, does not create an obligation on the part of the District for the operation, maintenance, or replacement of the private waterlines or group system.

El Dorado Irrigation District

AR 5013 Water Service Interruptions or Restrictions

Approved: December 12, 2006
Revised: July 25, 2008
December 20, 2012

Water service interruptions or restrictions may occur during water supply conditions, especially Drought Stages 2 and 3, and water shortage emergencies as declared by the General Manager. The District may, with prior notification, temporarily remove or lock off meters or otherwise interrupt water service to classifications not assigned for human consumption.

Irrigation and agricultural services provided by the District may be subject to an interruption or restriction under these conditions. Temporary Water Use program services provided by the District may also be subject to removal, lock-off, restriction, or discontinuance.

The District may also restrict water availability for Temporary Water Use in certain locations due to constraints in the distribution system.

AR 5013.1 Violations

The District reserves the right to interrupt or restrict, without prior notice, any irrigation or agricultural service, construction, or Temporary Water Use that is found to violate the restrictions imposed by a water shortage condition.

AR 5013.2 Service interruptions due to planned or unplanned maintenance

The District reserves the right at any and all times to shut off water delivery or reduce pressure for the purpose of maintenance or making repairs and alterations to the water system. Whenever possible, advance notice of interruption of service will be given to all affected water users.

AR 5014 Fire Suppression

Approved: December 12, 2006
Revised: December 18, 2012
Revised: August 20, 2013
Revised: February 19, 2015

A fire suppression system may consist of a private interior fire sprinkler system or public fire hydrants. The fire protection agency having jurisdiction over the property will set the fire suppression requirements. The District will provide water for fire hydrants and other fire suppression facilities, but does not warrant or guarantee any range of pressures or rates of flow. The District will not be liable for water pressure or damage in any manner that arises from the availability of water or water pressure at any hydrant or facility used for fire suppression.

The District will provide water at no cost to fire protection agencies for the purpose of fire suppression activities. These activities are limited to equipment maintenance and testing, training, and the filling of fire suppression equipment. All other domestic uses of water, including but not limited to washing of tools, driveways and vehicles, and irrigation uses as well as interior uses at fire stations and any associated training facilities, will be supplied in accordance with District regulations and procedures and must be metered and paid for by the fire protection agency.

AR 5014.1 Fire hydrants

Public fire hydrants for parcels located inside District boundaries will be installed and connected to District mains when requested by the fire protection agency having jurisdiction or when required as a condition of a building permit or subdivision of land. The cost of the fire hydrant assembly and all other appurtenances, including installation, will be paid for by the holder of the building permit or the developer of the project. The District will review, approve, and inspect all public fire hydrant installations.

All public fire hydrants will be owned, operated, tested for functionality, flow tested and maintained by the District from the water main up to and including the hydrant. All fire hydrants may be inspected, tested for functionality, and externally maintained by the fire protection agency.

No person, other than authorized EID or fire protection agency personnel, shall open or draw water from any fire hydrant connected to the District's distribution system without prior specific authorization from the District. Refer to AR 9073 for authorized temporary water use.

The removal or relocation of any public fire hydrant must be approved by the District in advance, and any removal or relocation will be made at the expense of the person or entity requesting the change.

AR 5014.2 Commercial fire suppression services

The property owner will be responsible for the expense of installing a commercial fire suppression system and appropriate backflow prevention device as required by the District.

Water provided to a fire suppression sprinkler system will not be used for any purpose other than extinguishing a fire or testing of the fire protection system.

AR 5014.3 Residential fire suppression services

A residential fire sprinkler system may be served by the residential water meter except if a separate service line and water meter is needed to provide the required fire flow.

El Dorado Irrigation District

AR 5015 Ground Water Supply

Approved: December 12, 2006

Because of the unreliable nature of underground water sources in most of El Dorado County, ground water will not be relied on to augment firm yield supply or as a sole source of water for domestic, irrigation, or fire-fighting purposes. Any consideration of direct ground water augmentation to the existing water system will be evaluated on the basis of short- and long-term reliability, quality, and economics. More than one professional, expert opinion regarding adequacy will be required. The costs of necessary tests, expert opinions, and District staff time will be borne by the applicant.

BP 5020 Cross-Connection Control and Backflow Prevention

Adopted: August 28, 2006
Supersedes: Regulation No. 10 – Prevention of Contamination by Backflow and Cross Connections, Adopted September 30, 1981, Amended February 7, 2000

The District will establish and maintain a cross-connection control program according to the California Code of Regulations - Title 17, Section 7583-7605, or their successors.

AR 5021 Cross-Connection Control and Backflow Prevention

Approved: September 16, 2009

In accordance with BP 5020, the District protects its public water system at the service connection against any actual or potential cross-connection between the public water system and any source or system containing used water, industrial fluid, gas or other substance that is not, or cannot be, approved as safe, wholesome and potable for human consumption. Such protection is enforced through California Code of Regulations Title 17 Section 7584, which requires the District to comply with all applicable state and federal laws required by the Safe Drinking Water Act of 1974, as they are now constituted, or as they may hereafter be amended or recodified, and implemented through the District's "Cross-Connection Control and Prevention of Backflow Program."

A copy of the current "Cross-Connection Control and Prevention of Backflow Program" is available upon request from the Environmental Division.

BP 5030 Water Conservation

Adopted: August 28, 2006
Supersedes: Regulation No. 21 – Conservation, Adopted June 10, 1981

It is Board policy to take reasonable and prudent measures to conserve all water and to adopt and implement water-use efficiency programs that will benefit its customers.

BP 5040 Drought Preparedness and Climate Variability

Adopted: August 28, 2006
Supersedes: Regulation No. 2 – Water Supply Reliability, Adopted July 24, 1989, Amended August 6, 2001

The Board supports the adoption and implementation of a drought preparedness plan to ensure a proactive response to the impacts of drought conditions. Included in the planning effort is consideration of climate variability.

BP 5050 Watershed Management

Adopted: August 28, 2006
Supersedes:

It is Board policy to adopt and support watershed management strategies that will maximize water supply reliability and water quality.

El Dorado Irrigation District

BP 6000 WASTEWATER COLLECTION

El Dorado Irrigation District

BP 6010 Wastewater System Management

Adopted: September 25, 2006
Supersedes: Regulation 13 – adopted October 28, 1987, revised January 24, 1994

The District will maintain a wastewater collection, treatment, and disposal system that complies with applicable state, and federal wastewater discharge requirements and regulations.

AR 6020 Wastewater Discharge and Disposal

Approved: December 12, 2006
Revised: April 1, 2013

Where sufficient capacity exists in mainline and collection sewers, the District will make service available subject to applicable connection procedures and fees. Connection to the District's sewer shall not cause objectionable odors or significant corrosive conditions such as those associated with effluent-only systems or pumped services.

AR 6020.1 Wastewater discharge and disposal

No wastewater or other substances shall be introduced into the District's wastewater system that would:

1. introduce pollutants into the District's treatment plants that will interfere with the plants' operations, including the use or disposal of wastewater sludge, or otherwise be incompatible with operations;
2. interfere with opportunities to recycle and reclaim treated effluent and wastewater sludge;
3. injure or damage any person or property or endanger the public health or safety;
4. cause the District to violate any federal or state law or permit;
5. endanger humans, animals, and fish or other aquatic life in any body of water receiving effluent from the District plants

AR 6020.2 Customer responsibility

Service Lateral Responsibilities

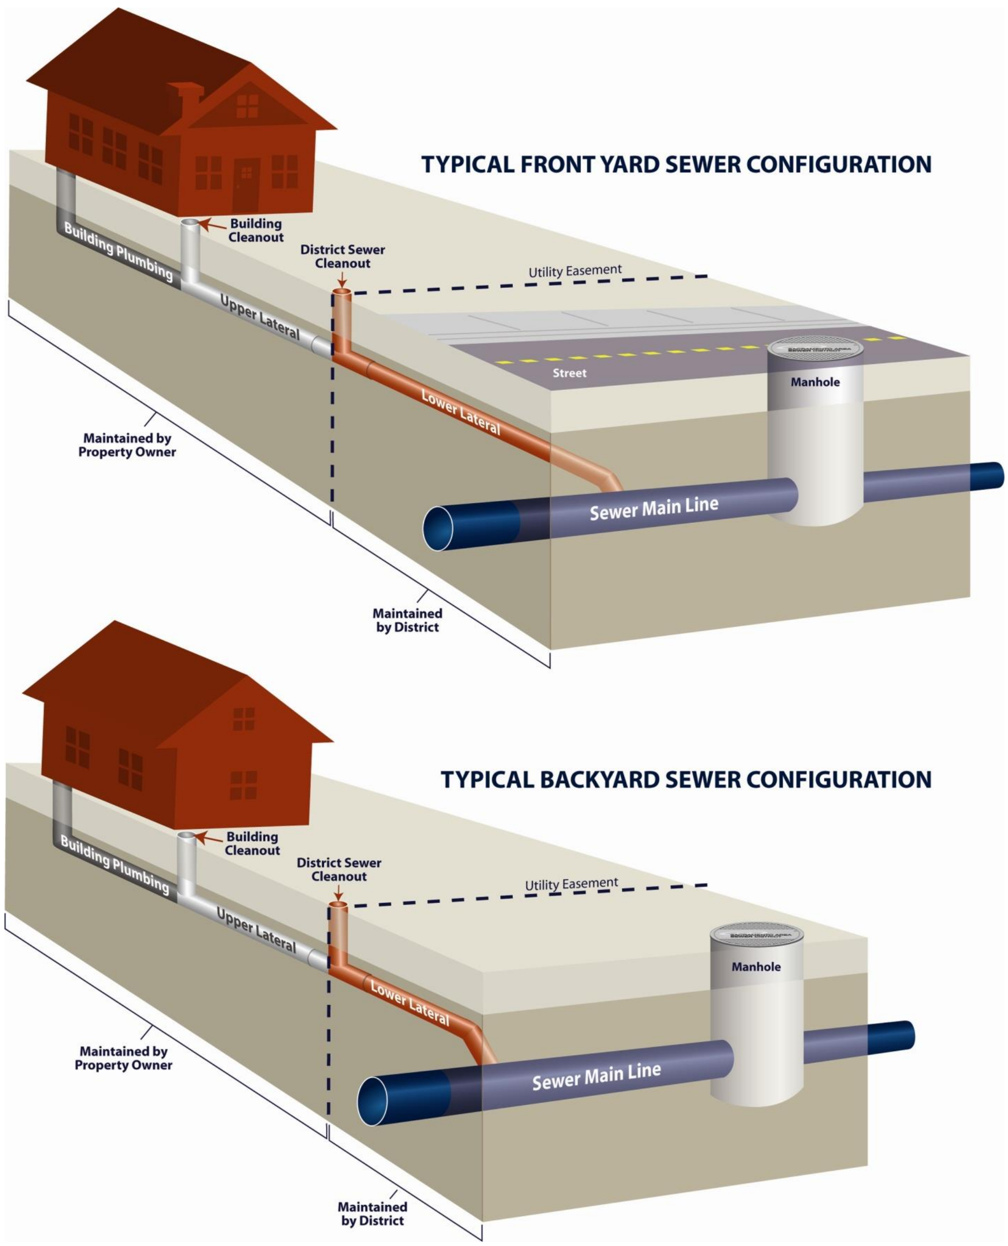
The wastewater service laterals are comprised of an upper and lower portion. The upper lateral is defined as that portion of the wastewater lateral that exists from building plumbing to the cleanout located at or near the utility easement line. In the absence of a cleanout at or near the utility easement line, the upper lateral extends to the utility easement line itself. The lower lateral is defined as that portion of the wastewater lateral from the mainline to the downstream end of the upper lateral, including the cleanout.

The property owner owns and has sole responsibility for clearing stoppages, inspecting, maintaining and repairing the upper lateral. The owner must perform all required maintenance and keep the upper lateral in good condition to avoid negative impacts to the operation and maintenance of the lower lateral. This includes the following:

a) The upper lateral shall be kept free from roots, grease deposits, and other solids that may impede the flow or obstruct the transmission of waste
b) All joints shall be tight, and all pipes shall be sound and free from structural defects, including cracks, breaks, and missing portions, to prevent infiltration and ex-filtration of waste by groundwater or stormwater
c) No drains or other appurtenances that collect stormwater or surface water shall be connected to the upper lateral

The District owns and is responsible for clearing stoppages and for inspecting, maintaining, and repairing the lower lateral. District and owner responsibilities are illustrated in Figure 1 on the following page.

Figure 1:



TYPICAL FRONT YARD SEWER CONFIGURATION
Building Cleanout
Building Plumbing

TYPICAL BACKYARD SEWER CONFIGURATION
Building Cleanout
Building Plumbing
District Sewer Cleanout
Utility Easement
Upper Lateral
Lower Lateral
Manhole
Sewer Main Line
Maintained by Property Owner
Maintained by District

In the absence of a cleanout in the lower lateral, the District reserves the right, subject to approval by the property owner, to install a cleanout at the upstream-end of the lower lateral, or in close proximity thereto. The District maintains sole responsibility for mainlines owned by the District.

Low Pressure Sewer Systems

Low pressure sewer systems are not allowed without approval of the District. If a low pressure sewer system is approved, a private sewer maintenance agreement shall be executed and recorded on all participating properties which will include a delineation of ownership and maintenance responsibilities.

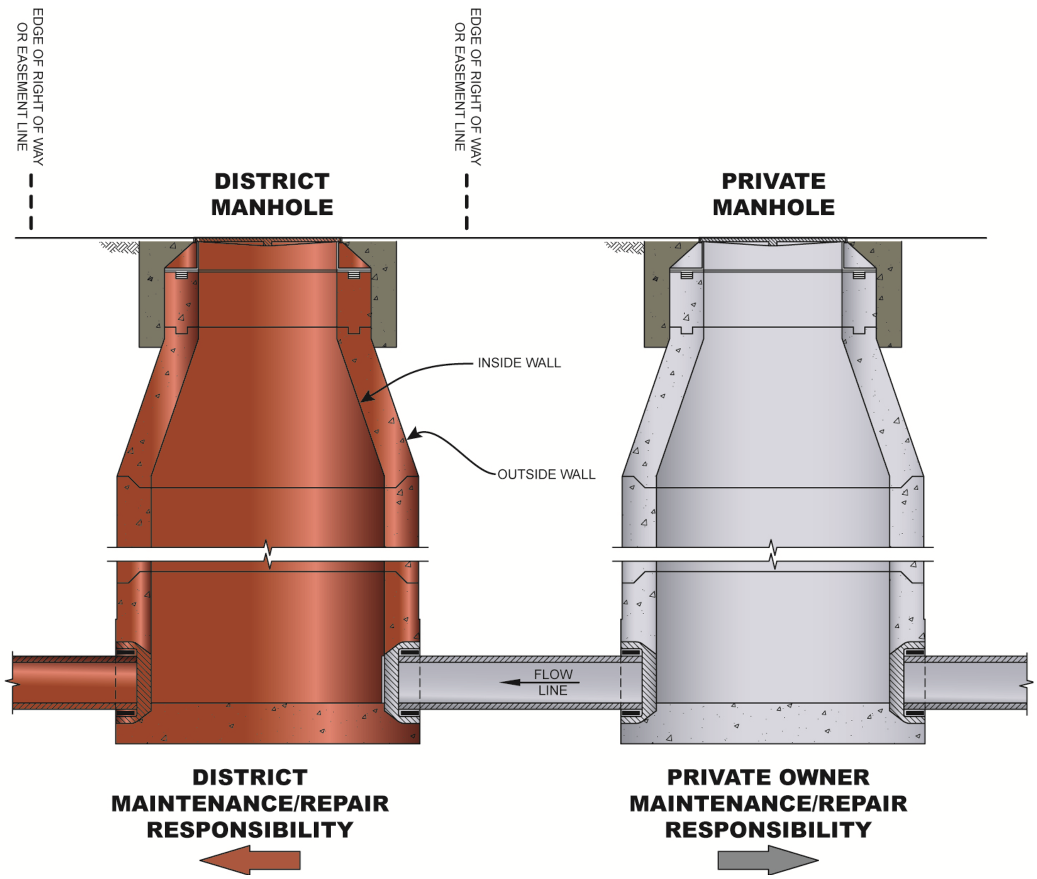
In cases where a parcel or structure is served by a low pressure sanitary sewer collection system, the owner or official/designated owner's group has the sole responsibility for ownership, operation, and maintenance of the low pressure sewer system outside of the utility easement, unless otherwise approved by the District.

The District is not responsible for backups into structures or overflows onto the owner's real property or adjacent real properties caused by grinder pumps, including, but not limited to, a loss of power to or plugging of the grinder pump.

Private System

In cases where a District manhole has been installed to separate a private system from the District sewer system, the end of the pipe at the inside of the upstream wall of the District manhole marks the limit of the District's maintenance and repair responsibility. This responsibility is illustrated in Figure 2 on the following page.

Figure 2



Any customer that violates these regulations will be liable to the District for all direct and indirect costs, expenses, and damages associated therewith, and may be subject to civil liability and/or criminal prosecution.

AR 6021 Industrial Pretreatment Program

Approved: December 12, 2006
Revised: February 25, 2009

In accordance with BP 6010, the District has established and maintains an Industrial Pretreatment Program that complies with applicable state and federal wastewater discharge requirements and regulations.

A copy of the Industrial Pretreatment and Pollution Prevention Program is available upon request from the Environmental Division.

AR 6022 Requirements for the Control of Fats, Oils, and Grease from Food Service Establishments

Approved: June 4, 2009

In accordance with BP 6010, the District controls the amount of fats, oils and grease entering the sewer system from food service establishments to comply with applicable state and federal wastewater discharge requirements and regulations.

A copy of the "Requirements for the Control of Fats, Oils, and Grease from Food Service Establishments" is available upon request from the Environmental Division.

El Dorado Irrigation District

BP 7000 RECYCLED WATER

El Dorado Irrigation District

BP 7010 Authorized and Mandated Use of Recycled Water

Adopted: September 25, 2006
Supersedes: Regulation No. 31
Revised: November 12, 2013

The District mandates the future use of recycled water, wherever economically and physically feasible, as determined by the Board, for non-domestic purposes when such water is of adequate quality and quantity, available at a reasonable cost, not detrimental to public health, and not injurious to plant life, fish, and wildlife. The type of use is defined in Title 22 of the California Code of Regulations. In general, the lands subject to mandatory recycled water use are defined in the most current version of the District's Master Plans.

The District shall have authority to monitor and inspect the entire recycled water system, including on-site facilities, to ensure and enforce compliance with all applicable requirements and standards. The District shall have the right to access customers' premises as required for these purposes. The District may impose penalties and fines and require corrective action for misuse of recycled water.

El Dorado Irrigation District

AR 7010 Suitability of Recycled Water Supplies

Approved: December 12, 2006

Recycled water supplies will meet the applicable conditions in Title 22 of the California Code of Regulations for tertiary treated wastewater.

AR 7011 Determination of Required Use

Approved: December 12, 2006
Revised: November 12, 2013

Non-domestic use includes, but is not limited to, commercial landscape irrigation, residential or multi-family dual plumbed landscape irrigation, construction water, industrial process water, and recreational impoundments.

The criteria for determining whether recycled water is feasible for a particular property or non-domestic use include the following factors:

- The property is located within an area as defined in the most current version of the District's Master Plan.
- Recycled water may be furnished for the intended use at a reasonable cost to the customer and the District.
- Recycled water is of adequate quality for the intended use and does not require significant additional on-site treatment beyond that required for potable water.
- The use of recycled water is consistent with all applicable federal, state, and local laws and regulations.
- The use of recycled water will not be detrimental to the public health and will not adversely affect plant life, fish and wildlife.

AR 7011.1 Residential dual plumbed water EDU ratio

For residential dual plumbed connections, the District will allocate water EDU's on a 2.5 to 1 ratio (i.e., 2.5 dual plumbed connections = 1 water EDU) in recognition that, based on current demand data, the annual potable water requirement of dual plumbed residential connections is approximately 40% of a full potable connection, including potable supply supplementation of the recycled water system. The District may periodically review and update this allocation based on the then-current demand data.

El Dorado Irrigation District

AR 7012 Construction and Inspection of Facilities

Approved: December 12, 2006

To ensure the health and safety of the public, on-site facilities shall be constructed and inspected to conform to the District's On-Site Facilities Design and Construction Standards and in accordance with the District's Master Reclamation Permit issued by the Regional Water Quality Control Board - Central Valley Region.

The District shall have the ultimate responsibility and authority to monitor and inspect the entire system to ensure and enforce compliance with all applicable standards, regulations, User Reclamation Plans, and Engineer's reports. For these purposes, the District shall have the right to access the customer's premises as required.

AR 7013 Discontinuation / Interruption of Service

Approved: December 12, 2006
Revised: March 20, 2012

It is the goal of the District to provide continuous service and, in the event of a service disruption, to resume service in an expedited manner. When misuse has been established and penalties and fines are not paid or corrective action is not taken within the prescribed time frames, service may be temporarily terminated. Service will be restored when penalties and fines are paid and/or corrections are made.

AR 7013.1 Supply

The District reserves the right to limit the use of recycled water when supplies are limited.

AR 7013.2 Misuse of Recycled Water

Penalties and fines shall be imposed for misuse of recycled water, and the customer will be required to take corrective action as prescribed by the District. Misuse of recycled water includes, but is not limited to, the following:

- Modification or relocation of the meter, which results in nonconformance with District requirements.
- Intentional non-permitted discharges; for example, discharge to surface water or pond overflow.
- Intentional cross connection; for example, connection of the recycled water system to the potable water system.
- Non-approved system installations or modifications; for example, irrigation system modifications that have not been reviewed, approved, and/or inspected by the District, excluding drip systems and sprinkler heads.
- Theft of recycled water; for example, unmetered use of water or meter tampering.
- Non-compliant use of recycled water; for example, use that is not in compliance with the User Reclamation Plan, engineer’s reports, and/or the provisions of Title 22 of the California Code of Regulations.
- Operational non-compliance; for example, system operation that is not in compliance with the site User Reclamation Plan or engineer’s reports such as irrigating outside of the allowable time period.

- Noncompliance with applicant agreement, engineer's reports, or User Reclamation Plans. This applies to the developer or owner of a development who does not follow the specific requirements outlined in the applicant agreement, engineer's reports, and/or User Reclamation Plans.

AR 7013.3 Fines and Penalties

Misuse of recycled water may result in discontinuation of service, penalties, and fines. Penalties and fines paid to the District shall be designated to reimburse operating expenses and/or environmental restoration projects, payment of fines to regulatory agencies, or otherwise according to the District's fines and penalties schedule.

When determining the level of penalty and/or fine, the District will consider all relevant facts and circumstances and may consult with regulatory agencies such as the Department of Health Services (DOHS), Central Valley Regional Water Quality Control Board (CVRWQCB), and/or other resource agencies as appropriate. The District reserves the right to impose fines and penalties in excess of those described above, including possible termination of service, upon a finding of gross negligence or willful misconduct.

A customer may appeal the District's imposition of a penalty and/or fine. Appeals shall follow the procedures of AR 1041.6.

-- THIS PAGE INTENTIONALLY LEFT BLANK -

El Dorado Irrigation District

BP 8000 HYDROELECTRIC SYSTEM

BP 8010 Hydroelectric System Management

Adopted: October 11, 2006
Supersedes: N/A

The District maintains and operates its hydroelectric generating facilities in a safe, efficient, and environmentally responsible manner, and in compliance with all applicable federal and state permits and regulations, the terms of the Federal Energy Regulatory Commission license, and all related agreements. Hydroelectric power generation shall be compatible with the District's consumptive water supply operations.

AR 8010 Priority of Consumptive Water Diversion over Power Generation

Approved: December 12, 2006

The hydroelectric power generation shall be synchronized with consumptive water production with the intentions to maximize power generation. When the General Manager determines there is a conflict between hydroelectric generation and consumptive water production, priorities shall be given to consumptive water production.

AR 8011 Participation in Power Markets

Approved: December 12, 2006

The District shall market its electric generating capacity and energy to the fullest extent possible by using a combination of power marketing strategies, which offer the optimal blend of maximum revenue with acceptable risk levels. Such power markets may include, for example, non-firm energy generated as available, day-ahead firm energy, renewable energy, and ancillary services. The District shall remain up-to-date in regards to electric power marketing strategies, associated risks, and changes.

El Dorado Irrigation District

AR 8012 Emergency Preparedness

Approved: December 12, 2006

The District shall maintain a set of Standard Operating Procedures for the hydroelectric facilities. The SOPs will include emergency preparedness guidelines and recommendations designed to avert the need to invoke an emergency or mitigate the consequences of an emergency.

In addition to the SOPs, the District shall maintain Emergency Action Plans for each of the dams licensed by the Federal Energy Regulatory Commission (FERC). The dam EAPs will be updated periodically and exercised annually by way of either tabletop exercise or a functional exercise.

El Dorado Irrigation District

AR 8013 System Operation

Approved: December 12, 2006

The District shall operate and maintain its hydroelectric system of ditches and powerhouse in a safe and cost-effective manner, in compliance with regulatory requirements and industry standards.

AR 8014 Priority of the Dam Safety Program

Approved: July 10, 2012

The District shall maintain a dam safety program to safeguard the public, the environment, and its hydroelectric facilities. This will be facilitated through the Owner's Dam Safety Program (ODSP), as required by the Federal Energy Regulatory Commission; applicable to the District's high and significant hazard potential dams.

The ODSP shall assure that dam safety is of the highest priority within the District's organization through: acknowledging dam safety responsibilities; promoting internal communication throughout the organization; clearly designating responsibility for maintaining dam safety; allocating adequate resources to dam safety; and continual learning in dam safety.

BP 8020 Additional Generation Opportunities

Adopted: October 11, 2006
Revised: August 10, 2009

The District shall seek to augment its electric energy and capacity revenue stream, and/or reduce its operational energy expenses, by adding new generation facilities whenever they are economically viable.

It is the policy of the El Dorado Irrigation District that resources planning and infrastructure, including water and wastewater systems, emphasize renewable energy and energy efficiency toward a goal of energy independence for El Dorado County and its citizens.

El Dorado Irrigation District

BP 9000 CUSTOMER SERVICE

BP 9010 Customer Service

Adopted: November 11, 2006
Supersedes: N/A

The District strives to meet or exceed customers' reasonable expectations for service through innovative thinking, effective issue resolution, and execution of strategic plans.

AR 9010 Access to Programs, Services, and Facilities

Approved: November 6, 2008

The El Dorado Irrigation District (EID) provides access to its programs, services and facilities to persons with disabilities in accordance with Title II of the Americans with Disabilities Act of 1990 (ADA) (42 U.S.C. §§ 12131-12134), its implementing regulation (28 C.F.R., part 35), and other applicable federal and state laws. The District's Human Resources Director or designee is the initial point of contact for inquiries or complaints regarding accessibility.

El Dorado Irrigation District

AR 9011 Use of District Facilities

Approved: April 22, 2010

District facilities shall be used only for activities that are directly related to or advance the District's mission. The use of District facilities by non-District personnel directly relates to or advances the District's mission if all of the following conditions are satisfied:

- The use is by an organization of which the District or any of its employees is a member.
- The organization's mission or activities are directly related to a business function of the District.
- District personnel are eligible to attend and participate in the activity for which the District facility is being used.
- The activity will further the professional development or personal health of District personnel, or otherwise advance the District's interests.
- The organization has agreed to reimburse the District for any documented District costs incurred solely as a result of the facility use.
- An authorized representative of the organization furnishing the activity has executed a District-approved liability waiver and release form, and the organization has provided satisfactory evidence of insurance coverage in types and amounts reasonably deemed necessary by the District. If the Office of the General Counsel approves, the District may waive any or all of these liability and insurance requirements.

BP 9020 Establishing New Service

Adopted: November 11, 2006
Supersedes: Regulation Nos. 1, 5, 6, 8, 12, 14, 17, 18, 22

The District provides drinking water, recycled water, and wastewater services to residential, municipal, commercial, industrial, and agricultural customers within the District's service area. These services are subject to the provisions of all Board Policies and applicable Administrative Regulations and to the payment of appropriate rates, fees, deposits, and charges.

AR 9021 Eligibility for New Service

Approved: December 12, 2006
Revised: July 24, 2012

When applying for and receiving service from the District, each customer covenants and agrees to be bound by and to comply with all applicable laws, the District's Board Policies and Administrative Regulations, and all terms of signed service agreements.

Except as otherwise indicated in the District's Board Policies and Administrative Regulations, new service will be provided subject to the following conditions:

- The land to be served is within the service area and becomes subject to the indebtedness of the District and annexed to the District.
- The applicant or authorized agent shall make application for service and pay, by cash or check, all applicable water, wastewater, and recycled water connection charges.
- If the property to be served is intended or required to have water, recycled water, and wastewater service, then all services must be listed and paid for in the application process.
- **Raw Water** - Requests for ditch service will be considered only for non-drinking purposes and only if the service ties to the Main Ditch. All raw water connections require the approval of the District's General Manager.
- **Drinking Water** - A District water main of adequate capacity and pressure must exist in a right-of-way abutting a principal boundary of the land to be served, or adequate mains, pumps, and storage facilities (as solely determined by the District) must be constructed in accordance with the District's Board Policies and Administrative Regulations.
- **Recycled Water** - The District requires that customers use recycled water, wherever feasible, for future non-domestic purposes when it is of adequate quality and quantity, available at reasonable cost, not detrimental to public health, and not injurious to plant life, fish, and wildlife. In general, the lands subject to mandatory recycled water use are as defined in the most current version of the District's Recycled Water Master Plan.
- **Wastewater** - A sewer main of adequate capacity must exist in a right-of-way abutting a principal boundary of the land to be served,

or adequate wastewater facilities, including lift stations and collection facilities, must be constructed in accordance with the District's Board Policies and Administrative Regulations.

- **Commercial Private Fire Service** - A private fire service is required for commercial customers who request water for fire suppression other than from public fire hydrants. The principal boundary of the property must abut a District water main of adequate size, capacity, and pressure, unless the applicant receives prior approval from the District. The District does not guarantee any range of pressure or rates of flow and is not liable for damage to the private fire service because of water pressure. The District reserves the right to require a metered service be installed and to disconnect a private fire service if water is taken through the detector check assembly for any use other than fire suppression. The District is not liable for any loss or damage due to such action. *See Administrative Regulation 5014 for more information on commercial and residential fire suppression services.*
- **Small Farm Irrigation and Agricultural Metered Irrigation Service -** To qualify for small farm or agricultural metered irrigation service rates, users must meet all of the requirements set forth in AR9024.

AR 9021.1 Failure to apply for service

Anyone using water, wastewater, and recycled water services without having applied to the District shall be held liable for these services from the date of any previous meter reading that most nearly coincides with the actual date the services were first used.

AR 9021.2 Acceptance of application(s) for service

The District will accept applications for water, recycled water, and wastewater services after determining that all conditions of eligibility have been met. For acceptance, applications must be accompanied by all supporting documentation requested by the District. The District's acceptance of an application for service is not a guarantee that a service connection will be made or service provided.

In compliance with Government Code section 65589.7 or its successors, District staff shall prioritize the processing of applications for service made by developments that include housing units affordable to lower income households.

No service connection will be made if it is found that actual conditions or operation of facilities would violate the District's Board Policies, Administrative Regulations, and *Water, Sewer and Recycled Water Design & Construction Standards*.

AR 9022 Payment of Service Connection Charges

Approved: December 12, 2006

Applicants who meet District requirements for service shall pay a facility capacity charge (FCC) for each service connection. This and all other appropriate fees, surcharges, and inspection and construction costs, if any, must be paid in full prior to receiving service. Payment shall be made by the owner of the property benefiting from the service or by others with the owner's written consent and permission.

AR 9022.1 Refunds and transfers

Once paid, fees, application costs, FCCs, and surcharges are not refundable except if the County/City nullifies or modifies a proposed project. The applicant must provide appropriate documentation of the change or modification, and the District will deduct the appropriate administrative fee from the refund.

Once paid, application costs, FCCs, and surcharges cannot be transferred except if a boundary line adjustment reduces the water demand for a second service, the County/City modifies a project, or the County/City certifies the lot as unbuildable. All transfers must be under the same ownership and must obtain approval from the lien holder prior to the transfer. Verification from either the City or the County will be required if a project is modified or the lot is deemed unbuildable. All transfers are subject to the District’s Board Policies and Administrative Regulations in effect at the time the transfer is approved. Any applicable FCCs or meter relocation fees must be paid in full prior to approval of the transfer.

AR 9022.2 Fee Deferral for Affordable Housing

Single-family or multi-family development projects that meet affordable housing criteria for persons and families of low or moderate income, as defined by California Health & Safety Code section 50093 and related enactments, or their successors, may be eligible to defer the payment of FCCs and associated fees otherwise owed to the District at the time of the issuance of a building permit by the local building official. The maximum fee deferral period will not exceed 12 months, and the District will not issue, install or certify water, sewer or recycled water meters or connections until the FCCs and associated fees are paid in full.

AR 9022.2 Fee Deferral for Affordable Housing (continued)

As a condition of the request for deferment of fees, the property owner will execute an Agreement to pay the fees. The Agreement will be in recordable form, and upon recordation by the county recorder shall constitute a real property lien for the payment of the fees which shall be enforceable against successors in interest to the property owner. Interest (equal to the prevailing prime lending rate on the date the Agreement is signed, plus 2%) will be charged on all amounts deferred and will accrue from the date the Agreement is signed.

AR 9023 Non-Standard Service

Approved: December 12, 2006

When in the sole determination of the District satisfactory service cannot be supplied from District mains because of elevation, location, or other factors, the District reserves the right to refuse service or to require the applicant to provide a written release from liability for any damages or inconvenience that may occur by reason of insufficient pressure, inadequate volume, or intermittent supply. Applicants must, at their own expense, provide private pipelines, storage facilities, and/or pumping plants sufficient to meet their needs.

El Dorado Irrigation District

AR 9024 Small Farm and Agricultural Metered Irrigation (AMI)

Approved: December 12, 2006
Revised: July 13, 2012
Revised: August 20, 2013
Revised: July 14, 2014
Revised: November 4, 2014

To qualify for small farm or agricultural metered irrigation service rates, users must meet all of the requirements under the appropriate category below. Users whose intent is to farm but do not meet eligibility requirements for the Small Farm Irrigation or AMI rate, or who have not begun development, will be placed on the appropriate rate until they meet eligibility requirements.

The right to the Small Farm or AMI rate is not perpetual and does not run with the land. In the event the property changes hands or the qualifications are not being met, the District reserves the right to change the rate to the appropriate rate (for example, Single Family Residential) until such time as the customer can meet the eligibility requirements.

Small Farm Irrigation Eligibility Requirements:

- Minimum parcel size is one (1.0) acre per County Assessor's Office records
- Minimum ½ acre planted agricultural crops and/or qualifying livestock as a marketable product in accordance with county zoning
- Maintenance of the crop to produce a marketable product
- Submission of one of the following: 1) valid Certificate of Compliance from the El Dorado County Department of Agriculture, or 2) current appropriate IRS form that shows at least $3,500 annual gross income in "agricultural products of the lands"
- The Small Farm rate will remain in effect for the customer and time period stated on the Certificate of Compliance. The rate will remain in effect for three years for customers who submit an appropriate IRS form.

Agricultural Metered Irrigation (AMI) Eligibility Requirements:

- Minimum 10.0 acres of irrigated pasture or a minimum of 5.0 acres planted orchards, groves, vineyards or other horticultural pursuits with acreage determined by the El Dorado Department of Agriculture's guidelines for measuring crops

- The AMI rate will remain in effect until there is a change in ownership or the property no longer qualifies for the rate. Surveys may be performed at the District's discretion to ensure the property meets the eligibility requirements.

For customers on an AMI rate, one meter may be installed to serve multiple parcels under the same ownership. The owner must provide sufficient county recorded documentation of ownership. Facility Capacity Charges (FCCs) will not be assessed on the additional parcel, but applicable billing unit charges will apply. When landholdings are under the same ownership, the meter remains with the original parcel or nearest new parcel if the landholdings are modified or sold. Liens are to be placed on each commonly owned parcel, and when a title change occurs, all other parcels under separate ownership will be required to obtain a new water meter, conform to all Board Policies and Administrative Regulations, and pay the FCCs in place at the time of purchase.

AR 9025 Authorized Use of Water

Approved: December 12, 2006
Revised: August 20, 2013

The sole use of water furnished by the District shall be on the parcel that is specified in the customer's application for service. Water furnished by the District to a residential premise may not be resold (for example, multiple dwellings on a master meter), except by the City of Placerville.

The District also provides temporary water use for authorized projects in three ways. Refer to AR 9073 for Temporary Water Use meters.

AR 9026 Water Meters

Approved: December 12, 2006
Revised: August 24, 2012

All delivered water will be measured by appropriate metering devices as determined by the District. Meters will be installed in full compliance with the District's Board Policies, Administrative Regulations, *Water, Sewer and Recycled Water Design & Construction Standards*, and payment of all appropriate connection charges.

At the time of application, the customer is responsible for selecting the appropriate meter size for the service being requested and for applying for a change in meter size if needs change over time. The District may reevaluate the meter installation and require a different size or type meter based on historic use or flow restrictions.

A single water connection and meter will be established for each parcel of land under separate ownership or that is separately described in the County records. No more than one parcel shall be serviced through a single meter, with the exception of agricultural accounts, where one meter may be installed to service multiple parcels under the same ownership. *(See AR9024).*

District meters will be situated in easily accessible locations immediately adjacent to or within the owner's parcel on the principal boundary of the property abutting a right-of-way satisfactory to the District. Exceptions to this requirement are authorized when the District's main does not conform to the perimeter boundaries of a parcel or lie within a right-of-way or vehicular access easement.

For community property, one meter may be installed to serve a parcel of land owned by a home owner's association, such as a condominium, planned unit development or mobile home park, subject to a responsible entity entering into a contract with the District regarding payment of fees and conditions of service. Master location meters and sub-meters *(See AR 9027)* may be installed and used to meter commercial landscape irrigation on community property.

Meters are maintained by the District. Customers are responsible for all repairs to their systems on their sides of the meters. There is a one-year warranty on the gate valve starting from the time of installation regardless of the status of occupancy of the property. Customers are liable for meter repair costs if the District determines that repair work was required as a direct result of excessive wear beyond meter design flow standards or other physical damage to the meter.

AR 9027 Sub-Meters

Approved: December 12, 2006
Revised: January 10, 2013

Sub-meters may be used as follows:

- To meter permanent or long-term commercial establishments that exist in separate buildings or permanent portions of a building;
- To meter commercial landscape irrigation;
- To meter mixed-use developments;
- To meter uses in parks and other facilities of public agencies; and
- To meter any other uses, as reasonably deemed feasible and appropriate by District staff.

AR 9028 Extension or Improvement of Facilities

Approved: December 12, 2006
Revised: January 10, 2013
Revised: April 1, 2013

When water, recycled water, and wastewater services are requested for property that is within District boundaries but does not abut a District water or sewer main with adequate capacity, the District may require an extension or improvement of the District's distribution system. Any improvements or extensions will be paid for by the applicant and must be designed and constructed to meet the District's then-applicable *Water, Sewer and Recycled Water Design & Construction Standards* and when completed, must generate revenues equal to or greater than the costs of staff, equipment or material necessary to operate the facility, plus general and administrative costs. The applicant will have the facilities designed by a licensed professional engineer with experience in the design and construction of the same type of system(s), and installed by an experienced, competent, and licensed contractor. Upon completion and after inspection and acceptance by the District, the facilities shall then be owned and operated by the District.

Extensions or improvements include but are not limited to water, recycled water, and wastewater mains, storage facilities, pump stations, pressure reducing stations, treatment facilities, lift stations, fire hydrants, and all appurtenances.

Design of the facilities shall be in accordance with accepted engineering practices, current AWWA standards, and in compliance with the District's *Water, Sewer and Recycled Water Design & Construction Standards*. Improvement plans will be approved by the District Engineer or his/her designee. All facilities shall be installed in accordance with plans and specifications that have been approved by the District and are in conformance with the District's design standards, noted above, as they exist at the time of approval.

AR 9028.1 Facility Capacity Charge (FCC)

The District will not pass on to the existing customer the incremental cost for expansion of utility facilities and service to provide for growth. Expansion of District facilities to provide capacity for new development will be financed by facility capacity charges assessed to the developers. The extension of utility lines to the development will be engineered and financed by the developer.

AR 9028.2 Inspection and acceptance

District staff will inspect the construction of all new District facilities. The District will not accept or provide regular permanent service through a facility that has not been inspected and accepted.

The District will accept the project upon completion of the construction and successful testing, final inspection by the District, submission of as-built drawings acceptable to the District and all other required documentation, and payment of any outstanding monies due. The facilities shall be owned, operated, and maintained by the District except as specified below:

- Water service line from meter to building or end use
- Recycled water service line from meter to end use
- Wastewater service lateral from the cleanout located at or near the public utility easement line, or in the absence of such a cleanout, the public utility easement line itself to building or end use
- Commercial fire sprinkler line from check valve vault to building

AR 9028.3 Payment of costs

Applicants for extension or improvement of facilities shall pay the District's actual costs including but not limited to engineering analysis, designs, plan checks, preparation of environmental impact documents, hearings, reviews or preparation of improvement plans, construction inspections, as-built drawings, project administration, and usual overhead expenses allocated to such work.

AR 9028.4 First-year warranty responsibilities

For a period of one year from the date of acceptance by the District, the property owner shall warrant for the repair of all defects, leaks, or failure occurring in the facilities that are, as determined by the District, due to negligence in the manufacture and/or installation of the facilities, exclusive of operation of the system by the District, its agents, or natural disasters. Failure by the property owner to pay for any of these repairs after being billed by the District will result in the District placing a lien against the property.

When the facilities serve a residential subdivision, the applicant or the applicant's contractor shall submit a one-year repair surety, which may be a bond , certificate of deposit, or irrevocable letter of credit (in form acceptable to the District) in an amount not less than ten percent of the construction costs of the facilities.

AR 9028.5 Reimbursement for extension and/or improvement

Property owners who extend or improve District water, wastewater, and/or recycled water facilities may qualify for reimbursement of costs, in whole or part, from the District, later users of the facilities, or a combination of the two pursuant to a written agreement with the District. The applicant for reimbursement shall prepare estimates of construction costs and potentially benefitted parcels at its sole expense, for the District's review and determination of reimbursement eligibility. All reimbursements shall be made in arrears as sufficient funds become available to the District. All reimbursements shall be limited to actual, documented and District-approved costs incurred by the application prior to reimbursement.

AR 9028.6 Letters issued by the District

Facility Improvement Letter - The District will issue a Facility Improvement Letter for water, wastewater, and/or recycled water services to applicants requesting service to existing parcels, lands being subdivided, and lands being rezoned or involving petition for amendment to the County or City general plans. The Facility Improvement Letter will be valid for three years from the date of issuance. This document will state the current availability of service and the ability of the District's existing system to provide the requested service. The District may require the submittal of a Facility Plan Report for approval if deemed necessary because of project size or complexity. An extension of up to one year for the Facility Improvement Letter may be granted upon request and submittal of the appropriate application and fee.

Meter Award Letter - The District will issue a Meter Award Letter to eligible applicants once all District requirements have been met, the applicant has complied with all construction and maintenance bonding requirements, and all of the following have been received by the District:

- Facility Improvement Letter
- Approved Facility Plan Report, if required
- Extension of Facilities application and fee, if required
- Environmental documents
- Payment of all applicable water, wastewater, recycled water and other connection fees
- Approval of Annexation, if required
- Agreements approved and signed by the EID Board of Directors
- Land rights being or guaranteed to be conveyed to the District

- All Engineered Improvement Plans approved by the District Engineer and payment of associated fees

Status Letter - Upon request, the District will issue a letter to eligible applicants meeting the following conditions:

- Water, wastewater, and/or recycled water improvements have been completed and accepted by the District (Notice of Completion issuance)
- Applicant has supplied the District with parcel numbers, lot numbers, and addresses for each parcel.

AR 9028.7 Exceptions to extension or improvement of facilities requirements

Water, wastewater, and recycled water services that meet all of the criteria listed below may request variance from the requirement for extension or improvement of facilities.

Criteria for a temporary off-site metered connection for domestic water:

- The property does not front a District water main extension.
- An upgrade to District facilities is not required to provide a minimum level of service as defined in the District's Design and Construction Standards. The parcel to be served shall be located within 1500 linear feet (measured along the path of the service line) from a water line that has capacity and meets the District's minimum line size criteria, as determined by the District Engineer or their designee.
- The property applying for off-site service has been or will be developed as a single family residence. Off-site meters shall not be authorized for the purpose of subdividing residential properties.
- For new single family residential projects, the applicant provides written verification from the appropriate fire district indicating that the fire protection district will not require the installation of a new public fire hydrant. The applicant also provides a letter from the El Dorado County Building Department indicating no objection to the installation of an off-site water meter and private service line.
- The property owner enters into an "Off-site Service Agreement."
- District staff reasonably determines that an extension of facilities to the property would not be in the best interest of the District or surrounding properties.
- For properties applying for off-site service on the basis of hardship, documentation of well failure issued by a certified well company must be provided. District staff shall make hardship determinations on a case-by-case basis.
- The applicant provides a copy of a properly recorded minimum 10-foot easement allowing the property owner to install, operate, maintain, repair, and

replace the private service line, extending from the public water main up to the property to be served. All proposed and recorded easements are subject to the review and approval of District staff prior to the issuance of a water meter.

- All approved offsite water services will be required to install backflow protection. The protection shall be a minimum of a Reduced Pressure Principle Backflow Prevention Assembly (RP).

Approval for a temporary off-site connection will expire twenty-four months from approval if the applicant has not signed an agreement or submitted payment of all applicable fees for the meter.

Criteria for private wastewater service:

- District staff reasonably determines that an extension of facilities to the property would not be in the best interest of the District or surrounding properties.
- A system improvement is not required to provide a minimum level of service.
- The property owner enters into an "Off-site Service Agreement."
- The private wastewater line shall be constructed by the property owner in accordance with District standards and shall be inspected by the District. Subsequent maintenance and repair is the responsibility of the property owner.
- The applicant provides a copy of a properly recorded minimum 10-foot easement allowing the property owner to install, operate, maintain, repair, and replace the private service line, extending from the public sewer main up to the property to be served. All proposed and recorded easements are subject to the review and approval of District staff prior to the issuance of a water meter.

AR 9028.8 Land rights schedule

The applicant shall provide all land easements and right-of-way to the District as follows:

- **Non-subdivision and minor land division:** prior to signing improvement plans
- **Subdivision, off-site:** prior to signing improvement plans
- **Subdivision, on-site:** prior to recording final map, or dedicated by the map

-- THIS PAGE INTENTIONALLY LEFT BLANK -

El Dorado Irrigation District

AR 9029 District Access to Facilities

Approved: December 12, 2006

When applying for and receiving service from the District, customers authorize appropriate District employees and agents to enter their properties at reasonable times for the purpose of reading, inspecting, testing, checking, repairing, maintaining, or replacing the District's meters, backflow prevention devices, and other equipment and facilities. Any fences or other structures that restrict access to new or existing District facilities shall have proper gates or other means to permit reasonable access to the facilities.

BP 9030 Annexation of Land to the District

Adopted: November 11, 2006
Supersedes: Regulation No. 23

The District has the authority to annex property to benefit the operations, management, and implementation of District functions. The General Manager and/or the General Counsel and their designees may represent the Board of Directors in negotiations. It takes a majority vote of the Board to approve all annexations.

AR 9031 Application for Annexation

Approved: December 12, 2006

The District will accept an application for annexation upon determining that all conditions of eligibility have been met and appropriate fees have been paid. A Facility Improvement Letter is a prerequisite to acceptance of an annexation application and will determine if extension to District facilities will be needed.

Annexation of land to the District provides the potential for drinking water, recycled water, and/or wastewater services, but does not guarantee that these services will be available when requested.

If the annexation is not authorized to proceed, the proposal terminates and the applicant must wait one year to apply again.

El Dorado Irrigation District

AR 9032 Recording of Annexation

Approved: December 12, 2006

Before an annexation is recorded with the Local Agency Formation Commission (LAFCO), the impact fee must be paid. The impact fee is an incremental fee to establish a measure of equity between lands that supported the payment of voter-approved debt for the construction of water conveyance facilities. If the annexation is terminated, the impact fee is refunded, and no accrued interest is paid to the applicant.

BP 9040 Improvement and Assessment Districts

Adopted: November 11, 2006
Supersedes: Regulation No. 19

The District may establish Improvement Districts to benefit District operations, capital facility planning and funding or other implementation of District functions. The General Manager and/or the General Counsel and their designees may represent the Board in negotiations. It takes a majority vote of the Board to approve all improvement and assessment districts.

BP 9050 Payment for On-going Service

Adopted: November 11, 2006
Supersedes: Regulation Nos. 5, 15

The District's Board of Directors establishes charges and rates for water, recycled water, and wastewater services.

AR 9051 Billing

Approved: December 12, 2006

Billings will be sent periodically as established by the Board. All billings will be delivered to the United States Postal Service. The property owners are responsible for keeping the District advised of the correct address where bills are to be mailed. All accounts will remain in the property owner's name. Property owners may request that a bill be mailed in care of a tenant or renter, providing the District receives a completed Owner/Tenant Agreement. This agreement does not release the property owner from responsibility for any unpaid charges. Tenants or renters who contact the District regarding shut-offs or other matters concerning service will be referred to the property owner. However, if a tenant or renter wants to pay a bill to avoid an interruption in service, the District will accept payment and credit the account. Non-receipt of a bill does not relieve a customer of any payment obligation to the District.

AR 9051.1 Minimum bills

The District requires all metered accounts to be billed on a regular basis for water, recycled water, and wastewater services and any applicable surcharges from the date the meter is installed. This includes accounts with no usage.

If a meter fails to register correctly, cannot be read, or is not read during the billing cycle, the bill will be based on the District's estimate of the quantity of water delivered as an average of past water usage or will consist of the minimum base charges, taking into consideration seasonal water demand and any other factors that are material and significant in arriving at a fair charge.

Bills will be pro-rated for commencement or termination of service based on the number of days of service during the billing period.

Residential wastewater rate calculations are performed annually, based on water consumption that occurs during the two-month winter billing cycle. For new customers, the lesser of the flat rate or first full billing cycle will be used until a winter billing cycle is established.

AR 9051.2 Disputed bills

Any request for investigation of a disputed bill must be made in writing. The fact that a bill may be in dispute does not justify non-payment. The bill shall be paid in full when due, while investigation and settlement of the dispute proceeds. If the District determines there has been a calculation error, the District will recalculate the charges back one year and apply an adjustment to the customer's account.

AR 9051.3 Bill adjustments

Leak Adjustments

The District may credit accounts if excessive delivery is the result of water leakage that occurs from underground or unexposed pipes beyond the discharge flange of the water meter. Credits will not be given when there is visible leakage, such as leaks from faucets, toilets, sprinklers and hose bibs or for wasteful use or the customer's acts, omissions or negligence.

The District must receive the request for credit in writing within 60 days from the bill date of the bill that reflects the leakage. An adjustment will only be made after leaks have been repaired and it is reasonable to predict that the leak or loss will not occur again. The customer must submit repair receipts for verification that the leak has been repaired. Adjustments are for a single billing period and no more than one adjustment will be made to the same customer for the same premises in any five-year period.

When the District determines an adjustment is warranted, one-half (1/2) of the billed water costs in excess of the amount billed the previous year during the same billing period will be credited. If billing history has not been established for the same billing cycle for the previous year, the average of the water costs billed the previous six (6) billing cycles will be used. If the customer requesting the leak adjustment at the property where the leak occurred has not established usage history for six (6) billing cycles, the customer account is ineligible for an adjustment.

Residential Sewer Commodity Adjustments

The District may adjust accounts if excessive delivery is the result of water leakage that occurs from underground or unexposed pipes beyond the discharge flange of the water meter. The District will also take into consideration the filling of pools, and irrigation issues. Credits will not be given when there is visible leakage, such as leaks from faucets and toilets or for wasteful use or the customer's acts, omissions or negligence.

The District must receive a Sewer Commodity Adjustment Request form within 60 days from the bill date of the bill that reflects the leakage. An adjustment will only be made after leaks have been repaired and it is reasonable to predict that the leak or loss will not occur again. The customer must submit repair receipts for verification that the leak has been repaired. Adjustments will be made for the initial billing period and be effective through the next winter billing period. No more than one adjustment will be made to the same customer for the same premises in any three-year period.

In most instances where a leak has occurred, staff will use the previous year's winter average usage to calculate the adjustment. If a customer moves to another location, the lesser of the flat rate or first full billing cycle will be used until a winter billing cycle is established.

Commercial Sewer Commodity Adjustments

The District may adjust accounts if excessive delivery is the result of water leakage that occurs from underground or unexposed pipes beyond the discharge flange of the water meter. The District will also take into consideration any water usage that did not transfer into the District's wastewater system such as the filling of pools, and irrigation issues. Credits will not be given when there is visible leakage, such as leaks from faucets and toilets or for wasteful use or the customer's acts, omissions or negligence.

The District must receive a Sewer Commodity Adjustment Request form within 60 days from the bill date of the bill that reflects the leakage. An adjustment will only be made after leaks have been repaired and it is reasonable to predict that the leak or loss will not occur again. The customer must submit repair receipts for verification that the leak has been repaired. Adjustments are for a single billing period and will be calculated using last year's usage during the same billing period at the District's current rate. No more than one adjustment will be made to the same customer for the same premises in any one-year period.

AR 9051.4 Billing errors

If during an audit of customer accounts an error in a billing calculation or failure to bill for service is discovered, the District will calculate the amount of credit or additional charges to the customer's account, but will only calculate corrections back one year. All back billing issues will be monitored on a case-by-case basis. Customers will be notified in writing of changes to their accounts.

AR 9052 Payment

Approved: December 12, 2006

Bills are due and payable on mailing or presentation. Payment shall be made to the District’s business office or to a collector authorized by the District.

AR 9052.1 Late payment charge

The District will impose a late payment charge on a balance of $10.00 or greater if not paid five working days past the delinquent date.

AR 9052.2 Returned checks

A returned check fee shall be paid for each check tendered as a payment to the District that is returned unpaid after negotiation by the District.

AR 9052.3 Charges against deposits

The District may charge any unpaid bills against any deposit made by the party liable for the bill.

AR 9052.4 Payment arrangements

Payment arrangements will be extended to customers. If a customer defaults on a payment arrangement, the account must be brought current prior to extending the payment arrangement. If a customer defaults twice within six months, payment arrangements will not be extended until the account is in good standing for six months. If a customer defaults three times within a 12-month period, payment arrangements will not be extended until the account is in good standing for 12 months. Payment arrangements will not be extended to customers who have defaulted on payment arrangements more than five times in an 18-month period.

Customers who receive a 48-hour notice may be extended payment arrangements. If customers default on this arrangement, a District employee will disconnect service, and an appropriate fee will be charged for reconnection.

AR 9053 Active Delinquency

Approved: December 12, 2006
Revised: July 25, 2008
Revised: August 20, 2013

When a customer's account becomes delinquent, the District will send a Past Due Notice by mail and give the customer an additional 10 days to make payment, including the appropriate late fee, prior to the termination of service. If the District does not receive payment or the customer does not make satisfactory payment arrangements within the 10 days, the District will send a Disconnect Notice to the customer by mail and assess a disconnect notice fee. At least 24 hours prior to the termination of service, the District will attempt to contact by telephone an adult person residing at the premises of the customer to notify them of the pending termination of service. If, prior to the date set for termination of service, payment has not been received by the District or payment arrangements made by customer with District, a District employee will be dispatched to disconnect service. The customer will at that time be charged appropriate fees by the District to cover the field costs of the delinquency. Disconnection of service for delinquency in payment will not occur on a Saturday, Sunday, legal holiday, or when the District's business office is closed to the public.

Additionally, service will not be terminated under the following conditions: (a) during a pending investigation by the District of a customer dispute or complaint concerning the service at issue; (b) when the customer has been granted an extension of time by the District for the payment of the bill at issue; (c) on the certification of a licensed physician that to do so will be life threatening to the customer, and the customer is financially unable to pay for service within the normal payment period but willing to enter into a payment arrangement with the District for all charges the customer is unable to pay prior to delinquency; or (d) for an account serving a multi-unit residential structure or mobile home park, when a public health or building official certifies that termination would result in a significant threat to the health or safety of the residential occupants or the public.

AR 9054 Liens

Approved: December 12, 2006

The District will file liens in accordance with Section 25806 of the Water Code of the State of California against the properties of customers who fail to pay the District for service provided.

Once a customer's service has been disconnected or payment for a vacant property is delinquent, the customer will be sent a 30-day lien notification. The notification states that if payment is not received within 30 days, a lien may be placed against the property. Once the lien is recorded, the customer will receive notification of the lien and will be informed that if payment is not made by July 1 of the following year, the lien may be assessed to the property owner's property taxes.

AR 9055 Collections

Approved: December 12, 2006
Revised: June 15, 2014

Accounts that are closed and remain unpaid after a final bill has been issued are subject to collection notifications. Once a final account is 30 days delinquent, a notification letter is sent informing the customer of the District's collection process. If the account remains unpaid, 60- and 90-day delinquent notification letters will be sent. After the 90-day period, the District sends the account to a collection agency or transfers the delinquent balance to another account owned by the customer. Once the account is submitted to a collection agency, the District cannot collect payments for the account. The customer must contact the collection agency to make payment. Once a payment is received by the District from the collection agency, the account will be removed from collections.

BP 9060 Discontinuance of Service

Adopted: November 11, 2006
Supersedes: Regulation No. 4

The District strives to maintain service to customers to the maximum extent possible. However, under specified circumstances where District policies and/or procedures and regulations are violated, notification of potential disconnection will be provided and discontinuation of service may follow, pursuant to District administrative regulations.

.

AR 9061 Disconnection or Discontinuation of Service

Approved: December 12, 2006
Revised: July 25, 2008

Failure to comply with applicable laws and the District's Board Policies and Administrative Regulations is sufficient cause to discontinue service until full compliance has been made.

The District reserves the right to disconnect any connection to its water, recycled water, and wastewater systems for any of the following reasons:

- The District determines a condition exists that is hazardous to the health and safety of the public.
- The customer fails to comply with any of the District's policies, administrative regulations, standards, or procedures.
- The service is being furnished without a proper application or under a false or fraudulent application.
- There is evidence of unlawful tampering or interference with District facilities by the customer.
- The customer fails, after notice from the District, to remove an obstruction that prevents EID employees from reading a meter.
- The District finds flagrant wasting of water, and the customer does not correct the problem within the specified period of time.
- The customer fails to pay bills or does not comply with bill payment plans.

Notification of potential disconnection for failure to pay bills or to comply with bill payment plans will be given in accordance with AR 9053. The timing and form of notification of potential disconnection for any other reason will be as deemed appropriate by the District depending upon such factors as, for example, the immediacy of the hazard to public health and safety.

AR 9061.1 Customer Notifications of Interruption of Service

Whenever possible, advance notice of interruption of service will be given to all customers who will be affected. This notice will be in the form of a door hanger, automated telephone message, web site message, notification through the media, or other means deemed appropriate by the District.

In the event of a natural disaster or other emergency, the District follows the procedures for public notification outlined in its Emergency Response Plan.

AR 9062 Cancellation of Service by the Customer

Approved: December 12, 2006

Service will be terminated on any business day (not a Saturday, Sunday, or legal holiday) at the customer's request provided that the request is received by the District no later than three business days prior to the date of termination. The customer will be responsible for bills related to all service furnished by the District prior to notification of the termination of service.

The District will not disconnect service for eviction purposes. Customers requesting a temporary termination of service will be informed that they may shut off water at their valve.

El Dorado Irrigation District

AR 9063 Reinstatement of Service

Approved: December 12, 2006
Revised: November 5, 2014

Customers requesting that their service be restored shall pay a field service call fee, any delinquent charges, and any applicable service charges before service is restored.

An additional standby charge may be assessed if a standby technician is requested to restore the service after hours. If service is restored after hours and payment has not been received, the service may subsequently be disconnected and additional charges may apply.

BP 9070 Additional Services

Adopted: November 11, 2006
Supersedes: Regulation No. 6

The District may provide additional services when beneficial to the District's business.

AR 9071 Additional Services

Approved: December 12, 2006

The District provides additional services to existing and potential customers, developers, and the general public when the District determines that the service is necessary, reasonable, and in alignment with the District's mission. The provision of supplemental services is subject to the District's Administrative Regulations and the payment of appropriate deposits, rates, fees, and charges.

AR 9072 Underground Service Alert (USA)

Approved: December 12, 2006

EID will respond to Underground Service Alert (USA) requests that are within the District's service area. In compliance with northern and central California's "Call Before You Dig" program, anyone other than the District who will be digging must notify USA two working days prior to the start of this work. USA will assign a ticket number to the requester and then contact the District to provide one of the following services:

- mark or stake the horizontal path of the District's underground facilities,
- provide information to the requester about the District's underground facilities, or
- advise the requester that the District does not have underground facilities in conflict with the specified digging.

The ticket issued by USA will be active for a 28-day period. The District will not perform a utility locate service if the ticket has expired. The requester is also required to notify USA, not the District, at any time that the field markings are no longer reasonably visible.

AR 9073 Temporary Water Use Program

Approved: December 12, 2006
Revised: December 20, 2012
Revised: August 20, 2013

All withdrawals of water from temporary connections must use District-provided hardware. The District provides temporary water use for authorized projects in three ways. Connections are authorized and established upon receipt of a signed agreement (permit) and payment of all appropriate deposits, fees, and charges.

- **Card lock bulk water stations**. The card lock water stations provide water to customers with prepaid cards that are available at the District office. A straight commodity charge is applied to water from these stations. There is a fee for the cash card and no recurring fees or charges. The cards are reusable and should be treated as cash.

- **Interim bulk water stations**. These bulk water stations require the user to have an approved permit and a key to allow access to the stations. A daily fee is charged to users to draw water from these stations. There is a fee to obtain a permit to set up an account and users are billed bi-monthly for the daily fee. There is also a charge for lost keys. There is no commodity charge for water drawn from interim bulk water stations. These stations will be replaced with card lock bulk water station at the District's earliest opportunity.

- **Fixed meter**. These meters are located at the closest approved fire hydrant or blow-off to a customer project. The customer must have an approved permit for the District to set the hardware at the requested location. The customer must provide a hardware deposit to the District and will pay a fee to set up the account, a daily rental fee, and commodity water charges.

Failure to adhere to these requirements will result in the assessment of a financial penalty against the applicant and/or a prohibition on current or future use of temporary water use hardware.

El Dorado Irrigation District

BP 10000 RECREATION

BP 10010 Authority and Enforcement of Park Regulations

Adopted: November 13, 2006

BP 10010.1 Authority

The District is committed to the health and safety of visitors and District employees at all EID recreation facilities and to the protection of District recreation properties.

BP 10010.2 Enforcement

Board policies, rules, and regulations shall govern and apply to all visitors and District employees at EID recreation facilities.

EID recreation staff are authorized and empowered to enforce District rules and regulations for all District-owned, -operated, and -leased recreation facilities as well as state and local codes related to safe use of those facilities. Staff may issue citations for violations and eject or exclude any violator as specified in the Park Operations Manual.

El Dorado Irrigation District

AR 10011 Recreation

Approved: December 12, 2006
Revised: January 3, 2013

AR 10011.1 Recreation Access

Use of the Districts recreational lands is a privilege. Recreational use privileges may be revoked at any time for violations of Federal, State, County, or District laws, or rules; non-payment of fees; behavior that endangers people, animals, or facilities; or behavior that diminishes the recreational experience of others.

Trespassing- Visitors shall not trespass on recreation property or use recreation facilities during hours not posted for public use and/or when an entrance gate is closed and locked. Anyone entering during off-use hours may be charged with defrauding an innkeeper. All visitors must display proof of payment or a valid permit.

Selling or Soliciting - Visitors shall not engage in soliciting, selling, or peddling any good or services or distribute any circulars in the areas without prior approval of the District.

AR 10011.2 Fees

Fees are subject to change, based on staff evaluation of similar facilities and services.

AR 10011.3 Annual Permits

Annual permits for day use and boating are subject to availability and valid only during posted day use hours. Annual permit period is based on a calendar year. Permit stickers must be attached to the driver-side mirror or exterior windshield, on the vehicles for which they were purchased, to be valid.

AR 10011.4 Vehicle Use

Vehicle Speed Limit - Visitors shall not operate any vehicle in excess of the posted speed limit, which is a maximum of 15 mph on recreation roads and 5 mph in campgrounds. No visitor shall drive a vehicle within any EID recreation area other than in a reasonable and prudent manner and with due regard for traffic and road conditions. In no event shall a vehicle be driven at a speed that endangers the safety of persons, property, or wildlife.

Drivers' Licenses - Visitors shall not operate any type of motorized vehicle on park properties without possession of a valid driver's license for the vehicle.

Roadway Rules - Vehicles shall be operated only on designated roadways and parking areas. Motor vehicles, bicyclists, and other recreational users shall share the roadways within any EID recreation area.

Vehicle Washing and Repair - Persons are prohibited from washing, repairing, and cleaning any vehicles within recreation boundaries.

Vehicle Parking - Visitors shall not illegally park a vehicle within EID recreation boundaries without authorization by the District. The District reserves the right to tow—at the expense of the vehicle's owner—any illegally parked vehicle and vehicles that block gates in the park or campgrounds.

Motorized wheelchairs and mobility devices – Persons with mobility disabilities may use motorized wheelchairs and mobility devices in defined pedestrian areas and developed camping and recreational facilities, and on any trails designated and signed as disabled accessible. Persons utilizing these devices are encouraged to consult with staff in advance regarding safety and accessibility issues.

Electric Vehicle/Golf Cart Use - Electric vehicles and golf carts within park boundaries shall strictly obey all State and local vehicle operation statutes, codes, and regulations. Such vehicles shall operate only on designated roadways and obey all of the rules listed in these administrative regulations.

Motorized Scooters - Motorized scooters are not allowed.

AR 10011.5 Boat Use

Boats are allowed during day use hours. Boat operators shall comply with California boating laws, the *ABC's of California Boating Laws* and all posted rules. Use of boat docks is restricted to loading or unloading only. Loitering, fishing, diving, and swimming on or around boats docks is prohibited.

Specific Jenkinson Lake Boat Restrictions - Personal watercraft (Jet Skis, sea doos, etc.) are not permitted on Jenkinson Lake.. The maximum number of boats, excluding the mooring facility, allowed on Jenkinson Lake is 101. Maximum speed limit is 35 mph. A counter-clockwise boating traffic pattern is required.

Islands are off limits. Unloading and exchanging of occupants on the islands in Jenkinson Lake are prohibited.

Specific Caples Lake Boat Restrictions – Maximum speed 15 mph. Alpine County restricts boating speed limit to 15 mph on all lakes within Alpine County.

Specific Forebay Reservoir Restrictions – Boats of any kind are not permitted on Forebay Reservoir.

Unsafe Boating Activities - Any malicious or unsafe boating activities, failure to observe posted safety rules, or California boating laws may result in a loss of boating privileges and forfeiture of all paid fees and deposits.

Noise Limits on Boats - Boat motors shall meet the noise requirements stipulated in the *ABC's of California Boating Law*. General noise from boats, including amplified sound, shall not diminish the recreational experience of others.

AR 10011.6 Mooring Facilities

The district operates a seasonal mooring facility at Jenkinson Lake. Occupants must sign a rental contract and provide proof of current insurance. Subleasing of slips is prohibited.

AR 10011.7 Pets

Pets must be on a leash and under an owner's control at all times. Pet owners are required to immediately clean up after their pets. Unleashed, vicious or noisy pets subject the owners to revocation of recreational privileges.

Specific Jenkinson Lake Restrictions – By order of the State of California, pets are not permitted in the waters of Jenkinson Lake. Violations will result in revocation of the owners' recreational privileges.

AR 10011.8 Day Use

Day-Use Vehicle Fees – All vehicles entering the recreation areas are subject to day use fees. Proof of payment must be displayed in vehicle windshield during entire visit.

Equipment Rentals - The District may rent game equipment including but not limited to horseshoes and volleyballs/nets.

Use of Sound Amplifying Equipment - Sound amplifying equipment is not allowed in day-use areas.

AR 10011.9 Campgrounds

Campsites- Campsites with a barbecue, fire ring, and table are available to the public. Available campsites include Americans With Disabilities Act accessible campsites.. Campsites not reserved in advance are available on a first-come, first-served basis. Camping registration tags must be displayed in the window of the vehicle. Campsite fee includes campsite and one vehicle only. Extra vehicles, boats, and pets are subject to additional fees.

Campsite Appearance and Cleanliness - Campsite cleanliness is required for aesthetic, sanitary, and safety purposes. Campsites must be free of debris.

Campsite Occupancy - a maximum occupancy is 8 people per campsite unless otherwise specified.

Minors at Campsites Overnight - Minors under 18 years of age shall not be allowed to reserve or register for a campsite. Minors under 18 years of age must be accompanied by their legal guardian while camping overnight.

Maximum Stay at a Campsite - The maximum stay at a campsite shall not exceed 14 consecutive nights..

Campsite "Quiet Time" - A period of "quiet time" is observed in campsites from the hours of 10:00 p.m. to 6:00 a.m. During quiet time, noise, including that from generators, radios, music and sound amplifying equipment, and other disturbing activities are not allowed.

Jenkinson Entry and Exit Gates - -Entry gates will be locked at various times depending on the season. All outside emergency personnel will have access to gate locks. Campers may exit, but reentry will be limited.

Campsite Day Guests - All guests of campers must vacate the campgrounds no later than posted day use hours. Guests may park at campsites, where space is available, but must not block any roadway or create overcrowding conditions that, in the opinion of park staff, cause a disturbance or other problems. Registered campers are responsible for the actions and behavior of their guests while in the park.

Fires at Campsites - Fires are permitted only in the provided fire rings and cannot reach a height that is dangerous. No garbage is to be burned in the fire rings and the wood must be no longer than the diameter of the fire ring.

AR 10011.10 Camp Host Program

Camp Host Positions - The District may work with volunteers during peak-use times each year to assist staff in customer service functions and maintenance of facilities.

AR 10011.11 Filming

Permits - Filming and photography are permitted subject to an application procedure, proof of insurance, and payment of applicable fees.

-- THIS PAGE INTENTIONALLY LEFT BLANK --

AR 10016 Protection of District Property and Wildlife

Approved: December 12, 2006

District Property - Visitors shall not damage or deface any recreation property owned or leased by the District.

Vegetation - Visitors to District recreation facilities shall not dig up, remove, or damage any tree, plant, shrub, or other vegetation.

Trash Disposal - Visitors shall not place or leave any glass, ashes, wastepaper, bottles, cans, or other trash or rubbish at District recreation facilities except in receptacles provided for that purpose. Trash or rubbish shall not be brought onto District recreation facilities for disposal.

Fire Hazards - Visitors shall not create any fire hazards at District recreation facilities; for example, logs that are larger than the diameter of provided fire rings shall not be burned.

Birds and Mammals - Visitors shall not abuse, injure, or kill any birds or mammals at District recreation facilities or interfere with their habitat. The California Department of Fish and Game may be notified to address these kinds of problems.

AR 10017 Recreation and Forest Lands Adjoining Caples and Silver Lakes

Approved: December 12, 2006

AR 10017.1 Camping

Camping (defined as the temporary use of District lands for the purpose of overnight occupancy without a permanently fixed structure) is prohibited.

AR 10017.2 Vehicle use

- Possessing and/or using a vehicle off of developed forest roads is prohibited.
- Vehicles use on trails is prohibited.

AR 10017.3 Exceptions

- Any federal, state, or local officer or member of an organized rescue or fire fighting force in the performance of an official duty is not restricted by Administrative Regulation 10017.2, nor are persons with a permit specifically authorizing such vehicle use.

AR 10018 District Recreation Staff

Approved: December 12, 2006

District park rangers will adhere to the guidelines outlined in EID's *Park Manual*.

AR 10019 Water Quality

Approved: December 12, 2006

Directive – All District staff will treat water quality in EID owned lakes seriously and will immediately report any activity—including but not limited to gasoline or oil spills in the lake and trash at campsites and along shorelines—that could impact the quality of the water

Dogs - Dogs and other domestic animals are not permitted in Jenkinson Lake.

Diapers - Babies in diapers are not permitted in Jenkinson Lake

El Dorado Irrigation District

BP 11000 FEES AND CHARGES

BP 11010 Fees and Charges

Adopted: November 27, 2006
Supersedes: Resolution No. 04-120
Portions of Regulation Nos. - 4, 5, 6, 7, 8, 10, 13, 14, 18, 19, 22, 23

The District shall strive to recoup all costs of providing services through rates, fees, charges, fines, and deposits. The Board will adopt changes in rates pursuant to Article XIII D Section 6 of the California Constitution (Proposition 218) and changes to Facility Capacity Charges (FCCs).

In relation to FCCs, the District is committed to provide capacity for a reasonable rate of growth within its service area. FCCs will be charged to applicants for new service to cover the costs of services that include but are not limited to water filtration, sewage treatment, recycled water, system storage, and transmission and distributions systems. Existing customers will not share in these costs.

The General Manager is authorized to approve changes in fees, charges, fines, and deposits as warranted by the costs of providing services.

El Dorado Irrigation District

AR 11010 Adoption of Rates, Fees, and Charges

Approved: October 26, 2011
Revised: October 4, 2013

The District will establish all user charges and fees at the full cost of providing the service, including direct, indirect, overhead, and capital recovery costs.

The Board of Directors will review and adopt rates and Facility Capacity Charges (FCCs). The General Manager or her/his designee will periodically review and report to the Board on rates and FCCs and will review and approve all other District fees, charges, penalties, and deposits.

A copy of *Attachment A*, which sets forth the *Fees/Deposits/Penalties* is available upon request from the Customer Services Division.

AR 11020 Deposits - General

Approved: December 12, 2006

In general, District-required deposits are estimates only. Project-related deposits include averages of overhead, materials, and labor. Deposits for equipment loans are based on the average time and materials spent to inspect, repair, recalibrate, and clean the loaned equipment.

If a deposit falls short of actual costs, the District will bill the customer for the difference. If the deposit exceeds actual costs, the District will refund the difference to the customer.

AR 11030 Bond Segregation / Re-apportionment Deposit

Approved: December 12, 2006

The District requires a deposit from the property owner to cover costs associated with reapportionment of a bond assessment. District engineering, legal, and administration costs will be charged against the deposit.

AR 11040 Land Annexation Fee

Approved: December 12, 2006

This fee reimburses the District for one year's taxes based on a 10-year average tax rate per $100 assessed land value paid for tax Class 207 voter approved debt. The fee will be updated annually and applied to the current assessed land value of the property.

AR 11050 Land-based Financing Fee

Approved: December 12, 2006

The District will consider developer requests or petitions to initiate the formation of a special assessment or community facilities district, which would be considered only after receiving the required form(s) and a non-refundable deposit. The deposit will be 1% of the proposed principal amount of the bonds to be issued. It will be used to cover District labor and other costs such as independent financial advisory, appraisal, and market absorption analysis services that are associated with proceedings and are not contingent on bond issuance.

The deposit is reimbursable from the proceeds of bonds upon issuance. In the event that actual costs exceed deposited fees, the applicant will deposit additional funds to advance the process. If the District does not receive additional funds within the requested time period, the proceedings will be suspended.

AR 11060 Customer Maintenance Call Fee

Approved: December 12, 2006

If a District employee or work crew is dispatched in response to a customer call to fix an operational problem or leak, and the problem is determined to be related to customer-owned equipment, the District will charge a fee for the maintenance call based on time and materials, including overhead. To avoid unnecessary charges, District personnel will ask customers to identify the problem and alert them to their responsibility for customer-owned equipment.

AR 11070 Facility Improvement Letter Fee

Approved: December 12, 2006

The District will charge a fee for completing a Facility Improvement Letter. This fee will reimburse District costs to review requests for future service and analyze the capacity of the District's systems and available supply.

AR 11080 Delinquent Account Field Call Fee

Approved: December 12, 2006

The District will charge for a field call to deliver a delinquent account notification or turn off service on a delinquent account. The fee will cover the cost of dispatching personnel to complete the action. EID will make a reasonable effort to contact customers prior to discontinuance of service for non-payment.

AR 11090 Temporary Water Use Charges

Approved: December 12, 2006
Revised: December 18, 2012

- **Charges for use of temporary water use hardware –** Customers requesting temporary water use will be charged to cover the District's costs of providing service. These charges are defined on page three of the Temporary Water Use permit.

- **Deposit for temporary water use hardware –** The District will require a deposit to cover labor and materials for any repairs required on District hardware.

- **Fine for tampering with temporary water use hardware –** Anyone who uses temporary water use hardware to take unauthorized water or alters the District hardware, including breaking the safety wire on the adjusting vane and changing the configuration of the meter assembly, will be fined.

El Dorado Irrigation District

AR 11100 Private Fire Service Charges

Approved: December 12, 2006

A bi-monthly fee for private fire service will be charged based on the size of the service. In addition, water consumption resulting from leakage and testing will be charged at double the rate for general use. Water used for any purpose other than testing is a violation and will be charged at five times the rate for general use. There will be no charge for water used to extinguish accidental fires.

AR 11110 Commercial and Industrial Waste Discharge Permit Fee

Approved: December 12, 2006

The District will charge a fee for a Commercial and Industrial Wastewater Discharge Permit to recover the cost of implementing the Industrial Pretreatment Program.

AR 11120 Inspection Fees

Approved: December 12, 2006

Recycled water on-site facility inspection fee – This fee **c**overs the cost of labor and materials for project set-up and inspections.

Residential wastewater inspection fee – This fee **c**overs labor and materials for the inspection of each unit of service. This fee is payable at the time of application.

AR 11130 Meter Fees

Approved: December 12, 2006

Meter installation deposit/fee – The District will charge a flat fee for installation of ¾-inch and 1-inch meters if an existing outlet is provided. Payment for all other meter installations will be based on a written job estimate. A deposit must be paid prior to commencement of work on these installations. The deposit will be used for labor, materials, equipment, and overhead and may also include the District's costs in obtaining a Department of Transportation permit, a complete road crossing, and/or a bore for the meter installation.

Meter tampering fee – When meter tampering is suspected, the District will take steps to assure that the tampering ceases and that the equipment is restored to proper working condition. Tampering is interference with a pin-lock or pad-lock or reconnection of a pulled meter. If meter registers are broken, if meters are removed, or if curb-stops are altered, the District will make the necessary repairs to restore service. The property owner may be billed for time and materials.

Meter testing and repair fee – Typically, the District receives requests to test meters when high consumption is registered. If the meter is determined to be defective, the meter is repaired or replaced at no charge to the customer. If the meter meets acceptable flow standards, the customer may be billed for the cost associated with the meter test.

AR 11140 Ditch Service Fees

Approved: December 12, 2006

Ditch service call fee - The District will charge a fee to ditch customers who request an increase or decrease in their flow during the irrigation season. This fee will cover the cost of labor to make the necessary weir adjustments.

Tampering with ditch flow fee - Customers or other individuals who receive unauthorized water from ditches will be charged a tampering fee.

El Dorado Irrigation District

AR 11150 Account Set-Up Fee

Approved: December 12, 2006

The District will charge an account set-up fee when a new customer is set up on an established meter. This fee will cover administrative costs and the labor to perform a field meter read (trip charge).

AR 11160 Bad Check Fee

Approved: December 12, 2006

The District will charge a fee to cover costs associated with processing returned checks and will assess a graduated penalty per occurrence within a 12-month period.

AR 11170 Late Payment Fee

Approved: December 12, 2006

The District will assess a late payment charge on past due accounts. This fee will be applied to a past due account for any unpaid balance greater than $10.00.

AR 11180 Lien Release Fee

Approved: December 12, 2006
Revised: August 20, 2013

The District will charge customers a fee to release a lien on a parcel. The fee will be equal to the administrative cost to process and deliver the lien release. It will include a fee set by the El Dorado County Recorder's Office, which will be paid to the El Dorado County Recorder's Office.

El Dorado Irrigation District

AR 11190 Overhead Charges

Approved: December 12, 2006

- **Overhead for development project labor –** Project-related work performed by the District's development engineering and construction inspection staff will be fully cost allocated. An overhead amount will be charged in addition to full direct labor costs and benefits. This charge will be recalculated annually by the District.

- **Overhead for District materials –** The most current District overhead rate will be applied to all materials charges. This charge is to be recalculated annually by the District.

AR 11200 Quitclaim Easement Charges

Approved: December 12, 2006

EID costs associated with quitclaim easements will be fully recovered by the District through time and materials charges, plus overhead.

AR 11210 Miscellaneous Fees

Approved: December 12, 2006

These fees include but are not limited to general administrative costs; labor to retrieve and duplicate District records; reproduction of reports, manuals, maps, and other documents; and reproduction of tapes, CDs, and other electronic or digital media. Miscellaneous Fees will be recalculated on an annual basis.

AR 11220 Special Rate Categories

Approved: December 12, 2006
Withdrawn: August 20, 2013

AR 11230 Penalties and Fines

Approved: December 12, 2006

Penalties and fines paid to the District will be designated for business purposes.

Determination of penalties and fines – When determining the level of penalties and fines, the District will consider all relevant facts and circumstances and may consult with regulatory agencies such as the Department of Health Services and Central Valley Regional Water Quality Control Board, as appropriate. The District reserves the right to impose fines and penalties in excess of those above, including possible termination of service, upon a finding of gross negligence or willful misconduct.

Non-payment of penalties and fines – When penalties and fines are not paid within 30 days or corrective action is not taken within the prescribed time-frames, the District may temporarily terminate service. Service will be restored when penalties and fines are paid and/or corrections are made.

El Dorado Irrigation District

AR 11240 Attachment A

Approved: December 12, 2006

Schedule of 2007
FEES / CHARGES / PENALTIES / DEPOSITS

This document will consist of one or more charts containing the fees, deposits and other charges that are proposed for 2007. It will be developed each year as part of the budget process and then included as an attachment to BP11000.

Until adoption of the 2007 budget, Section 4.0 Miscellaneous Fees / Deposits / Penalties of EID's current rules and regulations binder and Resolution No. 04-120 will remain in effect.

El Dorado Irrigation District

BP 12000 BY-LAWS OF THE BOARD

BP 12010 Purpose

Adopted: July 19, 2004
Updated: December 11, 2006
Supersedes:

The purpose of these By-laws is to provide Board directed rules for the conduct of the Board members and meetings of the Board of Directors of the District.

BP 12020 Duties and Powers

Adopted: July 19, 2004
Updated: December 11, 2006
Supersedes:

The Board's role is to provide oversight and direct the implementation of the District's mission. The Board will do so by deciding and monitoring policy and fiscal matters. Board members will use the following methods to address their concerns – advise the General Manager, work through Board committees, present specific recommendations to the whole Board for action. Board members shall be guided by a desire to achieve and support the District's mission in a constructive manner.

BP 12030 Public Statements and Individual Board Member Actions

Adopted: December 11, 2006
Supersedes:

All public statements in the name of the Board shall be issued by the Board President or, if appropriate, by another Board member, the General Manager, or the General Counsel, but only at the direction of the Board President unless otherwise authorized by the Board without the Board President's direction. No individual Board member shall make public statements or express an opinion or position, orally or in writing, in such a way that it allows an audience to conclude that such opinion or position is held by the Board, unless the Board has acted as a unit to adopt the position or opinion.

The Board is the unit of authority. Apart from the normal function as part of the unit, a Board member has no individual authority. Individually, a Board member may not commit the District or the Board to any policy, act, or expenditure. No individual member of the Board has any administrative responsibility or authority with respect to the District or any of its programs, nor as an individual to command the services of any employee of the District.

Non-compliance with this policy shall be grounds for censure by the Board.

BP 12040 Code of Ethics

Adopted: December 11, 2006
Supersedes:

In all actions as a Board member, the first commitment is to the betterment of the District and the community. In the performance of these duties, Board members shall be aware of, and comply with the Constitutions of the State and Nation, the California Water Code, other laws pertaining to the services provided by the District, and the established policies of the District. As elected representatives Board members can neither relinquish nor delegate their responsibilities to any other individual or group.

In addition to giving consideration to the wants and needs of their individual constituency, each Board member shall consider the District as a whole.

Board members shall present concerns and concepts through the process of Board debate and, if in the minority, the Board member shall respect the divergent opinions presented.

Board members shall devote sufficient time, thought, and study to proposed actions to make informed decisions.

BP 12050 Accountability, Review, and Evaluation

Adopted: December 11, 2006
Supersedes:

In exercising their oversight, and in order to maintain accountability for the performance of their duties and responsibilities, the Board shall provide for ongoing review and evaluation of current programs, services, and activities of the District. The Board recognizes that this includes regular reports to the public on qualitative and quantitative assessments.

The General Manager shall establish and conduct regular assessments of the services and activities of the District. This may include oral or written reports presented at meetings of the Board.

BP 12060 Compensation

Adopted: December 11, 2006
Supersedes:

The Board's compensation is defined by Section 21166 of the California Water Code and it is fixed by the adoption of an ordinance in accordance with Section 21166.

BP 12065 Board Expense and Reimbursement

Adopted: August 15, 2007
Supersedes: Policy Statement No. 11

The reimbursement of Board expenses shall comply with Sections 53232.2 and 53232.3 of the California Government Code or their successors. Eligibility and procedures shall be defined by the terms of a resolution adopted in accordance with those statutes.

AR 12065 Board Expense and Reimbursement

Approved: August 15, 2007
Revised: July 14, 2014

Purpose

This document sets forth the policy of the El Dorado Irrigation District concerning Directors' expense payments and reimbursements.

Intent

The District encourages Directors to take advantage of opportunities to be informed concerning matters of interest to the District, and to inform others of the activities and interests of the District. The District encourages Directors to attend conferences, seminars and other meetings that require their participation or provide the foregoing opportunities. Directors are entitled to reimbursement for the amount of reasonable and prudent expenditures incurred by Directors in the performance of their duties as Directors. Directors may not profit by or experience a financial loss in the course of conducting District business. The District does not pay or reimburse for any expenses incurred by spouses and other family members of Directors. No expense is payable or reimbursable unless it is consistent with the Intent of this policy.

Procedures

A. The District's annual budget will set an appropriate level of funding for payment and reimbursement of Directors' expenses. The General Manager or his or her designee will be responsible for ensuring that the budgeted amount is not exceeded without approval of the Board.

B. Direct expenses for registration fees, travel, hotels and meals will be paid by the District in accordance with the guidelines and per diem rates for an accountable expense reimbursement plan as defined in the United States Internal Revenue Service's Publication 535, section 13 and Publication 1542 ("Accountable Plan"). A copy of the Accountable Plan documents can be obtained from the District Director of Finance and Management Services.

C. The following expenses are permissible business-related expenditures:

1. Personal Vehicle Expenses. A director will be reimbursed for travel miles at the rate authorized under the Accountable Plan for all necessary travel. A Director will be considered to have accounted for personal vehicle expenses by indicating the miles traveled, the business purpose of the travel and the dates of travel.

2. Hotel Expenses. The District will pay or reimburse a Director's hotel expenses necessarily incurred. A Director may either (a) receive reimbursement for the per diem hotel rate provided in IRS Publication 1542 for the locality in which the hotel is located; or (b) use the Director's personal funds to pay for hotel charges, in which case the District will reimburse the Director for actual charges up to three times the applicable per diem hotel rate provided in the Accountable Plan; or (c) request that the District pay for hotel charges, in which case the District will pay for actual charges up to three times the per diem hotel rate provided in the Accountable Plan, and the Director will be responsible for any excess hotel charges.

3. Meal/Incidental Allowance. A Director attending a conference, seminar, or meeting outside of El Dorado County will be given a meal/incidental allowance for costs necessarily incurred. A Director may either (a) receive reimbursement at the per diem meal/incidental rate provided for in Publication 1542 for the locality in which the conference, seminar, or meeting is held; or (b) use the Director's personal funds to pay for meals and incidentals, in which case the district will reimburse the Director for actual charges up to three times the per diem meal/incidental rate provided for in the Accountable Plan. If a Director is not traveling for a full day, defined as from 12:01 a.m. to 12:00 midnight, the per diem meal/incidental allowance will be prorated according to the actual hours of travel. If a Director who is not traveling for a full day uses his or her personal funds to pay for meals and incidentals, the District will reimburse the Director for actual charges incurred for meals and incidentals while traveling, up to three times the prorated per diem meal/incidental rate provided for in the Accountable Plan. Tips for meals should not be reported separately because they are included in the allocated amount of the meal per diem. Actual expenses for alcoholic beverages shall not be reimbursed. Incidentals include but are not limited to tips for taxi drivers, baggage porters, bellhops and hotel maids.

4. Common Carrier Travel. When personal vehicle use for District business is impractical due to time and/or distance, a Director may use regularly-scheduled commercial carriers for travel. A Director traveling by plane, train, rental car, bus, or taxi will travel by the least-expensive fare actually available for the date and time of the travel. Notwithstanding the foregoing, a Director may utilize charter transportation if such transportation is included as part of an integrated package price for travel, including but not limited to Water Education tours and the Sacramento Chamber of Commerce "Cap to Cap" program. Airport or train parking are reimbursable expenses; however, long-term parking shall be used at airports and train stations for travel exceeding 24 hours and reimbursement shall be limited to the long-term parking rate in such instances. A Director may use personal funds to purchase a common-

carrier fare, in which case the District will reimburse the Director for the actual amount of the fare.

5. Telephone/Computer/Fax/Cellular/Internet Services. A Director will be reimbursed for actual telephone (including one cellular phone), computer (including one personal computer and software applications required to effectively and securely perform District business), fax and internet service provider expenses incurred on District business. Each Director will be offered a District-issued and paid cellular phone, but is not obliged to accept it.

6. Meeting/Conference/Seminar Registration and Similar Expenses. The District will pay or reimburse a Director's actual registration charges or similar expenses incurred to gain admission to a meeting, conference, seminar or similar activity. Such payment or reimbursement, as well as hotel and meal/incidental per diem payments or reimbursements, shall be limited to a maximum of three days per event with the following exception: ancillary programs that are not part of the main conference, such as workshops held immediately before or after the main conference.

7. Meals Within El Dorado County. The District will pay or reimburse a Director for meals within El Dorado County. If a Director seeks reimbursement for a meal under this provision, the Director may either (a) receive reimbursement at one-third of the per diem meal/incidental rate provided in Publication 1542 for El Dorado County; or (b) use the Director's personal funds to pay for the meal, in which case the District will reimburse the Director for actual charges up to the per diem meal/incidental rate provided for in the Accountable Plan. Tips for meals should not be reported separately because they are included in the allocated amount of the meal per diem. Actual expenses for alcoholic beverages shall not be reimbursed.

8. Meals of Other Persons. This Policy recognizes that at times it is appropriate for a Director to be reimbursed for the meal expenses of others who are meeting with a Director during the meal. If a Director seeks reimbursement for the meals of other persons under this provision, the Director may either (a) receive reimbursement for each other person at one-third of the per diem meal/incidental rate provided for in Publication 1542 for the locality in which the meeting is held; or (b) use the Director's personal funds to pay for meals and incidentals, in which case the District will reimburse the Director for actual charges for each other person up to the per diem meal/incidental rate provided for in the Accountable Plan. Tips for meals should not be reported separately because they are included in the allocated amount of the meal per diem. Actual expenses for alcoholic beverages shall not be reimbursed.

9. Membership Fees or Dues. The District will pay or reimburse a Director's actual fees or dues for membership in organizations if the Board President or Board of Directors finds that the membership will serve a District business purpose.

D. In order to be reimbursed for any expense authorized under this Policy, a Director must fill out a District-provided expense report. The report form is designed to ensure that Directors' expense reimbursements comply with the requirements of the Accountable Plan. Accordingly, the General Manager will review each report form, and sign indicating compliance with the requirements of this Policy. In all cases where a Director seeks reimbursement for expenses incurred while attending a conference, seminar or other meeting, the Director must attach a copy of the conference registration form to his or her expense reimbursement report as a condition of receiving reimbursement for an appropriately-incurred business expense. Originals or copies of additional documentation shall be required as follows as a condition of receiving reimbursement under this Policy:

1. Personal Vehicle Expenses. The Director will not be required to attach any additional documentation to the expense report.

2. Hotel Expenses. If a Director is entitled to be reimbursed for hotel charges, the Director may claim the per diem hotel rate allowed in Publication 1542 for the locality in which the hotel is located. The Director will report on the District expense report as directed without attaching any additional documentation except as specified in this Policy. If a Director wishes to use personal funds to pay hotel charges and be reimbursed for the actual charges to the extent allowed by this Policy, the Director must attach to the expense report an itemized bill issued by the hotel and the credit card receipt or other proof of the Director's payment.

3. Meal/Incidental Allowance. If a Director is entitled to be reimbursed for a meal/incidental allowance, the Director may claim the per diem amount allowed in the Publication 1542 for the locality in which the expense was incurred. The Director will report on the District expense report as directed without attaching any additional documentation. If a Director wishes to use personal funds to pay for meals and claim reimbursement for the actual meal charges to the extent allowed by this Policy, the Director must attach to the expense report an itemized bill or receipt issued by the restaurant and the credit card receipt or other proof of the Director's payment. If a Director wishes to use personal funds to pay for incidental expenses and claim reimbursement for actual incidental expenses to the extent allowed by this Policy, the Director must attach to the expense report a bill or receipt issued by the source of each incidental expense, subject to paragraph 11, below.

4. Common Carrier Travel. A Director must attach to his or her expense report the fare, coupon, or itemized bill from a travel agency, airline or

railroad showing the actual amount expended for such travel. A Director must attach to his or her expense report receipts for any airport or train parking authorized by this Policy, showing the actual amount expended for such parking.

5. Telephone/Computer/Fax/Cellular/Internet Service. A Director must attach to his or her expense report an itemized bill or receipt from each service provider.

6. Meeting/Conference/Seminar Registration and Similar Expenses. A Director must attach to his or her expense report a completed conference registration form and the credit card receipt or other proof of the Director's payment.

7. Meals Within El Dorado County. If a Director is entitled to be reimbursed for a meal within El Dorado County, the Director may claim one-third of the per diem amount allowed in Publication 1542 for El Dorado County. The Director will report on the District expense report as directed without attaching any additional documentation. If a Director wishes to use personal funds to pay for meals and claim reimbursement for the actual meal charges to the extent allowed by this Policy, the director must attach to the expense report an itemized bill or receipt issued by the restaurant and the credit card receipt or other proof of the Director's payment.

8. Meals of Other Persons. If a Director is entitled to be reimbursed for a meal of one or more other persons, the Director may claim, per person, one-third of the per diem amount allowed in Publication 1542 for the locality in which the expense is incurred. The Director will report on the District expense report as directed without attaching any additional documentation, except that the Director shall identify the other person(s) and the business purpose of the meeting. If a Director wishes to use personal funds to pay for meals and claim reimbursement for the actual meal charges to the extent allowed by this Policy, the Director must attach to the expense report an itemized bill or receipt issued by the restaurant and the credit card receipt or other proof of the Director's payment. In addition, the Director shall identify the other person(s) and the business purpose of the meeting.

9. Membership Fees or Dues. A Director must attach to his or her expense report a bill or receipt from the organization and the credit card receipt or other proof of the Director's payment.

10. In all cases where the District pre-pays a Director's expense for hotel expense, conference registration, common carrier travel, or membership fees or dues as authorized by this Policy, the Director will remain responsible for filing an expense report and attaching any appropriate

documentation obtained by the Director in conformance with paragraphs 1 through 9 above.

11. For incidental expenses where no receipt is available, e.g. tips, toll charges, parking meter costs, etc., a reimbursement request for such expenses may be claimed on the District approved expense report. Certification that such expenses were actually incurred by the Director will be made when signing the District approved expense report form.

E. In accordance with the Accountable Plan, a Director must substantiate all expenses on an expense report with the appropriate documentation attached within 60 days of incurring or paying the expense. Any mis- or late-reported expenses incurred by a Director will not meet the requirements of the Accountable Plan, and will be considered income to the affected Director. To comply with the applicable tax laws, the District will be required to issue to a Director a Form W-2 reporting all mis-or late-reported expenses as income. Expenses turned in late, after 60 days, will be subject to Board approval.

F. District will prepare a list of the amount and purpose of each expense reimbursement paid by the District to each Director. This information will be included in the agenda materials for each regular monthly Board of Director’s meeting each month.

El Dorado Irrigation District

BP 12070 Members

Adopted: July 19, 2004
Updated: December 11, 2006
Supersedes:

The Board shall consist of five members, each for a four-year term. The five members are elected by the voters in their Division according to California state law.

Vacancies shall be filled according to California state law.

BP 12080 Meeting Procedures

Adopted: July 19, 2004
Updated: December 11, 2006
Revised: July 14, 2014

A. Except in unusual circumstances, the Board shall, in accordance with *Robert's Rules of Order Newly Revised,* limit itself to the following motions in ascending order of precedence:

1A. Main motions (same order of precedence as 1B.)
a. Original main motions
b. Incidental main motions

1B. Motions that bring a question again before the assembly (other than motion to reconsider) (not in order of precedence)
a. Take from the table
b. Rescind
c. Discharge

2. Subsidiary motions (in ascending order of precedence)
a. Postpone indefinitely
b. Amend
c. Refer to committee
d. Postpone to a certain time
e. Limit or extend limits of debate
f. Previous question
g. Lay on the table

3. Privileged motions (in ascending order of precedence)
a. Call for the orders of the day
b. Raise a question of privilege
c. Recess
d. Adjourn
e. Fix the time to which adjourn

4. Incidental motions (not in order of precedence)
a. Point of order
b. Appeal
c. Suspend the rules

d. Objection to the consideration of the question
e. Division of a question
f. Consideration by paragraph or Seriatim
g. Request to be excused from a duty
h. Requests and inquiry
    i. Parliamentary inquiry
    ii. Point of information
    iii. Request for permission to withdraw or modify a motion
    iv. Request to read papers

5. Motion to reconsider (subject to Section H. below)

B. Except as prohibited by the Brown Act, the Board, by motion passing with minimum of four affirmative votes, may suspend or vary the application of these meeting procedures with regard to any proceedings, or to any particular problem before the Board.

C. Meetings shall be conducted within the guidelines of any regularly adopted agenda.

D. Three voting members of the Board shall constitute a quorum for the transaction of business. The only action which may be taken at a meeting attended by less than a quorum is to adjourn the meeting.

E. At each regular meeting of the Board, the minutes of the prior meeting shall be presented for approval.

F. Members of the Board who are unable to attend a meeting shall, if possible, so inform the Clerk to the Board before said meeting, in order to determine a quorum in advance.

G. Except as otherwise provided by law or District procedures, to constitute "action taken" on any item, the motion must receive at least three affirmative or negative votes.

H. A motion for previous question may be passed by three affirmative votes.

I. No matter upon which "action is taken" may be reagendized or reconsidered for a period of six (6) months except by the following process: The Board of Directors may, upon any member's agendizing the matter, vote to reconsider any action previously taken, and if a majority of the Board votes to reconsider, the matter shall be placed on the agenda for reconsideration at a subsequent meeting.

J. The rules contained in the current edition of *Robert's Rules of Order Newly Revised* shall govern the District in all cases to which they are applicable and in which they are not inconsistent with applicable law, these By-Laws, or any District policy statement.

BP 12080.1 Voting

Voting on resolutions and motions shall be recorded by Division and declared passed or failed by the Clerk to the Board.

AR 12081 Meetings

Approved: December 12, 2006
Revised: July 19, 2012

A. Regular meetings shall generally be held on the second and fourth Monday of each month at 2890 Mosquito Road, Placerville, California starting at 9:00 a.m. in open session. When the date falls on a legal holiday, the meeting shall be specified in advance by the Board.

B. Meetings may be adjourned to another time and place by the President. He/She shall give public notice of the time and place during the meeting so adjourned. The meeting place shall be within the District boundary except as provided in Government Code Section 54954.

C. Special meetings of the Board may be called at any time by the President of the Board or a majority of the Directors by giving at least 24-hour written notice to each Director as well as each local newspaper of general circulation and radio or television station requesting notice in writing. The call and notice shall specify the time and place of the special meeting and the business to be transacted or discussed. No other business shall be considered at the meeting. The call and notice shall be posted at least 24 hours prior to the special meeting in a location that is freely accessible to members of the public.

D. Emergency meetings of the Board may be held when required and shall be ordered by the President, or by a majority of the Directors. The emergency meeting shall meet the definitions and follow the procedures provided in Government Code Section 54956.5. Each local newspaper of general circulation and radio or television station which has requested notice of special meetings pursuant to Government Code Section 54956 shall be notified by the Clerk to the Board, or other person designated by the President, one hour prior to the emergency meeting or, in the case of a dire emergency, at or near the time that the President or designee notifies the Directors of the meeting. Notification shall be by telephone or email addresses provided in the most recent request of such newspaper or station notification of special meetings shall be exhausted. To the extent that telephone or email services are not functioning, notification shall be deemed waived and the District shall notify such newspaper or station of the fact of the holding of the emergency meeting, the purpose of the meeting, and any action taken at the meeting as soon after the meeting as possible. The minutes of an emergency meeting, a list of persons who the President of the Board, or designee of the Board, notified or attempted to notify, and a report of all roll-call votes, and any actions taken at the meeting shall be posted for at least 10 days in a public place as soon as after the meeting as possible.

E. Closed sessions may be agenized for a regular, special, or emergency meeting, or called by the Board or its President during the course of a regular or emergency meeting, under any applicable provision of the Brown Act. All procedures relating to closed sessions shall comply fully with the Brown Act.

F. Workshops and standing committee meetings will normally be held at 2890 Mosquito Road.

AR 12082 Order of Business

Approved: December 12, 2006
Revised: November 4, 2010
Revised: May 15, 2014

The normal order of business for Board meetings shall be as follows. When the General Manager's Report includes employee recognition, that portion of the Report shall occur immediately prior to the approval of the Consent Calendar. The President of the Board has the prerogative to alter the order of items 6 through 16 to enhance public participation or meeting efficiency, except that time-specific items shall not be called prior to their noticed time.

1. Roll Call
2. Pledge of Allegiance
3. Moment of Silence
4. Adopt Agenda
5. Approve Consent Calendar
6. Action on Items Pulled from Consent Calendar
7. Public Comment
8. Board of Directors' Communications
9. Clerk to Board Communications
10. General Manager's Report
11. Public Hearings
12. Workshops
13. Information Items
14. Director Items
15. Action Items
16. Closed Session
17. Review of Assignments
18. Adjournment

AR 12083 Order for Each Specific Agenda Item

Approved: December 12, 2006

A. President announces matter next by name and item number to be discussed.

B. President or General Manager calls staff to review items and present recommendations.

C. President or General Manager calls on principal party, applicant or person requesting Board actions.

D. President asks for input from public. Public input will normally be limited to five (5) minutes per person. The President may establish other guidelines as he/she sees fit based upon the number of those wishing to speak, the time available, or other factors.

E. President calls for discussion from Board members and controls further public comment. The President will normally limit discussion to the Board until action is taken, unless directed otherwise by a majority of the Board.

F. Board acts to:

1. close or continue hearing until later date,

2. request further information from staff or others, which information shall be limited to specific response to Board questions,

3. approve, conditionally approve, deny or take under advisement, and

4. continue to a later date any timed appearances or public hearing items that take more time than allocated.

AR 12084 Agenda Items

Approved: December 12, 2006

Agenda items and requests for appearances shall be in writing and shall specifically set forth both the matter to be discussed and the action requested of the Board, along with copies of said request and documentary information or supporting material.

BP 12090 Board Officers

Adopted: July 19, 2004
Updated: December 11, 2006
Supersedes:

A. The officers of the Board shall consist of a President and Vice President.

B. The President and Vice President shall be elected to one-year terms by members of the Board at the first regular meeting in December of each year during Board non-election years, or either a designated meeting in December or first meeting the following month in election years. The President and Vice President shall take office immediately following the election. Vacancies shall be filled in the same manner, at a regular meeting following the time the vacancy occurs. No officer shall serve more than two consecutive years in the same position, unless elected by a four-fifths vote of the Board.

C. The President shall act as the presiding officer at all meetings of the Board.

D. The Vice President shall preside and exercise all duties of the President in his/her absence, or by direction of the President. In the absence of both the President and Vice President, and temporary President shall be elected by the Board to act as President until the return of the President or Vice President.

BP 12100 Representative Appointments

Adopted: December 11, 2006
Supersedes:

The President, with concurrence by the Board, may appoint Board representatives to various organizations and associations. These entities shall be identified in AR 12101 and updated annually in consultation with the General Manager and General Counsel.

El Dorado Irrigation District

AR 12101 Board Representative Appointments

Approved: December 12, 2006
Revised: November 24, 2014

Board members may be appointed to represent the District in the following organizations:

1. American Public Power Association
2. Association of California Water Agencies
3. California Association for Sanitation Agencies
4. California Municipal Utilities Association
5. Citizens for Water
6. El Dorado County Water Purveyors Association
7. El Dorado Forum
8. El Dorado County Local Agency Formation Commission
9. Mountain Counties Water Resources Association
10. Regional Water Authority
11. SAGE
12. Taxpayers' Association of El Dorado County

BP 12110 Standing Committees

Adopted: December 11, 2006
Supersedes:

The President, with concurrence by the Board may appoint Board members to serve as Chairs of Board Standing Committees. The Standing Committees shall be identified in AR 12111 and updated annually in consultation with the General Manager and General Counsel.

El Dorado Irrigation District

AR 12111 Standing Committee Appointments

Approved: December 12, 2006
Revised: November 24, 2014

A. The following standing committees, composed of the entire membership of the Board, are hereby established:
   1. Engineering and Operations;
   2. Insurance and Personnel;
   3. Finance, Rates, and Charges;
   4. Legal and Legislation; and
   5. Recreation and Property Management.

B. Committees may meet on the following duties, and as necessary:
   1. Engineering and Operations – Monthly at the first Board meeting of the month;
   2. Insurance and Personnel – Quarterly, at the second Board meeting of the month;
   3. Finance, Rates, and Charges – Quarterly, at the first Board meeting of the month;
   4. Legal and Legislation – Second Board meeting of October and June; and
   5. Recreation and Property Management – First Board meeting of October and June.

C. The President, with the approval of the Board, may appoint two chairs to each Board Standing Committee.

BP 12120 Ad-hoc Committees

Adopted: December 11, 2006
Supersedes:

The President, with concurrence by the Board, may appoint ad-hoc committees.

El Dorado Irrigation District

BP 12130 Conflict of Interest

Adopted: December 11, 2006
Supersedes:

Except as expressly permitted under the terms of the Political Reform Act (Government Code Section 81000 et seq.), a Board member shall not take any action on, or participate in any discussion or otherwise influence the Board on any matter of Board business in which said member of the Board has a "financial interest" as defined under the Political Reform Act.

RESOLUTION NO. 182-2011

OF THE BOARD OF SUPERVISORS OF THE COUNTY OF EL DORADO

RESOLUTION OF INTENTION TO AMEND THE GENERAL PLAN

WHEREAS, the County of El Dorado is mandated by the State of California to maintain an adequate and proper General Plan; and

WHEREAS, The County of El Dorado's General Plan and the various elements thereof must be continually reviewed and updated with current data, recommendations and policies; and

WHEREAS, on April 4, 2011, Development Services presented to the Board of Supervisors the first Five-Year Review of the General Plan with findings that support a need for a variety of revisions to policies related to the development of housing affordable to the moderate-income earner, the creation of jobs, improving sales tax revenues, further supporting the promotion and protection of Agriculture and to address recent changes in State law; and

WHEREAS, on July 25, 2011, Development Services presented to the Board of Supervisors a list of key issues and options for addressing identified General Plan amendment components discussed on April 4, 2011 as part of the General Plan 5 year review; and

WHEREAS, the Board of Supervisors directed staff to return with a comprehensive Resolution of Intention that included previously adopted Resolutions of Intentions to amend the General Plan including; 1) ROI 274-2008, adopted 10/7/2010 - Planned Development policies for 30 percent Open Space and requirement for a Planned Development when creating 50+ parcels; 2) ROI 110-2009 adopted 5/19/2009 - Community Region Boundary Change for Camino/Pollock Pines; 3) ROI 179-2010 adopted 12/7/10 - Historical Design Overlay for historical town sites of El Dorado and Diamond Springs; and

WHEREAS, the Board of Supervisors intends to have the above listed Resolutions superseded by this resolution.

NOW, THEREFORE, BE IT RESOLVED that the Planning Commission and Board of Supervisors will set public hearings to consider the following amendments:

LAND USE ELEMENT

Land Use Map

Camino/Pollock Pines Community Region Boundary amendment: consider amending the Camino/Pollock Pines Community Region Boundary to create three Rural Centers to allow for separate and distinct opportunities for each of the communities.

Policy 2.1.1.3

Commercial/Mixed Use: Consider amending allowable residential density by increasing residential use as part of a Mixed-use development from 16 units per acre to 20 units per acre to achieve CEQA streamlining benefits.

Policy 2.2.1.2 and Table 2-1

Table 2-1 & Commercial and Industrial Use: Consider amending General Plan Table 2-1 and Policy 2.2.1.2 for Commercial and Industrial to allow for commercial and industrial uses in the Rural Regions.

Commercial/Mixed Use: Consider deleting the sentence, "*The residential component of the project shall only be implemented following or concurrent with the commercial component.*"

Industrial Use: Consider deleting the requirement for Industrial Lands to be restricted to only industrial lands within, or in close proximity to Community Regions and Rural Centers. Delete the requirement that Industrial Lands in Rural Regions can only provide for on-site support of agriculture and natural resource uses.

Multi-Family Use: Consider amending density from 24 units per acre to 30 units per acre to comply with California Government Code 65583.2(c)(iv) and (e) which requires jurisdictions within Metropolitan Statistical Areas (MSA) of populations greater than 2,000,000 to allow for up to 30 units per acre when determining sites to meet the low and very low housing allocation categories. El Dorado County is located within the Sacramento MSA. Amend the Multi-Family land use to allow for commercial as part of a mixed use project. Amend the Multi-Family land use to encourage a full range of housing types including small lot single family detached design without a requirement for a Planned Development.

High Density Residential Use: Consider deleting requirement for a Planned Development application on projects of 3 or more units per acre.

Open Space: Consider amending policy to make reference to Objective 7.6.1

Table 2-2
Consider amending table to reflect changes in density for Commercial/Mixed Use from 16 units per acre to 20 units per acre and Multi-Family from 24 units per acre to 30 units per acre.

Policy 2.2.1.5 and Table 2-3
Consider amending Policy to direct the regulation of building intensities be established in the Zoning Ordinance and delete Table 2.3.

Policies 2.2.3.1, 2.2.3.2, 2.2.5.4
Consider amending the 30% open space requirement inside of Community Regions and Rural Centers to allow lesser area of "improved open space" on site, set criteria for options in meeting a portion of the requirement off-site or by an in lieu fee option as deemed necessary.

Table 2-4
Consider amending Table 2-4 to reflect Zoning Ordinance Update revision to zones.

Policy 2.2.4.1
Consider amending the Density Bonus policy which allows incentive for the creation of open space as part of residential projects, and implement policy specifics through Zoning Ordinance.

Policy 2.2.5.4
Consider deleting policy.

Policy 2.2.5.8
Consider amending the policy requirement for a Neighborhood Services Zone and allow for objectives to be meet in a related zone.

Policy 2.2.5.10

Consider deleting requirement for special use permit for Ag Support Services; incorporate standards and permitted uses into Zoning Ordinance

Policy 2.4.1.3
Consider amending policy to recognize the historical townsites of El Dorado/Diamond Springs and other historical townsites.

Policy 2.9.1.2, 2.9.1.3 and 2.9.1.4
Consider amending criteria for establishing Community Region and Rural Center boundaries. Amend timeframe for revision by the Board of Supervisors allowing for amendments to the boundaries to be completed by Board of supervisors on an as needed basis.

New Policies
Consider setting criteria for and identify Infill sites and Opportunity areas that will provide incentives substantial enough to encourage the development of these vacant/underutilized areas. This amendment would set criteria for CEQA streamlining opportunities but would not amend land uses or go beyond existing EIR growth projections or densities set by the General Plan. These policies may support the use of Traditional Neighborhood Design guidelines, Mixed Use, and Form Base Code.

TRANSPORTATION AND CIRCULATION ELEMENT

Policy TC-1a, TC-1b, and Table TC-1
Consider revising policies, and table to bring objectives into conformance with policy TC-1p, TC-1r, TC-1t, TC-1u, TC-1w, TC-4f, TC-4i, HO-1.3, HO-1.5, HO-1.8, HO-1.18, HO-5.1 and HO-5.2, to allow for narrower streets and road ways and to support the development of housing affordable to all income levels.

Policies TC-1m, TC-1n(B), TC-1w
Consider amending policies to clean up language including; TC-1m delete "of effort"; TC-1n(B) replace accidents with crashes; and TC-1w, delete word maximum.

Table TC-2, TC-Xband TC-Xd
Consider amending or deleting Table TC-2 and maintain list outside of General Plan and amending any policies referring to Table TC-2.

Policy TC-Xb(C)
Consider amending policy TC-Xb(C) to refer to Figure TC-1 when referencing the circulation diagram.

Policy TC-Xg
Consider amending to include that each development shall also design necessary improvements as well as construct or fund them.

Policy TC-Xi
Consider amending policy to allow for coordination of regional projects to be delivered on a schedule agreed to by related regional agencies and therefore not subject to meeting the scheduling requirements of the policies of this General Plan.

Policies TC-4a, TC-4d and TC-4f
Consider amending policies to clean up language to ensure consistency with subsequent adopted plans.

Policies TC 4i, TC-5a, TC-5b and TC-5c
Consider amending policies to provide more flexibility when requiring sidewalks.

New Goal
Consider a new goal and associated policies recognizing the requirements of California Government Code § 65080(b)(2)(I) implemented through the regional Metropolitan Transportation Plans to provide CEQA streamlining opportunities for qualified projects.

New Policy
Consider a new policy that supports the development of new or substantially improved roadways to accommodate all users, including bicyclists, pedestrians, transit riders, children, older people, and disabled people, as well as motorists consistent with appropriate code requirements. Add implementation measure to update the applicable manuals and standard plans to incorporate elements in support of all users. (Assembly Bill 1358 the Complete Streets Act of 2008)

PUBLIC SERVICES AND UTILITIES ELEMENT

Policy 5.1.2.2 and Table 5-1
Consider amending policy and table to provide flexibility when achieving minimum level of service requirements consistent with related policies being considered for amendment.

Policies 5.2.1.3 and 5.3.1.1
Consider amending policies to increase flexibility for the connection to public water and wastewater systems when projects are located in a Community Regions.

PUBLIC HEALTH, SAFETY AND NOISE ELEMENT

Policy 6.4.1.4 and 6.4.1.5
Consider amending policies and remove Attachment A to address recommendations by the Office of Emergency Services and Homeland Security regarding dam failure inundation.

Policy 6.5.1.11 and Tables 6-1 thru 6-5
Consider revising existing noise standards to establish attainable noise thresholds with regard to temporary nighttime construction activities and other temporary exceedences.

Objective 6.7.1 and 6.7.5
Consider amending the General Plan Objective 6.7.1 and 6.7.5 to reflect updated air quality plan opportunities that support the adoption of a separate Air Quality - Energy Conservation Plan. Create policy(s) to implement these objectives.

CONSERVATION AND OPEN SPACE ELEMENT

Policy 7.1.2.1
Consider amending the restrictions for development on 30% slopes, and set standards in the Zoning Ordinance and Grading Ordinance.

Objective 7.6.1.3(B)
Consider amending policy to delete specific references to zones to conform with the changes proposed in the Zoning Ordinance update.

AGRICULTURE & FORESTRY

Policy 8.1.3.2

Consider amending policy to provide a limited buffer for lands within a Community Region by adding language similar to 8.4.1.2 to 8.1.3.2 to bring the forest resources and agriculture lands buffering policies, in line with one another.

Policy 8.2.4.2
Consider amending policy to eliminate special use permit requirement for visitor-serving uses and establish standards and permitted uses in the Zoning Ordinance

Policy 8.2.4.4
Consider amending policy and any related policies to allow for ranch marketing activities on grazing lands.

BE IT FURTHER RESOLVED, the Board of Supervisors intends to analyze the following policies:

Policy 2.2.1.2
<u>High Density Residential:</u> Consider analyzing the effects of increasing High Density Residential Land use density from a maximum of 5 units per acre to 8 units per acre.

Policy 2.1.1.1 and 2.1.2.1
Consider analyzing the possibility of adding new, amending or deleting existing Community Regions or Rural Center planning areas.

TC-1y
Consider analyzing the potential for deleting the El Dorado Hills Business Park employment cap limits including option identified in TC-1v.

Policy TC-Xd, TC-Xe and TC-Xf
Consider revising the policies to clarify the definition of "worsen", what action or analysis is required if the threshold of "worsen" is met, clarification of the parameters of analysis (i.e. analyis period, analysis scenarios, methods), thresholds and timing of improvements.

Policy 7.2.1.2
Consider amending policy to clarify the Mineral Resource Zones that are required to be mapped.

BE IT FURTHER RESOLVED the Board of Supervisors hereby authorizes Planning Services under the management of the Chief Administator to procede with the preparation of all necessary documentation and CEQA review requirements pursuant to the requirements of the California Environmental Quality Act.

BE IT FURTHER RESOLVED that Resolutions ROI 274-2008, ROI 110-2009 and ROI 179-2010 are hereby superseded by this resolution.

BE IT FURTHER RESOLVED that the Planning Commission and Board of Supervisors will return in a public hearing to consider the proposed amendments.

PASSED AND ADOPTED by the Board of Supervisors of the County of El Dorado at a regular meeting of said Board, held the 14 day of November, 20 11, by the following vote of said Board:

Ayes: Sweeney, Briggs, Knight, Nutting, Santiago
Noes: none
Absent: none

RESOLUTION NO. 183-2011

OF THE BOARD OF SUPERVISORS OF THE COUNTY OF EL DORADO

RESOLUTION OF INTENTION TO UNDERTAKE A COMPREHENSIVE UPDATE OF THE ZONING ORDINANCE

WHEREAS, the County of El Dorado is mandated by the State of California to maintain an adequate and proper General Plan; and

WHEREAS, the County of El Dorado adopted a General Plan in 2004; and

WHEREAS, many Policies, programs, and implementation measures are implemented through the Zoning Ordinance; and

WHEREAS, the Zoning Ordinance has not been comprehensively updated for over 30 years, yet has been amended an average of twice a year, resulting in a Zoning Ordinance that is a patchwork of provisions and dated regulations; and

WHEREAS, many State and federal regulations that affect the Zoning Ordinance are not accurately reflected in the Ordinance; and

WHEREAS, the Board of Supervisors adopted Resolution of Intention No. 44-2008,and

WHEREAS, the Board of Supervisors is considering amendments to the General Plan to address job creation, construction of housing for moderate-income families, the retention of sales taxes, and support of the agriculture and resource industries of the County that would be implemented by the Zoning Ordinance, and

WHEREAS, according to Section 17.10.010 the Zoning Ordinance amendment must be initiated by Board of Supervisors Resolution;

NOW, THEREFORE, BE IT RESOLVED that the County of El Dorado Board of Supervisors hereby authorizes the Development Services Department to proceed with the preparation of a Comprehensive Update of the Zoning Ordinance, addressing the following issues:

1. Conform the zoning map to the General Plan land use designations;

2. Eliminate conflicting provisions of the existing ordinance;

3. Include provisions in the ordinance to implement General Plan Implementation Measures LU-A, HO-6, HO-16, HS-K, CO-A, AF-A, ED-N, ED-P, ED-II, ED-JJ, ED-KK, and ED-QQ

4. Ensure that the ordinance is consistent with applicable state and federal laws;

5. Reorganize the ordinance for ease of use by the public, staff, and decision makers, including the use of tables to identify permitted uses and development standards, establishing specific use regulations for administrative review of specified uses, and providing rules of interpretation and a comprehensive glossary;

6. Create new zones to reflect current zoning needs and implement the General Plan, including the following zones: Rural Lands, Forest Resources, Agricultural Grazing, Neighborhood Service, and Limited Agriculture;

7. Delete obsolete zones, including Unclassified, Agriculture, Residential-Agricultural, and Planned Commercial;

8. Create overlay zones to more effectively implement General Plan policies;

9. Expand potential uses in the agricultural and rural lands zones to provide for opportunities for agricultural support, recreation, and rural commerce, including allowing ranch marketing on grazing land;

10. Provide a range of intensities for home occupations, based on size and zoning of parcels, addressing the use of accessory structures, customers, and employees.

11. Modify zoning for Williamson Act contracted and rolled out land to reflect the underlying General Plan land use designation;

12. Revise the zoning map to conform to standardized rule sets for zoning modifications based on the General Plan land use designations; and

13. Provide a range of commercial zones to specify and direct the type, design, and location of commercial uses.

BE IT FURTHER RESOLVED that the Board intends to have analyzed in the Environmental Impact Report for Comprehensive Zoning Ordinance Update the following options which may be included in the ordinance:

1. Create a Rural Commercial Zone that would be permitted within the Rural Regions planning concept area;

2. Increase potential uses to provide additional agricultural support, recreation, home occupation, and other rural residential, tourist serving, and commercial_uses in zones in the Rural Region;

3. Create standards (master plans) for mixed use and Traditional Neighborhood Design development to provide for a streamlined approval process and to protect the commercial viability of the site;

4. Include single family detached development standards in the Multi-Family zone. Allow up to 15% of the project area, for commercial uses as part of a mixed use development in multifamily zones.

5. Provide multiple industrial zones to specify and direct the type, design, and location of industrial uses;

6. Provide alternative means to any open space requirement as part of a planned development to provide more flexibility and incentives for infill development and focus on recreation in Community Regions and Rural Centers;

7. Amend Zoning map to include historical overlay on El Dorado and Diamond Springs in relationship to historical townsites but consistent with adopted General Plan and Zoning Ordinance policies; and

8. Codify standards for wetland and riparian setbacks.

BE IT FURTHER RESOLVED that Resolution of Intention No. 44-2008 is hereby incorporated into and superseded by this resolution.

BE IT FURTHER RESOLVED that the Planning Commission and Board of Supervisors will return in a public hearing to consider the proposed amendments.

PASSED AND ADOPTED by the Board of Supervisors of the County of El Dorado at a regular meeting of said Board, held the 14 day of November, 2011, by the following vote of said Board:

NOTICE OF PREPARATION OF
A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT (EIR)
AND NOTICE OF PUBLIC SCOPING MEETING FOR THE
EL DORADO COUNTY TARGETED GENERAL PLAN AMENDMENT AND ZONING ORDINANCE UPDATE

Date: 10/01/2012

To: Interested Parties

From: El Dorado County Chief Administrative Office

The County of El Dorado (County) will be the Lead Agency under the California Environmental Quality Act (CEQA) for preparation of an Environmental Impact Report (EIR) for the Targeted General Plan Amendment (TGPA) and Zoning Ordinance Update (ZOU). The purpose of this Notice of Preparation and Notice of Public Scoping Meeting is to request the views of public agencies and interested persons as to the scope and content of the environmental information and analyses, including the significant environmental impacts, reasonable alternatives and mitigation measures that should be included in the Draft EIR. The project description, location, and potential environmental effects are summarized in the attached materials.

The County released a Notice of Preparation on May 25, 2012 with a 45 day review period for this project. Comments received during this review period and through the Zoning Ordinance Workshop held the week of July 16, 2012 are available on the County website at http://www.edcgov.us/landuseupdate/. Documents have been revised based on current direction by the Board of Supervisors and comments received. Written comments should be directed to revisions made to the documents and sent at the earliest possible date, but not later than 30 days after the receipt of this notice. There will be another opportunity to submit detailed comments when the Draft EIR is released for public review. Please send your comments to:

Shawna Purvines, Senior Planner
Development Services Department, Planning Services
2850 Fairlane Court, Building "C"
Placerville, CA 95667

or use the Public Comment form at:

http://www.edcgov.us/landuseupdate/

The County will conduct a public agency and public scoping meeting on the project to provide additional information and to receive verbal and written input. The public meeting will include a brief overview of the project by the County staff, followed by an opportunity for public and agency comment. The public meeting will be held at the El Dorado County Planning Commission, 2850 Fairlane Court, Placerville, on October 25, 2012.

Kim Kerr
Assistant Chief Administrative Officer
Interim Department of Transportation Director

NOTICE OF PREPARATION OF
A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT (EIR)
AND NOTICE OF PUBLIC SCOPING MEETING
FOR THE
EL DORADO COUNTY TARGETED GENERAL PLAN AMENDMENT AND ZONING ORDINANCE UPDATE

Location:

This project involves changes to policies of the County General Plan and the adoption of an update to the Zoning Ordinance. These changes will take effect county-wide in those areas that under county jurisdiction. In addition, the County will consider amending the Camino/Pollock Pines Community Region Boundary and Agricultural District Boundaries in the General Plan.

Project Description:

The County is proposing a limited number of amendments to its General Plan policies and land use designations and a comprehensive update to the Zoning Ordinance. The items below are listed in no particular order of importance.

General Plan Amendments

Amendments to the General Plan are proposed for the Land Use Element; Transportation and Circulation Element; Public Services and Utilities Element; Public Health, Safety and Noise Element; Conservation and Open Space Element; and Agriculture and Forestry Element.

General Plan amendments to be addressed in the EIR are primarily policy changes, although a limited number of General Plan Land Use Designations, discussed below, are also identified for potential amendment. The EIR will analyze all of the potential amendments under consideration.

The following is a summary of the proposed policies and maps considered for analysis or amendments to the General Plan:

Land Use Map

1. Camino/Pollock Pines Community Region Boundary amendment to create three (3) Rural Centers including Camino, Cedar Grove, and Pollock Pine, to allow for separate and distinct opportunities for each of the communities.

2. Agriculture District Boundary Expansion for Garden Valley-Georgetown, Coloma, Camino-Fruitridge, Gold Hill, Oak Hill, Pleasant Valley, and Fair Play-Somerset.

3. Limited Land Use clean-up identified through the Zoning Ordinance Update.

Consider Amending the Following Policies

1. *Policy 2.1.1.3:*Commercial/Mixed Use- Amend to allow residential density by increasing residential use as part of a mixed-use development from 16 units per acre to 20 units per acre.

2. *Policy 2.2.1.2, Table 2-1, and Table 2-1*: Commercial and Industrial- Amend to allow for commercial and industrial uses in the rural regions.

3. *Policy 2.2.1.2*:Commercial/Mixed Use- Delete sentence, "The residential component of the project shall only be implemented following or concurrent with the commercial component."

4. *Policy 2.2.1.2:* Delete requirement that industrial lands be restricted to areas within, or in close proximity to community regions and rural centers. Delete the requirement that industrial lands in rural regions have more limited industrial uses, for support of agriculture and natural resource uses.

5. *Policy 2.2.1.2:* Amend multi-family density from 24 units per acre to 30 units per acre to comply with California Government Code 65583.2(c)(iv) and (e). Amend the multi-family land use to encourage a full range of housing types including small lot single family detached design without a requirement for a planned development.

6. *Policy 2.2.1.2:* High Density Residential- Delete requirement for a planned development application on projects of 3 or more units per acre.

7. *Policy 2.2.1.2:*Open Space- Amend policy to refer to Objective 7.6.1

8. *Table 2-2:* Amend table to reflect changes in density for commercial/mixed use from 16 units per acre to 20 units per acre and multi-family from 24 units per acre to 30 units per acre.

9. *Policy 2.2.1.5 and Table 2-3:* Amend policy to direct the regulation of building intensities be established in the Zoning Ordinance and delete Table 2.3.

10. *Policies 2.2.3.1, 2.2.3.2, and 2.2.5.4:* Amend the 30% open space requirement for Planned Development community regions and rural centers to allow lesser area of "improved open space" on site, and consider options to provide a portion of the required open space off-site or by an in-lieu fee option.

11. *Table 2-4:* Amend as necessary to reflect Zoning Ordinance Update revisions.

12. *Policy 2.2.4.1:* Amend the density bonus criteria, and consider placing the specifics of this policy into the Zoning Ordinance.

13. *Policy 2.2.5.4:* Delete policy requiring a Planned Development application on projects requesting the creation of 50 parcels or more.

14. *Policy 2.2.5.8:* Amend the policy creating the Neighborhood Services zone and allow for objectives to be met in a related commercial zone.

15. *Policy 2.2.5.10:* Delete policy requirement for special use permit for agriculture support services; incorporate standards and permitted into Zoning Ordinance

16. *Policy 2.4.1.3:* Amend policy to recognize the historical town sites of El Dorado/Diamond Springs and other historical town sites.

17. *Policies 2.9.1.2, 2.9.1.3, and 2.9.1.4:* Amend criteria for establishing community region and rural center boundaries by deleting the restriction that boundaries can be amended every five years, and allow revisions to the boundaries to be initiated by Board of Supervisors whenever necessary.

18. *Add New Policies that provide* set criteria for and identify infill sites and opportunity areas that will provide incentives for development of these vacant/underutilized areas, including streamlining the CEQA process for these identified locations. These policies may support the use of traditional neighborhood design guidelines, mixed use, and "form based" codes. These policy changes would not include amending the land use designations, or increasing the densities currently provided for in the General Plan.

19. *Policies TC-1a, TC-1b, and Table TC-1:* Revise policies, and table to further support the important objectives found in policies TC-1p, TC-1r, TC-1t, TC-1u, TC-1w, TC-4f, TC-4i, HO-1.3, HO-1.5, HO-1.8, HO-1.18, HO-5.1 and HO-5.2, allowing for narrower streets and road ways and to support the development of housing affordable to all income levels.

20. *Policies TC-1m, TC-1n(B), TC-1w:* Amend to make minor modifications to clarify language including; TC-1m delete "of effort"; TC-1n(B) replace accidents with crashes; and TC-1w, delete word maximum.

21. *Tables TC-2, Policy TC-Xb, and Policy TC-Xd:* Amend or delete Table TC-2; if Table TC-2 is deleted, amend all references to TC-2, including the references in TC-Xb and TC –Xd.

22. *Policy TC-Xb (C):* Consider minor amendment to refer to Figure TC-1 when referencing the circulation diagram.

23. *Policy TC-Xg:* Amend to clarify the requirement that development constructs or funds necessary road improvements, and include the requirement to design, or fund design.

24. *Policy TC-Xi:* Amend to allow for coordination of regional projects to be delivered on a schedule agreed to by related regional agencies and therefore not subject to meeting the scheduling requirements of the policies of this General Plan.

25. *Policies TC-4a, TC-4d, and TC-4f:* Amend to clean up language to ensure consistency with subsequent adopted plans.

26. *Policies TC 4i, TC-5a, TC-5b, and TC-5c*: Amend to provide more flexibility of when sidewalks are required.

27. *Add New Goal and associated policies* to provide for CEQA streamlining opportunities for qualified projects that are consistent with the Metropolitan Transportation Plans.

28. *Add New Policy* to support the development of new or substantially improved roadways to accommodate all users, including bicyclists, pedestrians, transit riders, children, older people, and disabled people, as well as motorists, to comply with Assembly Bill 1358, the Complete Streets Act of 2008. Add implementation measure to update the applicable manuals and standard plans to incorporate elements in support of all users.

29. *Objective 5.1.1, 5.1.2, and Table 5-1:* Amend as needed policy(s) and table to clarify Board authority when determining minimum level of service requirements consistent with General Plan objectives, standards, and related policies.

30. *Policy 6.4.1.4 and 6.4.1.5*: Amend policies and remove flood insurance rate maps, to address recommendations by the Office of Emergency Services and Homeland Security regarding dam failure inundation.

31. *Policy 6.5.1.11 and Tables 6-1 thru 6-5*: Amend existing noise standards to establish attainable noise thresholds with regard to temporary nighttime construction activities and other temporary exceedances.

32. *Objective 6.7.1 and 6.7.5:* Amend these objectives to reflect updated air quality plan opportunities that support the adoption of a separate Air Quality - Energy Conservation Plan.

33. *Policy 7.1.2.1:* Amend the restrictions for development on 30% slopes, and set standards in the Zoning Ordinance and Grading Ordinance.

34. *Policy 7.2.1.2 and 7.1.2.3*: Amend to clarify which mineral resource zones are required to be mapped.

35. *Objective 7.6.1.3(B):* Amend to delete specific references to zone districts to conform to the changes proposed in the Zoning Ordinance update.

36. *Policy 8.1.3.2:* Amend policy to provide a limited buffer for lands within a community region by adding language similar to Policy 8.4.1.2 to Policy 8.1.3.2.

37. *Policy 8.2.4.2: Consider* amending policy to eliminate the requirement for a special use permit for all visitor serving uses , and instead establish standards, permitted uses, and requirements for permits, in the various zone districts in the Zoning Ordinance

38. *Policy 8.2.4.4:* Consider amending the policy to allow for ranch marketing activities on grazing lands.

Consider Analyzing the Following Policies

1. *Policies 2.1.1.1 and 2.1.2.1:* Analyze the possibility of adding, amending or deleting existing Community Regions or Rural Center planning areas.

2. *Policy 2.2.1.2:* High Density Residential- Analyze the potential effects of increasing high density residential land use density from a maximum of 5 units per acre to 8 units per acre.

3. *Policy TC-1y:* Analyze the potential for deleting the El Dorado Hills Business Park employment cap limits including option identified in TC-1v.

4. *Policies TC-Xd, TC-Xe and TC-Xf:* Analyze impacts to revising the policies to clarify the definition of "worsen", to clarify what is required if a project "worsens" traffic, identifying the methodology for traffic studies (e.g. analysis period, analysis scenarios, methods), and identifying the timing of improvements.

Zoning Ordinance Update

The proposed comprehensive Zoning Ordinance Update has two elements: 1) revising the zoning maps to bring existing zoning designations into conformance with the General Plan, and 2) providing a comprehensive update of the text of the Zoning Ordinance both to bring conformance with the General Plan and to modernize implementation tools.

The following is a summary of the proposed changes:

1. Ensure that the zoning designation for all parcels in the County conforms to the General Plan land use designations for those parcels.

2. Eliminate inconsistent provisions of the existing Zoning Ordinance.

3. Include provisions in the Zoning Ordinance to implement General Plan Implementation Measures LU-A, HO-6, HO-16, HS-K, CO-A, AF-A, ED-N, ED-P, ED-II, ED-JJ, ED-KK, and ED-QQ.

4. Ensure that the Zoning Ordinance is consistent with applicable state and federal laws.

5. Reorganize the Zoning Ordinance for ease of use, including the use, including the use of tables to identify permitted uses and development standards, establishing specific use regulations for administrative review of specified uses.

6. Create new zones to reflect current zoning needs and implement the General Plan, including the following zones: Rural Lands, Forest Resources, Agricultural Grazing, Neighborhood Service, and Limited Agriculture.

7. Delete obsolete zones, including Unclassified, Agriculture, Residential-Agricultural, and Planned Commercial.

8. Create combining zone districts (e.g. Historical, Community Design, etc.) to identify land that needs additional regulation, protection of resources, protection of public health and safety, or establishes a review process to more effectively implement General Plan policies and related ordinances.

9. Expand potential uses in the agricultural and rural lands zones to provide for opportunities for agricultural support, recreation, and rural commerce, including allowing ranch marketing on grazing land.
10. Provide a range of intensities for home occupations, based on size and zoning of parcels, addressing the use of accessory structures, customers, and employees.
11. Modify zoning for Williamson Act contracted and rolled out land to reflect the underlying General Plan land use designation.
12. Revise the zoning map to conform to standardized rules (i.e. mapping criteria) for zoning modifications based on the General Plan land use designations.
13. Provide a range of commercial zones to specify and direct the type, design, and location of commercial uses. Proposed zones include Commercial Regional (CR), Commercial General (CG), Commercial Community (CC), Commercial Planned Office (CPO), Commercial Limited (CL), and Commercial Mainstreet (CM).
14. Create a Rural Commercial Zone that would be permitted within the rural regions planning concept area.
15. Increase potential uses to provide additional agricultural support, recreation, home occupation, and other rural residential, tourist serving, and commercial uses in zones in the rural region.
16. Create standards (master plans) for proposed mixed use and traditional neighborhood design development on commercial and multi-family zoned parcels to provide for a streamlined approval process and to protect the commercial viability of the parcels.
17. Include standards for single family detached development proposed in multifamily zones. Create a standard to allow a limited percentage of commercial use in proposed mixed use development in multifamily zones.
18. Provide multiple industrial zones to specify and direct the type, design, and location of industrial uses.
19. Provide alternative means to any open space requirement as part of a planned development to provide more flexibility and incentives for infill development and focus on recreation in community regions and rural centers.
20. Amend Zoning map to include a historical overlay zone district to the historical townsites of El Dorado and Diamond Springs, consistent with adopted General Plan and Zoning Ordinance policies.
21. Establish standards for wetland and riparian setbacks.
22. Provide opportunities for residential and recreational uses on Timber Production Zone land compatible with timber management and harvesting.

Project Objectives

The TGPA and Zoning Ordinance Update have the following objectives:

TGPA:

1. Establish policies related to the development of housing affordable to the moderate income earner,
2. Establish policies that will result in job creation and improved sales tax revenues,
3. Establish policies that will promote and protect agriculture in the county,
4. Establish policies consistent with SB 375 (2008) and housing element law, and
5. Revise existing General Plan policies as needed to provide clarity.

Zoning Ordinance Update:

1. Conform the zoning map to the General Plan land use designations,
2. Eliminate conflicting provisions within the existing ordinance,
3. Include provisions in the ordinance to implement General Plan Implementation Measures LU-A, HO-6, HO-16, HS-K, CO-A, AF-A, ED-N, ED-P, ED-II, ED-JJ, ED-KK, and ED-QQ,
4. Ensure that the ordinance is consistent with applicable state and federal laws,
5. Reorganize the ordinance for ease of use, including the use of tables to identify permitted uses and development standards, establishing specific use regulations for administrative review of specified uses,
6. Create new zones to reflect current zoning needs and implement the General Plan, including Rural Lands, Forest Resources, Agricultural Grazing, and Limited Agriculture,
7. Delete obsolete zones,
8. Create overlay zones to more effectively implement General Plan policies,
9. Expand potential uses in the agricultural and rural lands zones to provide for opportunities for agricultural support, recreation, and rural commerce, including allowing ranch marketing on grazing land,
10. Provide a range of intensities for home occupations, based on size and zoning of parcels, adding the use of accessory structures, customers, and employees,
11. Modify zoning for Williamson Act contracted and rolled out land to reflect the underlying General Plan land use designations,

12. Revise the zoning map to conform to standardized rules sets for zoning modifications based on the General Plan land use designations, and

13. Provide a range of commercial zones to specify and direct the type, design, and location of commercial uses, consistent with the General Plan.

Level of Detail for the Environmental Analysis in the Draft EIR

The analysis will be at a program-level. It will focus on the reasonably foreseeable direct and indirect physical environmental effects that could result from implementation of the TGPA and the ZOU. Because no specific development projects are being proposed, the analysis will not be parcel-specific.

The ZOU includes a number of optional ordinances that will be considered by the County, but which may or may not be adopted. The EIR will examine these options as part of the project and will discuss the range of impacts that could result from adopting the options as part of the ZOU.

Scope of the EIR– Potential Significant Effects

The County is preparing an Initial Study pursuant to Appendix G of the CEQA Guidelines to help identify potential significant effects to be analyzed in the Draft EIR. The following list of potentially significant effects is not intended to be comprehensive. The Draft EIR may address additional impacts as a result of the comments received on the Notice of Preparation, the scoping meetings, and the Environmental Checklist/Initial Study.

Comments and suggestions are requested regarding the environmental issues that will be analyzed in the EIR; a 45 day public comment period (instead of the normal 30 day period) is set to begin upon receipt of this Notice of Preparation.

Potentially Significant Impacts to be Addressed in the EIR

At this time, the following issues are anticipated to be addressed in the EIR:

1. Aesthetics
2. Agriculture Resources
3. Air Quality
4. Biological Resources
5. Cultural Resources
6. Greenhouse Gas Emissions
7. Land Use/Planning

8. Noise

9. Population/Housing

10. Transportation/Traffic

Less Than Significant Impacts That Will Not Be Addressed in the EIR

Based on a preliminary review of the Project, the County has determined that the proposed Project would have a less than significant impact or no impact on the CEQA issue areas identified below. This is a preliminary determination only and does not preclude the County from making a different determination upon further analysis.

The primary reasons for these preliminary determinations are as follows:

Geology/Soils

None of the proposed changes in General Plan policy or zoning regulations will result in an increased risk from geologic hazards in that no reduction in safeguards are proposed.

Hazards and Hazardous Materials

None of the proposed changes in General Plan policy or zoning regulations will result in the exposure of residents to hazards or hazardous materials. For example, no changes are proposed to regulations regarding naturally occurring asbestos.

Hydrology/Water Quality

None of the proposed changes in General Plan policy or zoning regulations will violate any water quality standards or waste discharge requirements, nor will the proposed project substantially alter or degrade groundwater supplies, existing drainage patterns, or water quality.

Mineral Resources

None of the proposed changes in General Plan policy or zoning regulations will substantively change mineral resource designations or the regulation of mineral resource recovery.

Public Services, Utilities/Service Systems

Because none of the proposed changes in General Plan policy or zoning regulations will substantively change projected population or change the amount of housing designated in the General Plan, or increase areas to be developed, the changes are not expected to substantially affect demand for public services or utilities. However, this will be reviewed in the EIR in relation to proposed changes to density at the local level.

Recreation

None of the proposed changes in General Plan policy or zoning regulations will reduce standards for recreational lands, nor will they substantially reduce recreational opportunities; therefore future recreational demands will be met during the future process of considering individual development projects.

Alternatives to be addressed in the EIR

In accordance with section 15126.6 of the State CEQA Guidelines, an EIR must "describe a range of reasonable alternatives to the Project, or to the location of the Project, which would feasibly attain most the basic objectives of the Project, but would avoid or substantially lessen any of the significant effects of the Project, and evaluate the comparative merits of the alternatives." The State CEQA Guidelines also require that a No Project Alternative be evaluated, and that under specific circumstances, an environmentally superior alternative be designated from among the remaining alternatives.

The EIR will evaluate a reasonable range of alternatives, selected by an alternatives screening analysis, which will include alternatives that meet most or all of the objectives described above, are potentially feasible, and reduce significant impacts associated with the proposed TGPA and ZOU. The EIR will include an explanation of why other alternatives were rejected from further analysis in the EIR.

The alternatives analysis may, in addition to the No Project Alternative, consider one or more of the reduced intensity alternatives for further development and analysis in the EIR. The selected alternatives will be analyzed at a qualitative level of detail for comparison against the impacts identified for the proposed Project, consistent with the requirements of CEQA. Because this is a county-wide project, no alternative will be analyzed that is outside the county.

Requests for Additional Information

If you have any questions, please contact Shawna Purvines at the County of El Dorado, Development Services Department, Planning Services, 2850 Fairlane Court, Building "C," Placerville, CA 95667, by telephone at (530) 621-5362, or by e-mail toTGPA-ZOU@edcgov.us.

The full text of the proposed changes, is available from the Development Services Department, Planning Services, 2850 Fairlane Court, Building "C," Placerville, CA 95667. The full text of the proposed changes is also available online at the Land Use Policy Programmatic Update website: http://www.edcgov.us/landuseupdate/, and at the following County libraries:

1. Main Library in Placerville, 345 Fair Lane, Placerville, CA 95667. HOURS: Tuesday & Wednesday 12-7, Thursday, Friday & Saturday 10-5, Closed Sunday & Monday

2. Cameron Park Branch 2500 Country Club Dr, Cameron Park, CA 95682 HOURS: Monday, Wednesday & Friday 10-5, Tuesday & Thursday 12-7, 2nd Saturday of each month 10-3, Closed Saturday & Sunday

3. El Dorado Hills Branch 7455 Silva Valley Parkway El Dorado Hills, CA 95762. Monday 1-5, Tuesday & Wednesday 12-7, Thursday & Friday 10-5, Saturday 1-5, Closed Sunday.

4. Georgetown Branch 6680 Orleans Street P. O. Box 55 Georgetown, CA 95634. HOURS: Tuesday & Wednesday 12-7, Thursday 10-5, Friday 1-5, Saturday 10-3, Closed Sunday & Monday.

5. Pollock Pines Branch 6210 Pony Express Trail P O Box 757 Pollock Pines, CA 95726 HOURS: Tuesday 12-7, Wednesday & Thursday 10-5, Closed Friday, Saturday, Sunday & Monday.

6. South Lake Tahoe Branch 1000 Rufus Allen Blvd South Lake Tahoe, CA 96150. HOURS: Tuesday & Wednesday 10-8, Thursday, Friday & Saturday 10-5, Closed Sunday & Monday.

Aquatic Buffer Model Ordinance

☞ *This ordinance focuses primarily on stream buffers. Communities creating coastal buffers may wish to incorporate additional features. For an example of a coastal buffer ordinance, see the Rhode Island ordinance.*

Section I. Background

Buffers adjacent to stream systems and coastal areas provide numerous environmental protection and resource management benefits that can include the following:

1) Restoring and maintaining the chemical, physical, and biological integrity of the water resources
2) Removing pollutants delivered from urban stormwater
3) Reducing erosion and sediment entering the stream
4) Stabilizing stream banks
5) Providing infiltration of stormwater runoff
6) Maintaining base flow of streams
7) Contributing the organic matter that is a source of food and energy for the aquatic ecosystem
8) Providing tree canopy to shade streams and promote desirable aquatic organisms

☞ *This benefit applies primarily to forested buffer systems. In some communities, such as prairie settings, the native vegetation may not be forest. See the example ordinance from Omaha, Nebraska, for an example.*

9) Providing riparian wildlife habitat
10) Furnishing scenic value and recreational opportunity

It is the desire of the _________________(*Natural Resources or Planning Agency*) to protect and maintain the native vegetation in riparian and wetland areas by implementing specifications for the establishment, protection, and maintenance of vegetation along all stream systems and/or coastal zones within our jurisdictional authority.

Section II. Intent

The purpose of this ordinance is to establish minimal acceptable requirements for the design of buffers to protect the streams, wetlands, and floodplains of ___________________ (*jurisdiction*); to protect the water quality of watercourses, reservoirs, lakes, and other significant water resources within _________________(*jurisdiction*); to protect ___________________'s (Jurisdiction's) riparian and aquatic ecosystems; and to provide for the environmentally sound use of ________________'s (*jurisdiction's*) land resources.

Section III. Definitions

Active Channel — The area of the stream channel that is subject to frequent flows (approximately once per one and a half years) and that includes the portion of the channel below the floodplain.

Best Management Practices (BMPs) — Conservation practices or management measures that control soil loss and reduce water quality degradation caused by nutrients, animal wastes, toxics, sediment, and runoff.

Buffer	A vegetated area, including trees, shrubs, and herbaceous vegetation, that exists or is established to protect a stream system, lake, reservoir, or coastal estuarine area. Alteration of this natural area is strictly limited.
Development	1) The improvement of property for any purpose involving building 2) Subdivision or the division of a tract or parcel of land into two or more parcels 3) The combination of any two or more lots, tracts, or parcels of property for any purpose 4) The preparation of land for any of the above purposes
Nontidal Wetlands	Those areas not influenced by tidal fluctuations that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

☞ *The definition of "nontidal wetland" here is adapted from the definition of "wetland" used by the USEPA and the US Army Corps of Engineers.*

Nonpoint Source Pollution	Pollution that is generated by various land use activities rather than from an identifiable or discrete source and is conveyed to waterways through natural processes, such as rainfall, stormwater runoff, or groundwater seepage rather than direct discharges.
One Hundred-Year Floodplain	The area of land adjacent to a stream that is subject to inundation during a storm event that has a recurrence interval of 100 years.
Pollution	Any contamination or alteration of the physical, chemical, or biological properties of any waters that will render the waters harmful or detrimental to 1) Public health, safety, or welfare 2) Domestic, commercial, industrial, agricultural, recreational, or other legitimate beneficial uses 3) Livestock, wild animals, or birds 4) Fish or other aquatic life
Stream Channel	Part of a watercourse either naturally or artificially created that contains an intermittent or perennial base flow of groundwater origin. Base flows of groundwater origin can be distinguished by any of the following physical indicators: 1) Hydrophytic vegetation, hydric soil, or other hydrologic indicators in the area(s) where groundwater enters the stream channel in the vicinity of the stream headwaters, channel bed, or channel banks 2) Flowing water not directly related to a storm event 3) Historical records of a local high groundwater table, such as well and stream gauge records.
Stream Order	A classification system for streams based on stream hierarchy. The smaller the stream, the lower its numerical classification. For example, a first-order stream

does not have tributaries and normally originates from springs and/or seeps. (See Figure 1.)

Stream System — A stream channel together with one or both of the following:
1) 100-year floodplain
2) Hydrologically related nontidal wetland

Streams — Perennial and intermittent watercourses identified through site inspection and US Geological Survey (USGS) maps. Perennial streams are those which are depicted on a USGS map with a solid blue line. Intermittent streams are those which are depicted on a USGS map with a dotted blue line.

☞ *Defining the term "stream" is perhaps the most contentious issue in the definition of stream buffers. This term determines the origin and the length of the stream buffer. Although some jurisdictions restrict the buffer to perennial or "blue line" streams, others include both perennial and intermittent streams in the stream buffer program. Some communities do not rely on USGS maps and instead prepare local maps of all stream systems that require a buffer.*

Water Pollution Hazard — A land use or activity that causes a relatively high risk of potential water pollution.

Section IV. **Applications**

A) This ordinance shall apply to all proposed development except for that development which meets waiver or variance criteria as outlined in Section IX of this regulation.
B) This ordinance shall apply to all timber harvesting activities, except those timber harvesting operations which are implementing a forest management plan that has been deemed to be in compliance with the regulations of the buffer ordinance and has received approval from _____________(*state forestry agency*).
C) This ordinance shall apply to surface mining operations except that the design standards shall not apply to active surface mining operations that are operating in compliance with an approved ______________(*state or federal agency*) surface mining permit.
D) The ordinance shall not apply to agricultural operations that are covered by an approved Natural Resources Conservation Service (NRCS) conservation plan that includes the application of BMPs.

☞ *Communities should carefully consider whether exempt agricultural operations from the buffer ordinance because buffer regulations may take land out of production and impose a financial burden on family farms. Many communities exempt agricultural operations if they have an approved NRCS conservation plan. In some regions, agricultural buffers may be funded through the Conservation Reserve Program (CRP). For further information, consult the Conservation Technology Information Center (CTIC) at www.ctic.perdue.edu.*

☞ *Livestock operations near and around streams may be regulated by communities. Livestock can significantly degrade the stream system and accelerate streambank erosion. The King County Livestock Management Ordinance is one example of a local livestock ordinance. For more information, contact the King County Department of Development and Environmental Services at (206) 296-6602.*

E) Except as provided in Section IX, this ordinance shall apply to all parcels of land, structures, and activities that are causing or contributing to

1) Pollution, including nonpoint source pollution, of the waters of the jurisdiction adopting this ordinance
2) Erosion or sedimentation of stream channels
3) Degradation of aquatic or riparian habitat

Section V. **Plan Requirements**

A) In accordance with Section IV of this ordinance, a plan approved by the appropriate agency is required for all development, forest harvesting operations, surface mining operations, and agricultural operations.
B) The plan shall set forth an informative, conceptual, and schematic representation of the proposed activity by means of maps, graphs, charts, or other written or drawn documents so as to enable the agency an opportunity to make a reasonably informed decision regarding the proposed activity.
C) The plan shall contain the following information:

☞ *The ordinance can identify the scale of maps to be included with the analyses in items 2) through 7). A 1"=50' to 1"=100' scale will generally provide sufficient detail.*

1) A location or vicinity map
2) Field-delineated and surveyed streams, springs, seeps, bodies of water, and wetlands (include a minimum of 200 feet into adjacent properties)
3) Field delineated and surveyed forest buffers
4) Limits of the ultimate 100-year floodplain

☞ *The limits of the ultimate floodplain (i.e., the floodplain under "built-out" conditions) might not be available in all locations.*

5) Hydric soils mapped in accordance with the NRCS soil survey of the site area
6) Steep slopes greater than 15 percent for areas adjacent to and within 200 feet of streams, wetlands, or other waterbodies

☞ *The ordinance may also explicitly define how slopes are measured. For example, the buffer may be divided into sections of a specific width (e.g., 25 feet) and the slope for each segment reported. Alternatively, slopes can be reported in segments divided by breaks in slope.*

7) A narrative of the species and distribution of existing vegetation within the buffer

D) The buffer plan shall be submitted in conjunction with the required grading plan for any development,and the forest buffer should be clearly delineated on the final grading plan.
E) Permanent boundary markers, in the form of signage approved by ___________(*natural resources or planning agency*), shall be installed prior to final approval of the required clearing and grading plan. Signs shall be placed at the edge of the middle zone (See Section VI.I).

Section VI. **Design Standards for Forest Buffers**

A) A forest buffer for a stream system shall consist of a forested strip of land extending along both sides of a stream and its adjacent wetlands, floodplains, or slopes. The forest buffer width shall be adjusted to include contiguous sensitive areas, such as steep slopes or erodible soils, where development or disturbance may adversely affect water quality, streams, wetlands, or other waterbodies.

B) The forest buffer shall begin at the edge of the stream bank of the active channel.
C) The required width for all forest buffers (i.e., the base width) shall be a minimum of 100 feet, with the requirement to expand the buffer depending on
   1) Stream order
   2) Percent slope
   3) 100-year floodplain
   4) Wetlands or critical areas

☞ *The width of the stream buffer varies from 20 feet to 200 feet in ordinances throughout the United States (Heraty, 1993). The width chosen by a jurisdiction will depend on the sensitivity and characteristics of the resource being protected and the political realities in the community.*

B) In third-order and higher streams, 25 feet shall be added to the base width of the forest buffer.
C) The forest buffer width shall be modified if steep slopes are within close proximity to the stream and drain into the stream system. In those cases, the forest buffer width may be adjusted.

☞ *Several methods may be used to adjust buffer width for steep slopes. Two examples ifollow:*

Method A

Percent	Width of Buffer
15%-17%	add 10 feet
18%-20%	add 30 feet
21%-23%	add 50 feet
24%-25%	add 60 feet

Method B

Percent Slope	Type of Stream Use	
	Water Contact Recreational Use	Sensitive Stream Habitat
0% to 14%	no change	add 50 feet
15% to 25%	add 25 feet	add 75 feet
Greater than 25%	add 50 feet	add 100 feet

D) Forest buffers shall be extended to encompass the entire 100-year floodplain and a zone with a minimum width of 25 feet beyond the edge of the floodplain.
E) When wetland or critical areas extend beyond the edge of the required buffer width, the buffer shall be adjusted so that the buffer consists of the extent of the wetland plus a 25-foot zone extending beyond the wetland edge.

H) Water Pollution Hazards
The following land uses and/or activities are designated as potential water pollution hazards

and must be set back from any stream or waterbody by the distance indicated below:
1) Storage of hazardous substances—(150 feet)
2) Aboveground or underground petroleum storage facilities—(150 feet)
3) Drainfields from onsite sewage disposal and treatment systems (i.e., septic systems)—(100 feet)
4) Raised septic systems—(250 feet)
5) Solid waste landfills or junkyards—(300 feet)
6) Confined animal feedlot operations—(250 feet)
7) Subsurface discharges from a wastewater treatment plant—(100 feet)
8) Land application of biosolids—(100 feet)

☞ *For surface water supplies, the setbacks should be doubled.*

☞ *A community should carefully consider which activities or land uses should be designated as potential water pollution hazards. The list of potential hazards shown above is not exhaustive, and others may need to be added depending on the major pollutants of concern and the uses of water.*

l) The forest buffer shall be composed of three distinct zones, with each zone having its own set of allowable uses and vegetative targets as specified in this ordinance. (See Figure 2.)

☞ *Although a three-zone buffer system is highly recommended, the widths and specific uses allowed in each zone may vary between jurisdictions.*

l) Zone 1, Streamside Zone
   a) Protects the physical and ecological integrity of the stream ecosystem.
   b) Begins at the edge of the stream bank of the active channel and extends a minimum of 25 feet from the top of the bank.
   c) Allowable uses within this zone are highly restricted to
      i) Flood control structures
      ii) Utility right of ways
      iii) Footpaths
      iv) Road crossings, where permitted
   d) Target for the streamside zone is undisturbed native vegetation.

☞ *This ordinance assumes that the native vegetation in the stream corridor is forest. In some regions of the United States, other vegetation such as prairie may be native. See the Omaha, Nebraska, buffer ordinance for an example of a stream buffer ordinance that protects nonforested systems.*

2) Zone 2, Middle Zone
   a) Protects key components of the stream and provides distance between upland development and the streamside zone.
   b) Begins at the outer edge of the streamside zone and extends a minimum of 50 feet plus any additional buffer width as specified in this section.
   c) Allowable uses within the middle zone are restricted to
      i) Biking or hiking paths
      ii) Stormwater management facilities, with the approval of _______________ *(local agency responsible for stormwater).*

   iii) Recreational uses as approved by ___________________ (*planning agency*).
   iv) Limited tree clearing with approval from ________________ (*forestry agency or planning agency*).
  d) Targets mature native vegetation adapted to the region.

3) Zone 3, Outer Zone
  a) Prevents encroachment into the forest buffer and filters runoff from residential and commercial development.
  b) Begins at the outward edge of the middle zone and provide a minimum width of 25 feet between Zone 2 and the nearest permanent structure.
  c) Restricts septic systems, permanent structures, or impervious cover, with the exception of paths.
  d) Encourages the planting of native vegetation to increase the total width of the buffer.

Section VII. <u>Buffer Management and Maintenance</u>

A) The forest buffer, including wetlands and floodplains, shall be managed to enhance and maximize the unique value of these resources. Management includes specific limitations on alteration of the natural conditions of these resources. The following practices and activities are restricted within Zones 1 and 2 of the forest buffer, except with approval by ____________ _____ (*forestry, planning or natural resources agency*)
  1) Clearing of existing vegetation
  2) Soil disturbance by grading, stripping, or other practices
  3) Filling or dumping
  4) Drainage by ditching, underdrains, or other systems
  5) Use, storage, or application of pesticides, except for spot spraying of noxious weeds or non-native species consistent with recommendations of _________________(*forestry agency*)
  6) Housing, grazing, or other maintenance of livestock
  7) Storage or operation of motorized vehicles, except for maintenance and emergency use approved by _____________(*forestry, planning, or natural resources agency*)

B) The following structures, practices, and activities are permitted in the forest buffer, with specific design or maintenance features, subject to the review of _______________ (*forestry, planning, or natural resources agency)*:
  1) Roads, bridges, paths, and utilities:
    a) An analysis needs to be conducted to ensure that no economically feasible alternative is available.
    b) The right-of-way should be the minimum width needed to allow for maintenance access and installation.
    c) The angle of the crossing shall be perpendicular to the stream or buffer to minimize clearing requirements
    d) The minimum number of road crossings should be used within each subdivision, and no more than one fairway crossing is allowed for every 1,000 feet of buffer.
  2) Stormwater management:
    e) An analysis needs to be conducted to ensure that no economically feasible alternative is available and that the project either is necessary for flood control or significantly improves the water quality or habitat in the stream.
    f) In new developments, onsite and nonstructural alternatives will be preferred over larger facilities within the stream buffer.

g) When constructing stormwater management facilities (i.e., BMPs), the area cleared will be limited to the area required for construction and adequate maintenance access as outlined in the most recent edition of _________________ (*refer to stormwater manual*).

☞ *Rather than placing specific stormwater BMP design criteria in an ordinance, it is often preferable to reference a manual. With this approach, specific design information can be changed over time without going through the formal process needed to change ordinance language.*

☞ *The* Maryland Stormwater Design Manual *is one example of an up-to-date stormwater design manual. For more information, go to [www.mde.state.md.us.](http://www.mde.state.md.us) Under topics, choose "Stormwater Design Manual."*

h) Material dredged or otherwise removed from a BMP shall be stored outside the buffer.

3) Stream restoration projects, facilities, and activities approved by ____________________ _ (*forestry, planning, or natural resources agency*) are permitted within the forest buffer.
4) Water quality monitoring and stream gauging are permitted within the forest buffer, as approved by _______________(*forestry, planning or natural resources agency*):.
5) Individual trees within the forest buffer that are in danger of falling, causing damage to dwellings or other structures, or causing blockage of the stream may be removed.
6) Other timber cutting techniques approved by the agency may be undertaken within the forest buffer under the advice and guidance of ____________________ (*state or federal forestry agency*) if necessary to preserve the forest from extensive pest infestation, disease infestation, or threat from fire.

C) All plans prepared for recording and all right-of-way plans shall clearly
1) Show the extent of any forest buffer on the subject property
2) Label the forest buffer
3) Provide a note to reference any forest buffer stating: "There shall be no clearing, grading, construction or disturbance of vegetation except as permitted by the agency."
4) Provide a note to reference any protective covenants governing all forest buffer areas stating: "Any forest buffer shown hereon is subject to protective covenants that may be found in the land records and that restrict disturbance and use of these areas."

D) All forest buffer areas shall be maintained through a declaration of protective covenant, which is required to be submitted for approval by _______________ (*planning board or agency*). The covenant shall be recorded in the land records and shall run with the land and continue in perpetuity.

☞ *This protective covenant can be kept either by the local government agency responsible for management of environmental resources or by an approved nonprofit organization. An example conservation easement is included later in this section.*

E) All lease agreements must contain a notation regarding the presence and location of protective covenants for forest buffer areas and shall contain information on the management and maintenance requirements for the new property owner.

F) An offer of dedication of a forest buffer area to the agency shall not be interpreted to mean that this automatically conveys to the general public the right of access to this area.

G) ________________________ (*responsible individual or group*) shall inspect the buffer annually and immediately following severe storms for evidence of sediment deposition, erosion, or concentrated flow channels and corrective actions taken to ensure the integrity and functions of the forest buffer.

☞ *A local ordinance will need to designate the individual or group responsible for buffer maintenance. Often, the responsible party will be identified in protective covenants associated with the property.*

H) Forest buffer areas may be allowed to grow into their vegetative target state naturally, but methods to enhance the successional process such as active reforestation may be used when deemed necessary by _________________ (*natural resources or forestry agency*) to ensure the preservation and propagation of the buffer area. Forest buffer areas may also be enhanced through reforestation or other growth techniques as a form of mitigation for achieving buffer preservation requirements.

☞ *Explicit forestry management criteria are often included in a forestry or natural resources conservation ordinance. An example forest conservation ordinance from Frederick County, Maryland is included in the miscellaneous ordinances section of this site.*

Section VIII. <u>Enforcement Procedures</u>

A) _________________ (*director of responsible agency)* or his/her designee is authorized and empowered to enforce the requirements of this ordinance in accordance with the procedures of this section.

B) If, upon inspection or investigation, the director or his/her designee is of the opinion that any person has violated any provision of this ordinance, he/she shall with reasonable promptness issue a correction notice to the person. Each such notice shall be in writing and shall describe the nature of the violation, including a reference to the provision within this ordinance that has been violated. In addition, the notice shall set a reasonable time for the abatement and correction of the violation.

C) If it is determined that the violation or violations continue after the time fixed for abatement and correction has expired, the director shall issue a citation by certified mail to the person who is in violation. Each such notice shall be in writing and shall describe the nature of the violation, including a reference to the provision within this ordinance that has been violated and what penalty, if any, is proposed to be assessed. The person charged has 30 days within which to contest the citation or proposed assessment of penalty and to file a request for a hearing with the director or his/her designee. At the conclusion of this hearing, the director or his/her designee will issue a final order, subject to appeal to the appropriate authority. If, within 30 days from the receipt of the citation issued by the director, the person fails to contest the citation or proposed assessment of penalty, the citation or proposed assessment of penalty shall be deemed the final order of the director.

B) Any person who violates any provision of this ordinance may be liable for any cost or expenses incurred as a result thereof by the agency.

C) Penalties that may be assessed for those deemed to be in violation may include the following:

1) A civil penalty not to exceed $1,000.00 for each violation. Every day that such violation(s) continue will be considered a separate offense.
2) A criminal penalty in the form of a fine of not more than $1,000.00 for each violation, imprisonment for not more than 90 days, or both. Every day that such violation(s) continue will be considered a separate offense.
3) Anyone who knowingly makes any false statements in any application, record, or plan required by this ordinance shall upon conviction be punished by a fine of not more than $1,000.00 for each violation, imprisonment for not more than 30 days, or both.

☞ *Specific penalties will vary between communities, and should reflect realistically enforceable penalties given the political realities of a jurisdictin.*

F) In addition to any other sanctions listed in this ordinance, a person who fails to comply with the provisions of this buffer ordinance shall be liable to the agency in a civil action for damages in an amount equal to twice the cost of restoring the buffer. Damages that are recovered in accordance with this action shall be used for the restoration of buffer systems or for the administration of programs for the protection and restoration of water quality, streams, wetlands, and floodplains.

Section IX. **Waivers/Variances**

A) This ordinance shall apply to all proposed development except for activities that were completed prior to the effective date of this ordinance and had received the following:
   1) A valid, unexpired permit in accordance with development regulations
   2) A current, executed public works agreement
   3) A valid, unexpired building permit
   4) A waiver in accordance with current development regulations.

B) The director of the agency may grant a variance for the following:
   1) Those projects or activities for which it can be demonstrated that strict compliance with the ordinance would result in a practical difficulty or financial hardship
   2) Those projects or activities serving a public need where no feasible alternative is available
   3) The repair and maintenance of public improvements where avoidance and minimization of adverse impacts to nontidal wetlands and associated aquatic ecosystems have been addressed
   4) Those developments which have had buffers applied in conformance with previously issued requirements

C) Waivers for development may also be granted in two additional forms, if deemed appropriate by the director:
   1) The buffer width made be reduced at some points as long as the average width of the buffer meets the minimum requirement. This averaging of the buffer may be used to allow for the presence of an existing structure or to recover a lost lot, as long as the streamside zone (Zone I) is not disturbed by the reduction and no new structures are built within the 100-year floodplain.
   2) ______________________ (*planning agency*) may offer credit for additional density elsewhere on the site in compensation for the loss of developable land due to the requirements of this ordinance. This compensation may increase the total number of dwelling units on the site up to the amount permitted under the base zoning.

D) The applicant shall submit a written request for a variance to the director of the agency. The application shall include specific reasons justifying the variance and any other information necessary to evaluate the proposed variance request. The agency may require an alternative analysis that clearly demonstrates that no other feasible alternatives exist and that minimal impact will occur as a result of the project or development.

E) In granting a request for a variance, the director of the agency may require site design, landscape planting, fencing, signs, and water quality best management practices to reduce adverse impacts on water quality, streams, wetlands, and floodplains.

Section X. **Conflict With Other Regulations**

Where the standards and management requirements of this buffer ordinance are in conflict with other laws, regulations, and policies regarding streams, steep slopes, erodible soils, wetlands, floodplains, timber harvesting, land disturbance activities, or other environmental protective measures, the more restrictive shall apply.

Water: Basic Information about Regulated Drinking Water Contaminants

Basic Information about Asbestos in Drinking Water

- Drinking Water Contaminants Home
- Basic Information about Drinking Water Contaminants

Asbestos at a Glance

Maximum Contaminant Level (MCL) = 7 million fibers per Liter (MFL)

Maximum Contaminant Level Goal (MCLG) = 7 MFL

Health Effects
Some people who drink water containing asbestos in excess of the MCL over many years may have an increased risk of developing benign intestinal polyps.

Drinking Water Health Advisories provide more information on health effects

Chemical Abstract Service Registry Number
1332-21-4

Sources of Contamination
Decay of asbestos cement in water mains; erosion of natural deposits

List of all Regulated Contaminants (PDF) (6 pp, 396 K, About PDF)

EPA regulates asbestos in drinking water to protect public health. Asbestos may cause health problems if present in public or private water supplies in amounts greater than the drinking water standard set by EPA.

- What is asbestos?
- Uses for asbestos.
- What are asbestos' health effects?
- What are EPA's drinking water regulations for asbestos?
- How does asbestos get into my drinking water?
- How will I know if asbestos is in my drinking water?

- How will asbestos be removed from my drinking water?
- How do I learn more about my drinking water?

What is asbestos?
Asbestos is a fibrous mineral occurring in natural deposits.

Uses for asbestos.
Because asbestos fibers are resistant to heat and most chemicals, they have been mined for use in more than 3,000 products, including roofing materials, brake pads, and cement pipe often used in distributing water to communities.

If you are concerned about asbestos in a private well, please visit:

- EPA's private drinking water wells website
- Water Systems Council website EXIT Disclaimer

What are asbestos' health effects?
Some people who drink water containing asbestos well in excess of the maximum contaminant level (MCL) for many years may have an increased risk of developing benign intestinal polyps.

This health effects language is not intended to catalog all possible health effects for asbestos. Rather, it is intended to inform consumers of some of the possible health effects associated with asbestos in drinking water when the rule was finalized.

Top of page

What are EPA's drinking water regulations for asbestos?
In 1974, Congress passed the Safe Drinking Water Act. This law requires EPA to determine the level of contaminants in drinking water at which no adverse health effects are likely to occur. These non-enforceable health goals, based solely on possible health risks and exposure over a lifetime with an adequate margin of safety, are called maximum contaminant level goals (MCLG). Contaminants are any physical, chemical, biological or radiological substances or matter in water.

The MCLG for asbestos is 7 MFL. EPA has set this level of protection based on the best available science to prevent potential health problems. EPA has set an enforceable regulation for asbestos, called a maximum contaminant level (MCL), at 7 MFL. MCLsare set as close to the health goals as possible, considering cost, benefits and the ability of public water systems to detect and remove contaminants using suitable treatment technologies. In this case, the MCL equals the MCLG, because analytical methods or treatment technology do not pose any limitation.

The Phase II Rule, the regulation for asbestos, became effective in 1992. The Safe Drinking Water Act requires EPA to periodically review the national primary drinking water regulation for each contaminant and revise the regulation, if appropriate. EPA reviewed asbestos as part of the Six Year

Review and determined that the 7 MFL MCLG and 7 MFL MCL for asbestos are still protective of human health.

- More information on the Six Year Review of Drinking Water Standards.

States may set more stringent drinking water MCLGs and MCLs for asbestos than EPA.

Top of page

How does asbestos get into my drinking water?
The major sources of asbestos in drinking water are decay of asbestos cement water mains; and erosion of natural deposits.

A federal law called the Emergency Planning and Community Right to Know Act (EPCRA) requires facilities in certain industries, which manufacture, process, or use significant amounts of toxic chemicals, to report annually on their releases of these chemicals. For more information on the uses and releases of chemicals in your state, contact the Community Right-to-Know Hotline: (800) 424-9346.

- EPA's Toxics Release Inventory (TRI) website provides information about the types and amounts of toxic chemicals that are released each year to the air, water, and land.

Top of page

How will I know if asbestos is in my drinking water?
When routine monitoring indicates that asbestos levels are above the MCL, your water supplier must take steps to reduce the amount of asbestos so that it is below that level. Water suppliers must notify their customers as soon as practical, but no later than 30 days after the system learns of the violation. Additional actions, such as providing alternative drinking water supplies, may be required to prevent serious risks to public health.

- See EPA's public notification requirements for public water systems.

If your water comes from a household well, check with your health department or local water systems that use ground water for information on contaminants of concern in your area.

- For more information on wells, go to EPA's website on private wells.

Top of page

How will asbestos be removed from my drinking water?
The following treatment method(s) have proven to be effective for removing asbestos to below 7 MFL: coagulation/filtration, direct and diatomite filtration, and corrosion control.

Top of page

How do I learn more about my drinking water?
EPA strongly encourages people to learn more about their drinking water, and to support local efforts to protect the supply of safe drinking water and upgrade the community water system. Your water bill or telephone book's government listings are a good starting point for local information.

Contact your water utility. EPA requires all community water systems to prepare and deliver an annual consumer confidence report (CCR) (sometimes called a water quality report) for their customers by July 1 of each year. If your water provider is not a community water system, or if you have a private water supply, request a copy from a nearby community water system.

- The CCR summarizes information regarding sources used (i.e., rivers, lakes, reservoirs, or aquifers), detected contaminants, compliance and educational information.
- Some water suppliers have posted their annual reports on EPA's website.

About the Data

ECHO Data

Enforcement and compliance data for:

- Air emissions
- Surface water discharges
- Hazardous waste
- Drinking water systems

ECHO data focuses on compliance- and enforcement-related information for regulated facilities, including:

- Permit data
- Inspection/compliance evaluation dates and findings
- Violations of environmental regulations
- Enforcement actions
- Penalties assessed

ECHO includes EPA, state, local and tribal environmental agency compliance and enforcement records that are contained in EPA national databases. ECHO also incorporates many EPA environmental data sets to provide additional context for analyses. Learn more about:

- ECHO Data Sources
- Data Completeness
- Data Quality
- Use of ECHO Data

Top of Page

ECHO Data Sources

Below is a summary of data included in ECHO.

Database	Description	Date Data Extracted	Expected Next Extract
FRS	The Facility Registry Service (FRS) contains facility identification information.	2/28/2015	3/4/2015
AFS	The Air Facility System (AFS) contains data regarding regulated Clean Air Act stationary sources and their compliance records. ***EPA is transitioning to a modernized data management system (ICIS-Air) to manage Clean Air Act data. During the transition period, ECHO Clean Air Act data are frozen and reflect data as of October 17, 2014. Please note that it's possible some facilities have since returned to compliance or have new violations. Clean Air Act data refreshes are expected to resume in April 2015.**	10/17/2014	None*
ICIS-Air	The Integrated Compliance Information System (ICIS) for Air contains data regarding regulated Clean Air Act stationary sources and their compliance records.	None*	April 2015
ICIS-FE&C	The Integrated Compliance Information System (ICIS) Federal Enforcement and Compliance (FE&C) contains EPA data for inspections and enforcement actions for the following environmental laws: • Clean Air Act (CAA) • Clean Water Act (CWA) • Resource Conservation and Recovery Act (RCRA) • Safe Drinking Water Act (SDWA) • Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) • Emergency Planning and Community Right-to-Know Act (EPCRA) • Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) • Marine Protection, Research, and Sanctuaries Act • Toxic Substances Control Act (TSCA).	2/27/2015	3/3/2015

ICIS-NPDES	ICIS National Pollutant Discharge Elimination System (ICIS-NPDES) contains permit information, limits, and discharge monitoring data for facilities managed under the CWA NPDES program. *Note: ICIS-NPDES includes historical data for the state of New Jersey; however, as of November 29th, 2012, the state no longer provides EPA with required data about its CWA activities.*	2/27/2015	3/3/2015
RCRAInfo	The Resource Conservation and Recovery Act Information (RCRAInfo) system includes data for hazardous waste handlers and includes information on treatment, storage, and disposal facilities regarding permit/closure status, compliance with federal and state regulations, and cleanup activities.	2/28/2015	3/4/2015
SDWIS	The Safe Drinking Water Information System (SDWIS) contains information on public water systems, including monitoring, enforcement, and violation data related to requirements established by the Safe Drinking Water Act (SDWA).	1/13/2015	4/15/2015
TRI	The Toxics Release Inventory (TRI) data include information on the release of chemicals to the environment (emitted to the air or water, or placed in some type of land disposal) and management of chemicals through recycling, energy recovery and/or treatment. *Note: As of 11/22/14, ECHO uses 2013 TRI data.*	2/28/2015	3/4/2015
EIS	The Emission Inventory System (EIS) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs). *Note: Data expected to be added in April 2015.*	NA	NA
GHG	The Greenhouse Gas Reporting Program offers public access to comprehensive greenhouse gas (GHG) data reported directly to EPA from across the country.	2/28/2015	3/4/2015
ATTAINS	The Assessment, TMDL Tracking, and ImplementatioN System (ATTAINS) contains information on water quality assessments, impaired waters, and total maximum daily loads (TMDLs), through data submitted by states under Clean Water Act sections 303(d) and 305(b).	6/20/2014	TBD

RAD	The Reach Address Database (RAD) contains location information for facilities in Water Programs that have been linked to underlying surface water features in the National Hydrology Database (NHD) Plus dataset, such as watersheds and waterbodies. RAD incorporates waterbody location information from USGS's Geographic Names Information System (GNIS). The RAD is part of the Watershed Assessment, Tracking & Environmental Results System (WATERS), which links various program databases (e.g., ICIS-NPDES, ATTAINS, BEACON, STORET) to the NHD.	6/20/2014	TBD
BEACON	The BEach Advisory and Closing Online Notification (BEACON) system contains information on state beach advisory and closing data, related to requirements established under the Beaches Environmental Assessment and Coastal Health (BEACH) Act.	6/20/2014	TBD
U.S. Census Data	U.S. Census demographic data from the Census Block Group Data (CBG) database are included. The CBG database is derived from the 2010 Census of Population and Housing Summary Tape Files 1A and 3A.	2010	NA

Note: The time period of data displayed throughout ECHO can vary:

- The past **five years** of facility inspection and enforcement data (from the date of extraction from the source database) are presented.
- The past **three years** of facility compliance data are presented as quarters of compliance (three-month periods) based on the federal fiscal year.
- All years of EPA formal enforcement action data from ICIS are available via the EPA Enforcement Case Search.
- Additional years of data are available in the ECHO Downloads.

Top of Page

Data Synchronization

- ECHO data represent "snapshots" of the original source databases and reflect the data as they existed when the data were extracted.
- Although data are routinely updated, a lag time exists (anywhere from a week up to three months) between when data are entered into the source database and when they appear in ECHO.

Data Completeness

ECHO presents data as-reported to the original source databases. Data contained in EPA national databases generally are more complete for larger facilities. When conducting analyses, understand that the types of facilities that tend to have more complete data are described differently in each source database:

- Clean Air Act facilities: active, "federally-reportable" sources.
- Clean Water Act facilities: active, "major" permittees.
- Hazardous waste facilities: operating treatment, storage, and disposal facilities and active large quantity generators.

Data for smaller facilities can vary widely (i.e., nonexistent, a partial representation, voluntarily entered by some states and not by others). Understanding the mix of required and non-required data helps with interpreting whether ECHO information is complete. Additionally, it can be helpful to consult state environmental agencies or state databases.

Additional information is available to gain a better understanding of the variability among data reporting requirements for regulated facilities:

- Data Entry Requirements – A matrix illustrating the variability of reporting requirements for the major EPA program systems utilized by ECHO (AFS, ICIS, RCRAInfo, and SDWIS). For example, states are not required to report violations occurring at Clean Water Act non-major facilities, thus data regarding violations at those facilities may not be available via ECHO. This matrix describes such requirements.
- Inspection frequencies are typically based on the size of the facility, though regulators have options for determining inspection frequency:
    - For example, large or "major" facilities may be inspected/evaluated annually, on a two-year cycle, or even several times during a year
    - Smaller facilities may be inspected/evaluated every five years
    - Compliance may be determined through means other than on-site inspections/evaluations
    - Many facilities are required to self-report certain violations
    - Inspections for smaller CAA and CWA facilities may only be tracked in a state's database and not reflected in the national database
- Information available for enforcement actions can vary:
    - Enforcement actions that have not been concluded are not displayed in ECHO (however, underlying violations are normally reported prior to completed government enforcement)
    - Criminal enforcement actions are not displayed in ECHO (although ECHO does link to the EPA criminal enforcement cases search page)
    - Note that not all violations receive formal enforcement actions - in fact, many minor violations are corrected by facilities without the need for formal action
    - Enforcement actions taken more than five years ago are not included in facility searches; however, the EPA Enforcement Cases Search (coming soon) will allow searching beyond the past five years, as will other anticipated features

  - The relevant state environmental agency may have additional information
- Data often are not complete for CWA non-major facilities, because EPA has not finalized regulations requiring entry of such data.
- Generate a comparative map by selecting the Water tab, choose "Facilities Reporting Discharge Monitoring Reports" and click "Refresh Map" to view completeness of compliance information presented in ECHO.
- Annual Noncompliance Reports provide summary noncompliance data for CWA non-major facilities. Data from recent reports are displayed on ECHO, as are links to the reports.
- Guide to Regulated Facilities
- More State Data through state environmental agency websites

Top of Page

Data Quality

EPA, authorized or delegated states, tribal and local jurisdictions conduct compliance assurance and enforcement activities related to federal environmental laws. Each level of government works to ensure that information contained in national databases is accurate. The migration of data from many jurisdictions to multiple national program databases is a challenging task. Some state and local jurisdictions directly enter data to national databases, while others maintain their own databases and transfer data to EPA through batch processing. Under both approaches, steps are taken to ensure that the data are of the highest quality (e.g., each national database maintains standards and procedures for ensuring data integrity on a day-to-day basis).

Data are continuously evaluated. Through periodic analysis, conference calls, and national meetings, database managers at all levels of government work to ensure quality information. Additionally:

- Error reporting is available in ECHO to communicate and correct errors that are identified while using the website.
- Known data problems are noted on the site.

Top of Page

Use of ECHO Data

The information contained in ECHO is made available to the public by the U.S. Environmental Protection Agency (EPA) for information purposes only. No warranty, express or implied, is made by EPA or any other agency of the U.S. Government regarding the accuracy or completeness of this information.

ECHO is not designed for large scale data transfers or robotic queries. EPA reserves the right to disable users that initiate robotic, programmed queries.

1. A Consumer's Guide To The Nation's Drinking Water

The United States enjoys one of the best supplies of drinking water in the world. Nevertheless, many of us who once gave little or no thought to the water that comes from our taps are now asking the question: "Is my water safe to drink?" While tap water that meets federal and state standards is generally safe to drink, threats to drinking water are increasing. Short-term disease outbreaks and water restrictions during droughts have demonstrated that we can no longer take our drinking water for granted.

Consumers have many questions about their drinking water. How safe is my drinking water? What is being done to improve security of public water systems? Where does my drinking water come from, and how is it treated? Do private **wells** receive the same protection as public water systems? What can I do to help protect my drinking water?

This booklet provides the answers to these and other frequently asked questions.

This booklet also directs you to more detailed sources of information. Often, you will be directed to a page on the EPA website. Additionally, the Safe Drinking Water Hotline is available to answer your questions. Please also see Appendix C for more resources. Refer to the Glossary (Appendix D) for definitions of words in bold font.

What you need to know to protect your family

Sensitive Subpopulations

Some people may be more vulnerable to contaminants in drinking water than the general population. People undergoing chemotherapy or living with HIV/AIDS, transplant patients, children and infants, the frail elderly, and pregnant women and their fetuses can be particularly at risk for infections.

If you have special health care needs, consider taking additional precautions with your drinking water, and seek advice from your health care provider. For more information, see www.epa.gov/safewater/healthcare/special.html.

You will find information on bottled water and home water treatment units on page 16 of this booklet. You may also contact NSF International, Underwriter's Laboratory, or the Water Quality Association. Contact information is located in Appendix C.

2. How Safe Is My Drinking Water?

What Law Keeps My Drinking Water Safe?

Congress passed the Safe Drinking Water Act (SDWA) in 1974 to protect public health by regulating the nation's public drinking water supply and protecting sources of drinking water. SDWA is administered by the U.S. Environmental Protection Agency (EPA) and its state partners.

Highlights of the Safe Drinking Water Act

- Authorizes EPA to set enforceable health standards for contaminants in drinking water
- Requires public notification of water systems violations and annual reports (Consumer Confidence Reports) to customers on contaminants found in their drinking water - www.epa.gov/safewater/ccr
- Establishes a federal-state partnership for regulation enforcement
- Includes provisions specifically designed to protect underground sources of drinking water - www.epa.gov/safewater/uic
- Requires disinfection of surface water supplies, except those with pristine, protected sources
- Establishes a multi-billion-dollar state revolving loan fund for water system upgrades - www.epa.gov/safewater/dwsrf
- Requires an assessment of the vulnerability of all drinking water sources to contamination - www.epa.gov/safewater/protect

— Drinking Water: Past, Present, and Future EPA-816-F-00-002

What Is A Public Water System?

The Safe Drinking Water Act (SDWA) defines a **public water system (PWS)** as one that serves piped water to at least 25 persons or 15 service connections for at least 60 days each year. There are approximately 161,000 public water systems in the United States.[1] Such systems may be publicly or privately owned. **Community water systems (CWSs)** are public water systems that serve people year-round in their homes. Most people in the U.S. (268 million) get their water from a community water system. EPA also regulates other kinds of public water systems,

Public Water Systems

Community Water System (54,000 systems)—A public water system that serves the same people year-round. Most residences are served by Community Water Systems.

Non-Community Water System (approximately 108,000 systems)—A public water system that does not serve the same people year-round. There are two types of non-community systems:

- Non-Transient Non-Community Water System (almost 19,000 systems)—A non-community water system that serves the same people more than six months of the year, but not year-round. For example, a school with its own water supply is considered a non-transient system.
- Transient Non-Community Water System (more than 89,000 systems)—A non-community water system that serves the public but not the same individuals for more than six months. For example, a rest area or a campground may be considered a transient system.

such as those at schools, campgrounds, factories, and restaurants. Private water supplies, such as household wells that serve one or a few homes, are not regulated by EPA. For information on household wells, see "How Safe Is The Drinking Water In My Household Well?" on page 18 of this booklet.

Cost of Making Water Safe Continues to Rise

Much of the existing water infrastructure (underground pipes, treatment plants, and other facilities) was built many years ago. In 1999, EPA conducted the second Drinking Water Infrastructure Needs Survey, and found that drinking water systems will need to invest $150 billion over a 20-year period to ensure clean and safe drinking water.

Will Water Systems Have Adequate Funding In The Future?

Nationwide, drinking water systems have spent hundreds of billions of dollars to build drinking water treatment and **distribution systems**. From 1995 to 2000, more than $50 billion was spent on capital investments to fund water quality improvements.[2]

With the aging of the nation's infrastructure, the clean water and drinking water industries face a significant challenge to sustain and advance their achievements in protecting public health. EPA's *Clean Water & Drinking Water Infrastructure Gap Analysis*[3] has found that if present levels of spending do not increase, there will be a significant funding gap by the year 2019.

Where Can I Find Information About My Local Water System?

Since 1999, water suppliers have been required to provide annual Consumer Confidence Reports to their customers. These reports are due by July 1 each year, and contain information on contaminants found in the drinking water, possible health effects, and the water's source. Some Consumer Confidence Reports are available at *www.epa.gov/safewater/dwinfo.htm.*

Water suppliers must promptly inform you if your water has become contaminated by something that can cause immediate illness. Water suppliers have 24 hours to inform their customers of **violations** of EPA standards "that have the potential to have serious adverse effects on human health as a result of short-term exposure." If such a violation occurs, the water system will announce it through the media, and must provide information about the potential adverse effects on human health, steps the system is taking to correct the violation, and the need to use alternative water supplies (such as boiled or bottled water) until the problem is corrected.

Systems will inform customers about violations of less immediate concern in the first water bill sent after the violation, in a Consumer Confidence Report, or by mail within a year. In 1998, states began compiling information on individual systems, so you can evaluate the overall quality of drinking water in your state. Additionally, EPA must compile and summarize the state reports into an annual report on the condition of the nation's drinking water. To view the most recent annual report, see *www.epa.gov/safewater/annual.*

How Often Is My Water Supply Tested?

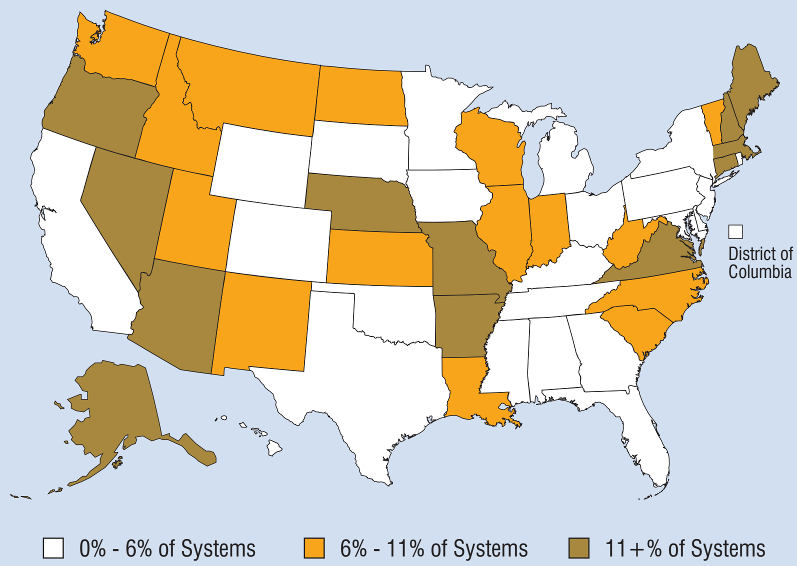
EPA has established pollutant-specific minimum testing schedules for public water systems. To find out how frequently your drinking water is tested, contact your water system or the agency in your state in charge of drinking water.

If a problem is detected, immediate retesting requirements go into effect along with strict instructions about how the system informs the public. Until the system can reliably demonstrate that it is free of problems, the retesting is continued.

In 2001, one out of every four community water systems did not conduct testing or report the results for all of the monitoring required to verify the safety of their drinking water.[4] Although failure to monitor does not necessarily suggest safety problems, conducting the required reporting is crucial to ensure that problems will be detected. Consumers can help make sure certain monitoring and reporting requirements are met by first contacting their state drinking water agency to determine if their water supplier is in compliance. If the water system is not meeting the requirements, consumers can work with local and state officials and the water supplier to make sure the required monitoring and reporting occurs.

A network of government agencies monitor tap water suppliers and enforce drinking water standards to ensure the safety of public water supplies. These agencies include EPA, state departments of health and environment, and local public health departments.

Reported Community Water Systems Violating Maximum Contaminant Levels or Treatment Standards in FY 2002



Nevertheless, problems with local drinking water can, and do, occur.

Common Sources of Pollution

Naturally Occurring: microorganisms (wildlife and soils), radionuclides (underlying rock), nitrates and nitrites (nitrogen compounds in the soil), heavy metals (underground rocks containing arsenic, cadmium, chromium, lead, and selenium), fluoride.

Human Activities: bacteria and nitrates (human and animal wastes—septic tanks and large farms), heavy metals (mining construction, older fruit orchards), fertilizers and pesticides (used by you and others (anywhere crops or lawns are maintained)), industrial products and wastes (local factories, industrial plants, gas stations, dry cleaners, leaking underground storage tanks, landfills, and waste dumps), household wastes (cleaning solvents, used motor oil, paint, paint thinner), lead and copper (household plumbing materials), water treatment chemicals (wastewater treatment plants).

What Problems Can Occur?

Actual events of drinking water contamination are rare, and typically do not occur at levels likely to pose health concerns. However, as development in our modern society increases, there are growing numbers of activities that can contaminate our drinking water. Improperly disposed-of chemicals, animal and human wastes, wastes injected underground, and naturally occurring substances have the potential to contaminate drinking water. Likewise, drinking water that is not properly treated or disinfected, or that travels through an improperly maintained distribution system, may also pose a health risk. Greater vigilance by you, your water supplier, and your government can help prevent such events in your water supply.

Contaminants can enter water supplies either as a result of human and animal activities, or because they occur naturally in the environment. Threats to your drinking water may exist in your neighborhood, or may occur many miles away. For more information on drinking water threats, see *www.epa.gov/safewater/*

publicoutreach/landscapeposter.html. Some typical examples are microbial contamination, chemical contamination from fertilizers, and lead contamination.

Boil Water Notices for Microbial Contaminants

When microorganisms such as those that indicate fecal contamination are found in drinking water, water suppliers are required to issue "Boil Water Notices." Boiling water for one minute kills the microorganisms that cause disease. Therefore, these notices serve as a precaution to the public. www.epa.gov/safewater/faq/emerg.html

Microbial Contamination:

The potential for health problems from microbial-contaminated drinking water is demonstrated by localized outbreaks of waterborne disease. Many of these outbreaks have been linked to contamination by bacteria or viruses, probably from human or animal wastes. For example, in 1999 and 2000, there were 39 reported disease outbreaks associated with drinking water, some of which were linked to public drinking water supplies.[5]

Certain **pathogens** (disease-causing **microorganisms**), such as ***Cryptosporidium***, may occasionally pass through water filtration and disinfection processes in numbers high enough to cause health problems, particularly in vulnerable members of the population. *Cryptosporidium* causes the gastrointestinal disease, cryptosporidiosis, and can cause serious, sometimes fatal, symptoms, especially among sensitive members of the population. (See box on Sensitive Subpopulations on page 1.) A serious outbreak of cryptosporidiosis occurred in 1993 in Milwaukee, Wisconsin, causing more than 400,000 persons to be infected with the disease, and resulting in at least 50 deaths. This was the largest recorded outbreak of waterborne disease in United States history.[6]

Excessive levels of nitrates can cause "blue baby syndrome," which can be fatal without immediate medical attention.

Chemical Contamination From Fertilizers:

Nitrate, a chemical most commonly used as a fertilizer, poses an immediate threat to infants when it is found in drinking water at levels above the national standard. Nitrates are converted to nitrites in the intestines. Once absorbed into the bloodstream, nitrites prevent hemoglobin from transporting oxygen. (Older children have an enzyme that restores hemoglobin.) Excessive levels can cause "blue baby syndrome," which can be fatal without immediate medical attention. Infants most at risk for blue baby syndrome are those who are already sick, and while they are sick, consume food that is high in nitrates or drink water or formula mixed with water that is high in nitrates. Avoid using water with high nitrate levels for drinking. This is especially important for infants and young children, nursing mothers, pregnant women and certain elderly people.

Nitrates: Do NOT Boil

Do NOT boil water to attempt to reduce nitrates. Boiling water contaminated with nitrates increases its concentration and potential risk. If you are concerned about nitrates, talk to your health care provider about alternatives to boiling water for baby formula.

Lead Contamination:

Lead, a metal found in natural deposits, is commonly used in household plumbing materials and water service lines. The greatest exposure to lead is swallowing lead paint chips or breathing in lead dust. But lead in drinking water can also cause a variety of adverse health effects. In babies and children, exposure to lead in drinking water above the **action level** of lead (0.015 milligram per liter) can result in delays in physical and mental development, along with slight deficits in attention span and learning abilities. Adults who drink this water over many years could develop kidney problems or high blood pressure. Lead is rarely found in source water, but enters tap water through corrosion of plumbing materials. Very old and poorly maintained homes may be more likely to have lead pipes, joints, and solder. However, new homes are also at risk: pipes legally considered to be "lead-free" may contain up to eight percent lead. These pipes can leach significant amounts of lead in the water for the first several months after their installation. For more information on lead contamination, see *www.epa.gov/safewater/contaminants/dw_contamfs/lead.html.*

Lead: Do NOT Boil

Do NOT boil water to attempt to reduce lead. Boiling water increases lead concentration. Always use water from the cold tap for preparing baby formula, cooking, and drinking. Flush pipes first by running the water before using it. Allow the water to run until it's cold. If you have high lead levels in your tap water, talk to your health care provider about alternatives to using boiled water in baby formula.

For more information on drinking water contaminants that are regulated by EPA, see Appendix A, or visit *www.epa.gov/safewater/mcl.html.*

Where Can I Find More Information About My Drinking Water?

Drinking water varies from place to place, depending on the water's source and the treatment it receives. If your drinking water comes from a community water system, the system will deliver to its customers annual drinking water quality reports (or Consumer Confidence Reports). These reports will tell consumers what contaminants have been detected in their drinking water, how these detection levels compare to drinking water standards, and where their water comes from. The reports must be provided annually before July 1, and, in most cases, are mailed directly to customers' homes. Contact your water supplier to get a copy of your report, or see if your report is posted online at *www.epa.gov/safewater/dwinfo.htm.* Your state's department of health or environment can also be a valuable source of information. For help in locating these agencies, call the Safe Drinking Water Hotline. Further resources can be found in Appendix C. Information on testing household wells is on page 19.

3. Where Does My Drinking Water Come From And How Is It Treated?

Your drinking water comes from **surface water** or **ground water**. The water that systems pump and treat from sources open to the atmosphere, such as rivers, lakes, and reservoirs is known as surface water. Water pumped from wells drilled into underground **aquifers**, geologic formations containing water, is called ground water. The quantity of water produced by a well depends on the nature of the rock, sand, or soil in the aquifer from which the water is drawn. Drinking water wells may be shallow (50 feet or less) or deep (more than 1,000 feet). More water systems have ground water than surface water as a source (approx. 147,000 v. 14,500), but more people drink from a surface water system (195 million v. 101,400). Large-scale water supply systems tend to rely on surface water resources, while smaller water systems tend to use ground water. Your water utility or public works department can tell you the source of your public water supply.

How Does Water Get To My Faucet?

An underground network of pipes typically delivers drinking water to the homes and businesses served by the water system. Small systems serving just a handful of households may be relatively simple, while large metropolitan systems can be extremely complex—sometimes consisting of thousands of miles of pipes serving millions of people. Drinking water must meet required health standards when it leaves the treatment plant. After treated water leaves the plant, it is monitored within the distribution system to identify and remedy any problems such as water main breaks, pressure variations, or growth of microorganisms.

How Is My Water Treated To Make It Safe?

Water utilities treat nearly 34 billion gallons of water every day.[1] The amount and type of treatment applied varies with the source and quality of the water. Generally, surface water systems require more treatment than ground water systems because they are directly exposed to the atmosphere and runoff from rain and melting snow.

Water suppliers use a variety of treatment processes to remove contaminants from drinking water. These individual processes can be arranged in a "treatment train" (a series of processes applied in a sequence). The most commonly used processes include coagulation (flocculation and sedimentation), filtration, and disinfection. Some water systems also use ion exchange and adsorption. Water utilities select the treatment combination most appropriate to treat the contaminants found in the **source water** of that particular system.

Coagulation (Flocculation & Sedimentation):

Flocculation: This step removes dirt and other particles suspended in the water. Alum and iron salts or synthetic organic polymers are added to the water to form tiny sticky particles called "floc," which attract the dirt particles.

All sources of drinking water contain some naturally occurring contaminants. At low levels, these contaminants generally are not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and may even have nutritional value at low levels.

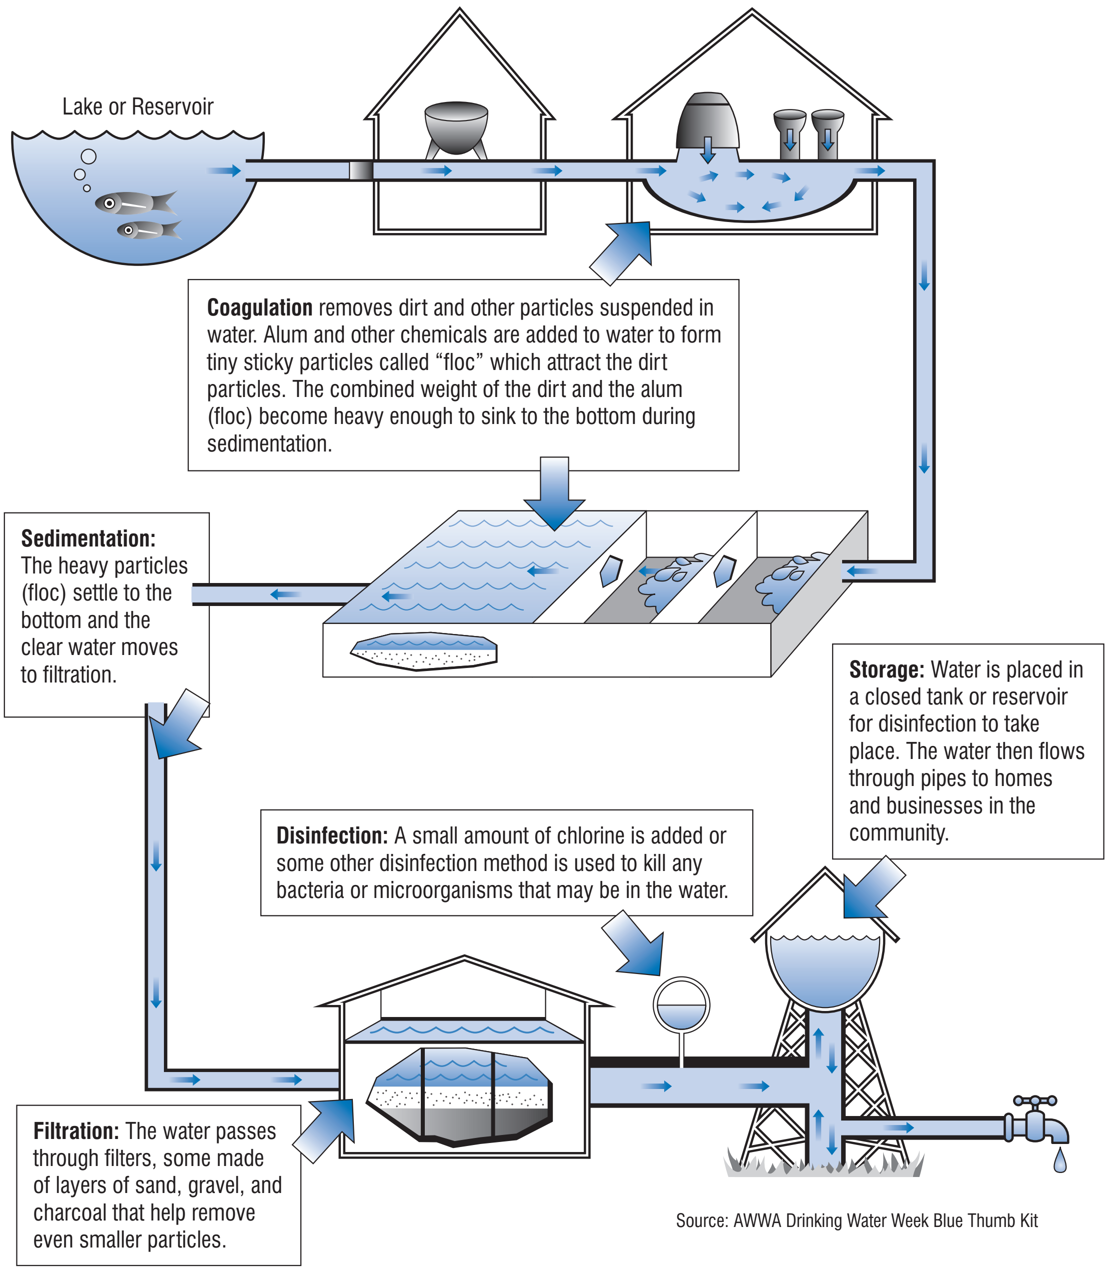
Sedimentation: The flocculated particles then settle naturally out of the water.

Filtration:

Many water treatment facilities use filtration to remove all particles from the water. Those particles include clays and silts, natural organic matter, precipitates from other treatment processes in the facility, iron and manganese, and microorganisms. Filtration clarifies the water and enhances the effectiveness of disinfection.

Water Treatment Plant

Follow a drop of water from the source through the treatment process. Water may be treated differently in different communities depending on the quality of the water which enters the plant. Groundwater is located underground and typically requires less treatment than water from lakes, rivers, and streams.



Source: AWWA Drinking Water Week Blue Thumb Kit

Disinfection:

Disinfection of drinking water is considered to be one of the major public health advances of the 20th century. Water is often disinfected before it enters the distribution system to ensure that dangerous microbial contaminants are killed. Chlorine, chlorinates, or chlorine dioxides are most often used because they are very effective **disinfectants**, and residual concentrations can be maintained in the water system.

Water System Filtration Tank

Why Is My Water Bill Rising?

The cost of drinking water is rising as suppliers meet the needs of aging infrastructure, comply with public health standards, and expand service areas. In most cases, these increasing costs have caused water suppliers to raise their rates. However, despite rate increases, water is generally still a bargain compared to other utilities, such as electricity and phone service. In fact, in the United States, combined water and sewer bills average only about 0.5 percent of household income.[2]

1 *Protect Your Drinking Water*, 2002.

2 *Congressional Budget Office Study: Future Investment in Drinking Water & Wastewater Infrastructure, 2002.*

Disinfection Byproducts

Disinfection of drinking water is one of the major public health advances of the 20th century. However, sometimes the disinfectants themselves can react with naturally occurring materials in the water to form unintended byproducts, which may pose health risks. EPA recognizes the importance of removing microbial contaminants while simultaneously protecting the public from disinfection byproducts, and has developed regulations to limit the presence of these byproducts. For more information, see www.epa.gov/safewater/mdbp.html.

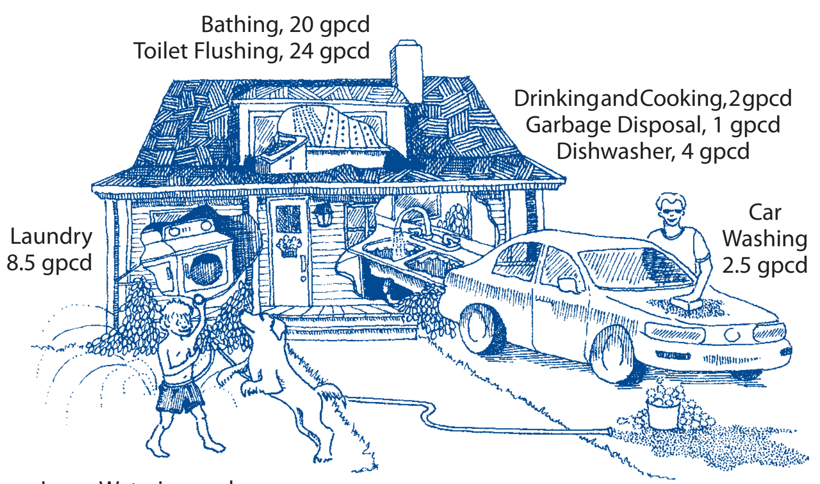
Water passes through charcoal, sand, and gravel layers in a water system's filtration tank.

4. How Do We Use Drinking Water In Our Homes?

We take our water supplies for granted, yet they are limited. Only one percent of all the world's water can be used for drinking. Nearly 97 percent of the world's water is salty or otherwise undrinkable, and the other two percent is locked away in ice caps and glaciers. There is no "new" water: whether our source water is a stream, river, lake, spring, or well, we are using the same water the dinosaurs used millions of years ago.

Common Household Uses of Drinking Water*

(*Gallons per Capita per Day)



Source: Van Der Leeden, F., F. L. Troise, and D. K. Todd. The Water Encyclopedia. Lewis Publishers, Inc. Second Edition, 1990.

The average American uses about 90 gallons of water each day in the home, and each American household uses approximately 107,000 gallons of water each year.[1] For the most part, we use water treated to meet drinking water standards to flush toilets, water lawns, and wash dishes, clothes, and cars. In fact, 50-70 percent of home water is used for watering lawns and gardens.[2] Nearly 14 percent of the water a typical homeowner pays for is never even used—it leaks down the drain.[3]

How Much Water Do Homes In The U.S. Use Compared To Other Countries?

Americans use much more water each day than individuals in both developed and undeveloped countries: For example, the average European uses 53 gallons; the average Sub-Saharan citizen, 3-5 gallons.[4]

Water efficiency plays an important role in protecting water sources and improving water quality. By using water wisely, we can save money and help the environment. Water efficiency means using less water to provide the same benefit. Using water-saving techniques could save you hundreds of dollars each year, while also reducing the amount of pollutants entering our waterways.

How Do Drinking Water Utilities Conserve Water?

Water utilities forecast water source availability, growth in population, and water demand to ensure adequate future water supplies during normal conditions, as well as periods of drought. When water shortages are predicted or experienced, water utilities have many options for conserving water. Temporary cutbacks or permanent operating adjustments can help conserve water.

Temporary cutbacks may include:

- Reduction of system-wide operating pressure, and
- Water use bans, restrictions, and rationing.

Permanent conservation measures may include:

- Subsidizing use of water-efficient faucets, toilets, and showerheads,
- Public education and voluntary use reduction,
- Billing practices that impose higher rates for higher amounts of water use,
- Building codes that require water-efficient fixtures and appliances,
- Leak detection surveys and meter testing, repair, and replacement, and
- Reduction in use and increase in recycling of industrial water.

How Can Businesses Conserve Water?

The industrial and commercial sectors can conserve water through recycling and waste reduction. Industry has implemented conservation measures to comply with state and federal water pollution controls. Evaluation of industrial plant data may show that a particular process or manufacturing step uses the most water or causes the greatest contamination. Such areas can be targeted for water conservation. Also, water that is contaminated by one process may be usable in other plant processes that do not require high-quality water.

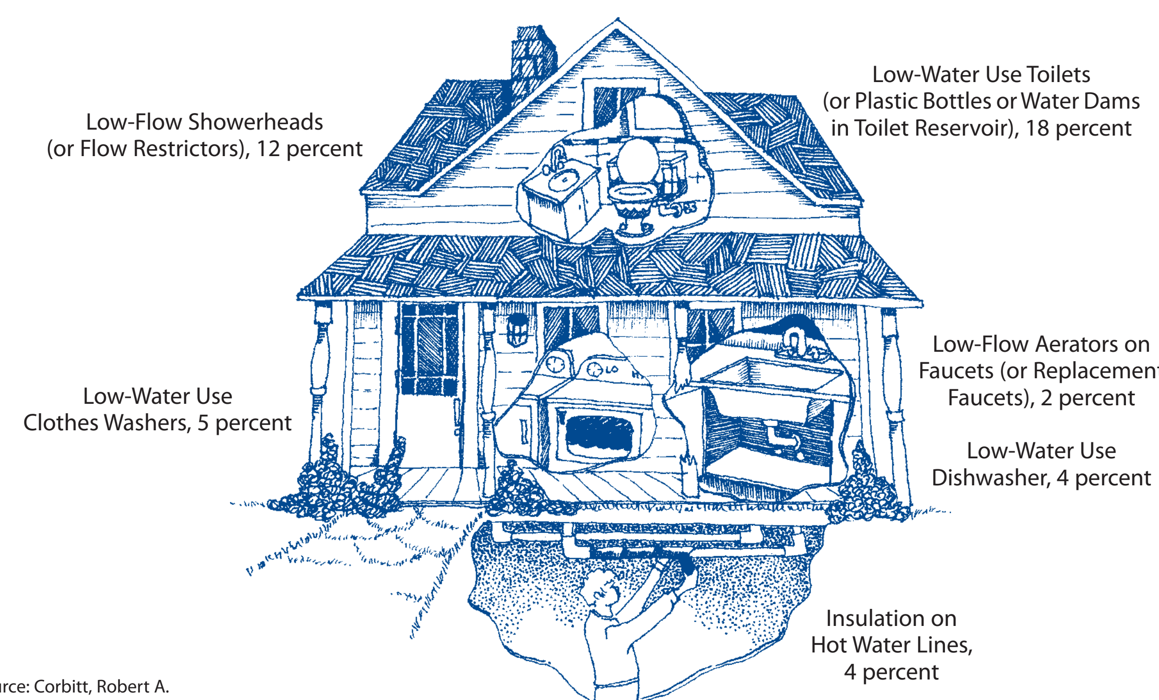
How Can I Conserve Water?

The national average cost of water is $2.00 per 1,000 gallons. The average American family spends about $474 each year on water and sewage charges.[5] American households spend an additional $230 per year on water heating costs.[6] By replacing appliances such as the dishwasher and inefficient fixtures such as toilets and showerheads, you can save a substantial amount each year in water, sewage, and energy costs.

There are many ways to save water in and around your home. Here are the five that might get the best results:

Ways To Save Water At Home*

(*Water Savings as Percent of Total Interior Water Use)



Source: Corbitt, Robert A. Standard Handbook of Environmental Engineering. McGraw-Hill, Inc. 1989.

- *Stop Leaks.*
- *Replace Old Toilets* with models that use 1.6 gallons or less per flush.
- *Replace Old Clothes Washers* with EPA Energy Star certified models.
- *Plant the Right Kind of Garden* that requires less water.
- *Provide Only the Water Plants Need.*

For more information on ways to conserve water in the home, see *www.epa.gov/water/waterefficiency.html* or *www.h2ouse.org.*

5. What's Being Done To Improve Water Security?

What Security Measures Are In Place To Protect Water Systems?

Drinking water utilities today find themselves facing new responsibilities due to concerns over water system security and counter-terrorism. EPA is committed to the safety of public drinking water supplies and has taken numerous steps to work with utilities, other government agencies, and law enforcement to minimize threats.

The Public Health Security and Bioterrorism Preparedness and Response Act of 2002 requires that all community water systems serving more than 3,300 people evaluate their susceptibility to potential threats and identify corrective actions. EPA has provided assistance to help utilities with these **Vulnerability Assessments** by giving direct grants to large systems, supporting self-assessment tools, and providing technical help and training to small and medium utilities. For more information on water system security, see *www.epa.gov/safewater/security.*

How Can I Help Protect My Drinking Water?

Local drinking water and wastewater systems may be targets for terrorists and other would-be criminals

wishing to disrupt and cause harm to your community water supplies or wastewater facilities.

Because utilities are often located in isolated areas, drinking water sources and wastewater collection systems may cover large areas that are difficult to secure and patrol. Residents can be educated to notice and report any suspicious activity in and around local water utilities. Any residents interested in protecting their water resources and community as a whole can join together with law enforcement, neighborhood watch groups, water suppliers, wastewater operators, and other local public health officials. If you witness suspicious activities, report them to your local law enforcement authorities.

Examples of suspicious activity might include:

- People climbing or cutting a utility fence
- People dumping or discharging material to a water reservoir

- Unidentified truck or car parked or loitering near waterway or facilities for no apparent reason
- Suspicious opening or tampering with manhole covers, fire hydrants, buildings, or equipment

- People climbing or on top of water tanks
- People photographing or videotaping utility facilities, structures or equipment
- Strangers hanging around locks or gates

Report suspicious activity to local authorities

Do not confront strangers. Instead report suspicious activities to local authorities.

When reporting an incident:

- State the nature of the incident
- Identify yourself and your location
- Identify location of activity
- Describe any vehicle involved (color, make, model, plate number)
- Describe the participants (how many, sex, race, color of hair, height, weight, clothing)

For emergencies, dial 9-1-1 or other local emergency response numbers.

For more information on water security, visit:
www.epa.gov/safewater/security

6. What Can I Do If There Is A Problem With My Drinking Water?

Local incidents, such as spills and treatment problems, can lead to short-term needs for alternative water supplies or in-home water treatment. In isolated cases, individuals may need to rely on alternative sources for the long term, due to their individual health needs or problems with obtaining new drinking water supplies.

What Alternative Sources Of Water Are Available?

Bottled water is sold in supermarkets and convenience stores. Some companies lease or sell water dispensers or bubblers and regularly deliver large bottles of water to homes and businesses. It is expensive compared to water from a public water system. The bottled water quality varies among brands, because of the variations in the source water used, costs, and company practices.

The U.S. Food and Drug Administration (FDA) regulates bottled water used for drinking. While most consumers assume that bottled water is at least as safe as tap water, there are still potential risks. Although required to meet the same safety standards as public water supplies, bottled water does not undergo the same testing and reporting as water from a treatment facility. Water that is bottled and sold in the same state may not be subject to any federal standards at all. Those with compromised immune systems may want to read bottled water labels to make sure more stringent treatments have been used, such as reverse osmosis, distillation, UV radiation, or filtration by an absolute 1 micron filter.

Check with NSF International to see if your bottled water adheres to FDA and international drinking water standards. The International Bottled Water Association can also provide information on which brands adhere to even more stringent requirements. Contact information is listed in Appendix C.

Can I Do Anything In My House To Improve The Safety Of My Drinking Water?

Most people do not need to treat drinking water in their home to make it safe. However, a home water treatment unit can improve water's taste, or provide a factor of safety for those people more vulnerable to waterborne disease. There are different options for home treatment systems. Point-of-use (POU) systems treat water at a single tap. Point-of-entry (POE) systems treat water used throughout the house. POU systems can be installed in various places in the home, including the counter top, the faucet itself, or under the sink. POE systems are installed where the water line enters the house.

POU and POE devices are based on various contaminant removal technologies. Filtration, ion exchange, reverse osmosis, and distillation are some of the treatment methods used. All types of units are generally available from retailers, or by mail order. Prices can reach well into the hundreds and sometimes thousands of dollars, and depending on the method and location of installation, plumbing can also add to the cost.

TREATMENT DEVICE	WHAT IT DOES TO WATER	TREATMENT LIMITATIONS
Activated Carbon Filter (includes mixed media that remove heavy metals)	√ Adsorbs organic contaminants that cause taste and odor problems. √ Somedesigns remove chlorination byproducts; √ Some types remove cleaning solvents and pesticides	Is efficient in removing metals such as lead and copper Does not remove nitrate, bacteria or dissolved minerals
Ion Exchange Unit (with activated alumina)	√ Removes minerals, particularly calcium and magnesium that make water "hard" √ Some designs remove radium and barium √ Removes fluoride	If water has oxidized iron or iron bacteria, the ion-exchange resin will become coated or clogged and lose its softening ability
Reverse Osmosis Unit (with carbon)	√ Removes nitrates, sodium, other dissolved inorganics and organic compounds √ Removes foul tastes, smells or colors √ May also reduce the level of some pesticides, dioxins and chloroform and petrochemicals	Does not remove all inorganic and organic contaminants
Distillation Unit	√ Removes nitrates, bacteria, sodium, hardness, dissolved solids, most organic compounds, heavy metals, and radionucleides √ Kills bacteria	Does not remove some volatile organic contaminants, certain pesti-cides and volatile solvents Bacteria may recolonize on the cool-ing coils during inactive periods

Activated carbon filters adsorb **organic contaminants** that cause taste and odor problems. Depending on their design, some units can remove chlorination byproducts, some cleaning solvents, and pesticides. To maintain the effectiveness of these units, the carbon canisters must be replaced periodically. Activated carbon filters are efficient in removing metals such as lead and copper if they are designed to absorb or remove lead.

Because ion exchange units can be used to remove minerals from your water, particularly calcium and magnesium, they are sold for water softening. Some ion exchange softening units remove radium and barium from water. Ion exchange systems that employ activated alumina are used to remove fluoride and arsenate from water. These units must be regenerated periodically with salt.

Reverse osmosis treatment units generally remove a more diverse list of contaminants than other systems. They can remove nitrates, sodium, other dissolved inorganics, and organic compounds.

Distillation units boil water and condense the resulting steam to create distilled water. Depending on their design, some of these units may allow vaporized organic contaminants to condense back into the product water, thus minimizing the removal of organics.

You may choose to boil your water to remove microbial contaminants. Keep in mind that boiling reduces the volume of water by about 20 percent, thus concentrating those contaminants not affected by the temperature of boiling water, such as nitrates and pesticides. For more information on boiling water, see page 5 of this booklet.

No one unit can remove everything. Have your water tested by a certified laboratory prior to purchasing any device. Do not rely on the tests conducted by salespeople that want to sell you their product.

Maintaining Treatment Devices

All POU and POE treatment units need maintenance to operate effectively. If they are not maintained properly, contaminants may accumulate in the units and actually make your water worse. In addition, some vendors may make claims about their effectiveness that have no merit. Units are tested for their safety and effectiveness by two organizations, NSF International and Underwriters Laboratory. In addition, the Water Quality Association represents the household, commercial, industrial and small community treatment industry and can help you locate a professional that meets their code of ethics. EPA does not test or certify these treatment units.

Where Can I Learn More About Home Treatment Systems?

Your local library has articles, such as those found in consumer magazines, on the effectiveness of these devices.

The U.S. General Accounting Office published a booklet called *Drinking Water: Inadequate Regulation of Home Treatment Units Leaves Consumers At Risk* (December 1991). To read this booklet, visit *www.gao.gov* and search for **document number RCED-92-34**, or call (202) 512-6000.

This treatment device is for point of use (POU). For more information on different types of devices contact NSF International, Underwriters Laboratory, or the Water Quality Association See Appendix C for contact information.

7. How Safe Is The Drinking Water In My Household Well?

EPA regulates public water systems; it does not have the authority to regulate private wells. Approximately 15 percent of Americans rely on their own private drinking water supplies (*Drinking Water from Household Wells,* 2002), and these supplies are not subject to EPA standards. Unlike public drinking water systems serving many people, they do not have experts regularly checking the water's source and its quality before it is sent to the tap. These households must take special precautions to ensure the protection and maintenance of their drinking water supplies.

Drinking Water from Household Wells is an EPA publication available to specifically address special concerns of a private drinking water supply. To learn more, or to obtain a copy, visit *www.epa.gov/safewater/privatewells,* or call the Safe Drinking Water Hotline.

How Much Risk Can I Expect?

The risk of having problems depends on how good your well is—how well it was built and located, and how well you maintain it. It also depends on your local environment. That includes the quality of the aquifer from which your water is drawn and the human activities going on in your area that can affect your well.

Several sources of pollution are easy to spot by sight, taste, or smell. However, many serious problems can be found only by testing your water. Knowing the possible threats in your area will help you decide the kind of tests you may need.

What Should I Do?

There are six basic steps you can take to help protect your private drinking water supply:

1. Identify potential problem sources.
2. Talk with local experts.
3. Have your water tested periodically.
4. Have the test results interpreted and explained clearly.
5. Set and follow a regular maintenance schedule for your well, and keep up-to-date records.
6. Immediately remedy any problems.

Identify Potential Problem Sources

Understanding and spotting possible pollution sources is the first step to safeguarding your drinking water. If your drinking water comes from a well, you may also have a **septic system**. Septic systems and other on-site wastewater disposal systems are major potential sources of contamination of private water supplies if they are poorly maintained or located improperly, or if they are used for disposal of toxic chemicals. Information on septic systems is available from local health departments, state agencies, and the National Small Flows Clearinghouse *(www.epa.gov/owm/mab/smcomm/nsfc.htm*) at (800) 624-8301. A septic system design manual and guidance on system maintenance are available from EPA (*www.epa.gov/OW-OWM.html/mtb/decent/homeowner.htm*).

Talk With Local Experts

Ground water conditions vary greatly from place to place, and local experts can give you the best information about your drinking water supply. Some examples are your health department's "sanitarian," local water-well contractors, public water system officials, county extension agents of the Natural Resources Conservation Service (NRCS), local or county planning commissions, and your local library.

Have Your Water Tested Periodically

Test your water every year for total **coliform** bacteria, nitrates, total dissolved solids, and pH levels. If you suspect other contaminants, test for these as well. As the tests can be expensive, limit them to possible problems specific to your situation. Local experts can help you identify these contaminants. You should also test your water after replacing or repairing any part of the system, or if you notice any change in your water's look, taste, or smell.

Often, county health departments perform tests for bacteria and nitrates. For other substances, health departments, environmental offices, or county governments should have a list of state-certified laboratories. Your State Laboratory Certification Officer can also provide you with this list. Call the Safe Drinking Water Hotline for the name and number of your state's certification officer. Any laboratory you use should be certified to do drinking water testing.

Have Your Test Results Interpreted And Explained Clearly

Compare your well's test results to federal and state drinking water standards (see Appendix A, or visit *www.epa.gov/safewater/mcl.html* or call the Safe Drinking Water Hotline). You may need to consult experts to aid you in understanding your results, such as the state agency that licenses water well contractors, your local health department, or your state's drinking water program.

Protecting Your Ground Water Supply

- Periodically inspect exposed parts of the well for problems such as:
  - Cracked, corroded, or damaged well casing
  - Broken or missing well cap
  - Settling and cracking of surface seals.
- Slope the area around the well to drain surface runoff away from the well.
- Install a well cap or sanitary seal to prevent unauthorized use of, or entry into, the well.
- Disinfect drinking water wells at least once per year with bleach or hypochlorite granules, according to the manufacturer's directions.
- Have the well tested once a year for coliform bacteria, nitrates, and other constituents of concern.
- Keep accurate records of any well maintenance, such as disinfection or sediment removal, that may require the use of chemicals in the well.
- Hire a certified well driller for any new well construction, modification, or abandonment and closure.
- Avoid mixing or using pesticides, fertilizers, herbicides, degreasers, fuels, and other pollutants near the well.
- Do not dispose of wastes in dry wells or in abandoned wells.
- Do not cut off the well casing below the land surface.
- Pump and inspect septic systems as often as recommended by your local health department.
- Never dispose of hazardous materials in a septic system.

Set A Regular Maintenance Schedule For Your Well And Your Septic System

Proper well and septic system construction and continued maintenance are keys to the safety of your water supply. Your state water well and septic system contractor licensing agency, local health department, or local public water system professional can provide information on well construction. Make certain your contractors are licensed by the state, if required, or certified by the National Ground Water Association.

Maintain your well, fixing problems before they reach crisis levels, and keep up-to-date records of well installation and repairs, as well as plumbing and water costs. Protect your own well area from contamination.

Immediately Remedy Any Problems

If you find that your well water is contaminated, fix the problem as soon as possible. Consider connecting into a nearby community water system, if one is available. You may want to install a water treatment device to remove impurities. Information on these devices is provided on page 16. If you connect to a public water system, remember to close your well properly.

Animal waste can contaminate your water supply

After A Flood-Concerns And Advisories

- Stay away from well pump to avoid electric shock.
- Do not drink or wash from a flooded well.
- Pump the well until water runs clear.
- If water does not run clear, contact the county or state health department or extension service for advice.

8. What You Can Do To Protect Your Drinking Water

Drinking water protection is a shared responsibility. Many actions are underway to protect our nation's drinking water, and there are many opportunities for citizens to become involved.

Be Involved!

EPA activities to protect drinking water include setting drinking water standards and overseeing the work of states that enforce federal standards—or stricter ones set by the individual state. EPA holds many public meetings on issues ranging from proposed drinking water standards to the development of databases. You can also comment on proposed drafts of other upcoming EPA documents. A list of public meetings and regulations open for comment can be found at *www.epa.gov/safewater/pubinput/html.*

Be Informed!

- Read the annual Consumer Confidence Report provided by your water supplier. Some Consumer Confidence Reports are available at *www.epa.gov/safewater/dwinfo.htm*.
- Use information from your state's Source Water Assessment to learn about potential threats to your water source.
- If you are one of the 15 percent of Americans who uses a private source of drinking water—such as a well, cistern, or spring—find out what activities are taking place in your **watershed** that may impact your drinking water; talk to local experts/test your water periodically; and maintain your well properly.
- Find out if the Clean Water Act standards for your drinking water source are intended to protect water for drinking, in addition to fishing and swimming.

Be Observant!

- Look around your watershed and look for announcements in the local media about activities that may pollute your drinking water.
- **Form and operate** a citizens watch network within your community to communicate regularly with law enforcement, your public water supplier and wastewater operator. **Communication** is key to a safer community!
- **Be alert**. Get to know your water/wastewater utilities, their vehicles, routines and their personnel.
- **Become aware of your surroundings**. This will help you to recognize suspicious activity as opposed to normal daily activities.

Other Ways To Get Involved

- Attend public hearings on new construction, storm water permitting, and town planning.
- Keep your public officials accountable by asking to see their environmental impact statements.
- Ask questions about any issue that may affect your water source.
- Participate with your government and your water system as they make funding decisions.
- Volunteer or help recruit volunteers to participate in your community's contaminant monitoring activities.
- Help ensure that local utilities that protect your water have adequate resources to do their job.

- If you see any suspicious activities in or around your water supply, please notify local authorities or call 9-1-1 immediately to report the incident.

Stormwater runoff threatens our sources of drinking water. As this water washes over roofs, pavement, farms and grassy areas, it picks up fertilizers, pesticides and litter, and deposits them in surface water and ground water. Here are some other threats to our drinking water:

Every year:

- We apply 67 million pounds of pesticides that contain toxic and harmful chemicals to our lawns.
- We produce more than 230 million tons of municipal solid water—approximately five pounds of trash or garbage per person per day—that contain bacteria, nitrates, viruses, synthetic detergents, and household chemicals.
- Our more than 12 million recreational and houseboats and 10,000 boat marinas release solvents, gasoline, detergents, and raw sewage directly into our rivers, lakes and streams.

Don’t Contaminate!

- Reduce paved areas: use permeable surfaces that allow rain to soak through, not run off.
- Reduce or eliminate pesticide application: test your soil before applying chemicals, and use plants that require little or no water, pesticides, or fertilizers.
- Reduce the amount of trash you create: reuse and recycle.
- Recycle used oil: 1 quart of oil can contaminate 2 million gallons of drinking water—take your used oil and antifreeze to a service station or recycling center.
- Take the bus instead of your car one day a week: you could prevent 33 pounds of carbon dioxide emissions each day.
- Keep pollutants away from boat marinas and waterways: keep boat motors well-tuned to prevent leaks, select nontoxic cleaning products and use a drop cloth, and clean and maintain boats away from the water.

For more information on how you can help protect your local drinking water source, call the Safe Drinking Water Hotline, or check *www.epa.gov/safewater/publicoutreach*. Additional resources are listed in Appendix C.

National Primary Drinking Water Regulations

Contaminant		MCL or TT[1] (mg/L)[2]	Potential health effects from long-term[3] exposure above the MCL	Common sources of contaminant in drinking water	Public Health Goal (mg/L)[2]
OC	Acrylamide	TT[4]	Nervous system or blood problems; increased risk of cancer	Added to water during sewage/ wastewater treatment	zero
OC	Alachlor	0.002	Eye, liver, kidney or spleen problems; anemia; increased risk of cancer	Runoff from herbicide used on row crops	zero
R	Alpha/photon emitters	15 picocuries per Liter (pCi/L)	Increased risk of cancer	Erosion of natural deposits of certain minerals that are radioactive and may emit a form of radiation known as alpha radiation	zero
IOC	Antimony	0.006	Increase in blood cholesterol; decrease in blood sugar	Discharge from petroleum refineries; fire retardants; ceramics; electronics; solder	0.006
IOC	Arsenic	0.010	Skin damage or problems with circulatory systems, and may have increased risk of getting cancer	Erosion of natural deposits; runoff from orchards; runoff from glass & electronics production wastes	0
IOC	Asbestos (fibers >10 micrometers)	7 million fibers per Liter (MFL)	Increased risk of developing benign intestinal polyps	Decay of asbestos cement in water mains; erosion of natural deposits	7 MFL
OC	Atrazine	0.003	Cardiovascular system or reproductive problems	Runoff from herbicide used on row crops	0.003
IOC	Barium	2	Increase in blood pressure	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits	2
OC	Benzene	0.005	Anemia; decrease in blood platelets; increased risk of cancer	Discharge from factories; leaching from gas storage tanks and landfills	zero
OC	Benzo(a)pyrene (PAHs)	0.0002	Reproductive difficulties; increased risk of cancer	Leaching from linings of water storage tanks and distribution lines	zero
IOC	Beryllium	0.004	Intestinal lesions	Discharge from metal refineries and coal-burning factories; discharge from electrical, aerospace, and defense industries	0.004
R	Beta photon emitters	4 millirems per year	Increased risk of cancer	Decay of natural and man-made deposits of certain minerals that are radioactive and may emit forms of radiation known as photons and beta radiation	zero
DBP	Bromate	0.010	Increased risk of cancer	Byproduct of drinking water disinfection	zero
IOC	Cadmium	0.005	Kidney damage	Corrosion of galvanized pipes; erosion of natural deposits; discharge from metal refineries; runoff from waste batteries and paints	0.005
OC	Carbofuran	0.04	Problems with blood, nervous system, or reproductive system	Leaching of soil fumigant used on rice and alfalfa	0.04
OC	Carbon tetrachloride	0.005	Liver problems; increased risk of cancer	Discharge from chemical plants and other industrial activities	zero
D	Chloramines (as Cl_2)	MRDL=4.0[1]	Eye/nose irritation; stomach discomfort; anemia	Water additive used to control microbes	MRDLG=4[1]
OC	Chlordane	0.002	Liver or nervous system problems; increased risk of cancer	Residue of banned termiticide	zero
D	Chlorine (as Cl_2)	MRDL=4.0[1]	Eye/nose irritation; stomach discomfort	Water additive used to control microbes	MRDLG=4[1]
D	Chlorine dioxide (as ClO_2)	MRDL=0.8[1]	Anemia; infants, young children, and fetuses of pregnant women: nervous system effects	Water additive used to control microbes	MRDLG=0.8[1]
DBP	Chlorite	1.0	Anemia; infants, young children, and fetuses of pregnant women: nervous system effects	Byproduct of drinking water disinfection	0.8
OC	Chlorobenzene	0.1	Liver or kidney problems	Discharge from chemical and agricultural chemical factories	0.1
IOC	Chromium (total)	0.1	Allergic dermatitis	Discharge from steel and pulp mills; erosion of natural deposits	0.1
IOC	Copper	TT[5]; Action Level = 1.3	Short-term exposure: Gastrointestinal distress. Long-term exposure: Liver or kidney damage. People with Wilson's Disease should consult their personal doctor if the amount of copper in their water exceeds the action level	Corrosion of household plumbing systems; erosion of natural deposits	1.3
M	*Cryptosporidium*	TT[7]	Short-term exposure: Gastrointestinal illness (e.g., diarrhea, vomiting, cramps)	Human and animal fecal waste	zero

LEGEND

D	Disinfectant	IOC	Inorganic Chemical	OC	Organic Chemical

OC	Epichlorohydrin	TT[4]	Increased cancer risk; stomach problems	Discharge from industrial chemical factories; an impurity of some water treatment chemicals	zero
OC	Ethylbenzene	0.7	Liver or kidney problems	Discharge from petroleum refineries	0.7
OC	Ethylene dibromide	0.00005	Problems with liver, stomach, reproductive system, or kidneys; increased risk of cancer	Discharge from petroleum refineries	zero
M	Fecal coliform and *E. coli*	MCL[6]	Fecal coliforms and *E. coli* are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Microbes in these wastes may cause short term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a special health risk for infants, young children, and people with severely compromised immune systems.	Human and animal fecal waste	zero[6]
IOC	Fluoride	4.0	Bone disease (pain and tenderness of the bones); children may get mottled teeth	Water additive which promotes strong teeth; erosion of natural deposits; discharge from fertilizer and aluminum factories	4.0
M	*Giardia lamblia*	TT[7]	Short-term exposure: Gastrointestinal illness (e.g., diarrhea, vomiting, cramps)	Human and animal fecal waste	zero
OC	Glyphosate	0.7	Kidney problems; reproductive difficulties	Runoff from herbicide use	0.7
DBP	Haloacetic acids (HAA5)	0.060	Increased risk of cancer	Byproduct of drinking water disinfection	n/a[9]
OC	Heptachlor	0.0004	Liver damage; increased risk of cancer	Residue of banned termiticide	zero
OC	Heptachlor epoxide	0.0002	Liver damage; increased risk of cancer	Breakdown of heptachlor	zero
M	Heterotrophic plate count (HPC)	TT[7]	HPC has no health effects; it is an analytic method used to measure the variety of bacteria that are common in water. The lower the concentration of bacteria in drinking water, the better maintained the water system is.	HPC measures a range of bacteria that are naturally present in the environment	n/a

LEGEND

D Disinfectant	IOC Inorganic Chemical	OC Organic Chemical
DBP Disinfection Byproduct	M Microorganism	R Radionuclides

	Contaminant	MCL or TT[1] (mg/L)[2]	Potential health effects from long-term[3] exposure above the MCL	Common sources of contaminant in drinking water	Public Health Goal (mg/L)[2]
OC	Hexachlorobenzene	0.001	Liver or kidney problems; reproductive difficulties; increased risk of cancer	Discharge from metal refineries and agricultural chemical factories	zero
OC	Hexachlorocyclopentadiene	0.05	Kidney or stomach problems	Discharge from chemical factories	0.05
IOC	Lead	TT5; Action Level=0.015	Infants and children: Delays in physical or or mental development; children could show slight deficits in attention span and learning abilities; Adults: Kidney problems; high blood pressure	Corrosion of household plumbing systems; erosion of natural deposits	zero
M	*Legionella*	TT7	Legionnaire's Disease, a type of pneumonia	Found naturally in water; multiplies in heating systems	zero
OC	Lindane	0.0002	Liver or kidney problems	Runoff/leaching from insecticide used on cattle, lumber, gardens	0.0002
IOC	Mercury (inorganic)	0.002	Kidney damage	Erosion of natural deposits; discharge from refineries and factories; runoff from landfills and croplands	0.002
OC	Methoxychlor	0.04	Reproductive difficulties	Runoff/leaching from insecticide used on fruits, vegetables, alfalfa, livestock	0.04
IOC	Nitrate (measured as Nitrogen)	10	Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits	10
IOC	Nitrite (measured as Nitrogen)	1	Infants below the age of six months who drink water containing nitrite in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits	1
OC	Oxamyl (Vydate)	0.2	Slight nervous system effects	Runoff/leaching from insecticide used on apples, potatoes, and tomatoes	0.2
OC	Pentachlorophenol	0.001	Liver or kidney problems; increased cancer risk	Discharge from wood-preserving factories	zero
OC	Picloram	0.5	Liver problems	Herbicide runoff	0.5
OC	Polychlorinated biphenyls (PCBs)	0.0005	Skin changes; thymus gland problems; immune deficiencies; reproductive or nervous system difficulties; increased risk of cancer	Runoff from landfills; discharge of waste chemicals	zero
R	Radium 226 and Radium 228 (combined)	5 pCi/L	Increased risk of cancer	Erosion of natural deposits	zero
IOC	Selenium	0.05	Hair or fingernail loss; numbness in fingers or toes; circulatory problems	Discharge from petroleum and metal refineries; erosion of natural deposits; discharge from mines	0.05
OC	Simazine	0.004	Problems with blood	Herbicide runoff	0.004
OC	Styrene	0.1	Liver, kidney, or circulatory system problems	Discharge from rubber and plastic factories; leaching from landfills	0.1
OC	Tetrachloroethylene	0.005	Liver problems; increased risk of cancer	Discharge from factories and dry cleaners	zero
IOC	Thallium	0.002	Hair loss; changes in blood; kidney, intestine, or liver problems	Leaching from ore-processing sites; discharge from electronics, glass, and drug factories	0.0005
OC	Toluene	1	Nervous system, kidney, or liver problems	Discharge from petroleum factories	1
M	Total Coliforms	5.0 percent[8]	Coliforms are bacteria that indicate that other, potentially harmful bacteria may be present. See fecal coliforms and *E. coli*	Naturally present in the environment	zero
DBP	Total Trihalomethanes (TTHMs)	0.080	Liver, kidney or central nervous system problems; increased risk of cancer	Byproduct of drinking water disinfection	n/a[9]
OC	Toxaphene	0.003	Kidney, liver, or thyroid problems; increased risk of cancer	Runoff/leaching from insecticide used on cotton and cattle	zero
OC	2,4,5-TP (Silvex)	0.05	Liver problems	Residue of banned herbicide	0.05
OC	1,2,4-Trichlorobenzene	0.07	Changes in adrenal glands	Discharge from textile finishing factories	0.07
OC	1,1,1-Trichloroethane	0.2	Liver, nervous system, or circulatory problems	Discharge from metal degreasing sites and other factories	0.2
OC	1,1,2-Trichloroethane	0.005	Liver, kidney, or immune system problems	Discharge from industrial chemical factories	0.003
OC	Trichloroethylene	0.005	Liver problems; increased risk of cancer	Discharge from metal degreasing sites and other factories	zero

NOTES

1 Definitions

- Maximum Contaminant Level Goal (MCLG)—The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.
- Maximum Contaminant Level (MCL)—The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.
- Maximum Residual Disinfectant Level Goal (MRDLG)—The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
- Maximum Residual Disinfectant Level (MRDL)—The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- Treatment Technique (TT)—A required process intended to reduce the level of a contaminant in drinking water.

2 Units are in milligrams per liter (mg/L) unless otherwise noted. Milligrams per liter are equivalent to parts per million (ppm).

3 Health effects are from long-term exposure unless specified as short-term exposure.

4 Each water system must certify annually, in writing, to the state (using third-party or manufacturers certification) that when it uses acrylamide and/or epichlorohydrin to treat water, the combination (or product) of dose and monomer level does not exceed the levels specified, as follows: Acrylamide = 0.05 percent dosed at 1 mg/L (or equivalent); Epichlorohydrin = 0.01 percent dosed at 20 mg/L (or equivalent).

5 Lead and copper are regulated by a Treatment Technique that requires systems to control the corrosiveness of their water. If more than 10 percent of tap water samples exceed the action level, water systems must take additional steps. For copper, the action level is 1.3 mg/L, and for lead is 0.015 mg/L.

6 A routine sample that is fecal coliform-positive or *E. coli*-positive triggers repeat samples--if any repeat sample is total coliform-positive, the system has an acute MCL violation. A routine sample that is total coliform-positive and fecal coliform-negative or *E. coli*-negative triggers repeat samples--if any repeat sample is fecal coliform-positive or *E. coli*-positive, the system has an acute MCL violation. See also Total Coliforms.

7 EPA's surface water treatment rules require systems using surface water or ground water under the direct influence of surface water to (1) disinfect their water, and (2) filter their water or meet criteria for avoiding filtration so that the following contaminants are controlled at the following levels:

- *Cryptosporidium*: 99 percent removal for systems that filter. Unfiltered systems are required to include Cryptosporidium in their existing watershed control provisions.
- Giardia lamblia: 99.9 percent removal/inactivation
- Viruses: 99.99 percent removal/inactivation
- *Legionella*: No limit, but EPA believes that if *Giardia* and viruses are removed/inactivated according to the treatment techniques in the surface water treatment rule, *Legionella* will also be controlled.
- Turbidity: For systems that use conventional or direct filtration, at no time can turbidity (cloudiness of water) go higher than 1 nephelolometric turbidity unit (NTU), and samples for turbidity must be less than or equal to 0.3 NTU in at least 95 percent of the samples in any month. Systems that use filtration other than conventional or direct filtration must follow state limits, which must include turbidity at no time exceeding 5 NTU.
- HPC: No more than 500 bacterial colonies per milliliter
- Long Term 1 Enhanced Surface Water Treatment; Surface water systems or ground water systems under the direct influence of surface water serving fewer than 10,000 people must comply with the applicable Long Term 1 Enhanced Surface Water Treatment Rule provisions (e.g. turbidity standards, individual filter monitoring, *Cryptosporidium* removal requirements, updated watershed control requirements for unfiltered systems).
- Long Term 2 Enhanced Surface Water Treatment; This rule applies to all surface water systems or ground water systems under the direct influence of surface water. The rule targets additional *Cryptosporidium* treatment requirements for higher risk systems and includes provisions to reduce risks from uncovered finished water storages facilities and to ensure that the systems maintain microbial protection as they take steps to reduce the formation of disinfection byproducts. (Monitoring start dates are staggered by system size. The largest systems (serving at least 100,000 people) will begin monitoring in October 2006 and the smallest systems (serving fewer than 10,000 people) will not begin monitoring until October 2008. After completing monitoring and determining their treatment bin, systems generally have three years to comply with any additional treatment requirements.)
- Filter Backwash Recycling: The Filter Backwash Recycling Rule requires systems that recycle to return specific recycle flows through all processes of the system's existing conventional or direct filtration system or at an alternate location approved by the state.

8 No more than 5.0 percent samples total coliform-positive in a month. (For water systems that collect fewer than 40 routine samples per month, no more than one sample can be total coliform-positive per month.) Every sample that has total coliform must be analyzed for either fecal coliforms or *E. coli*. If two consecutive TC-positive samples, and one is also positive for *E. coli* or fecal coliforms, system has an acute MCL violation.

9 Although there is no collective MCLG for this contaminant group, there are individual MCLGs for some of the individual contaminants:

- Haloacetic acids: dichloroacetic acid (zero); trichloroacetic acid (0.3 mg/L)
- Trihalomethanes: bromodichloromethane (zero); bromoform (zero); dibromochloromethane (0.06 mg/L)

Appendix D: Glossary

Action Level

The level of lead and copper which, if exceeded, triggers treatment or other requirements that a water system must follow.

Aquifer

A natural underground layer, often of sand or gravel, that contains water

Coliform

A group of related bacteria whose presence in drinking water may indicate contamination by disease-causing microorganisms

Community Water System (CWS)

A water system that supplies drinking water to 25 people or more year-round in their residences

Contaminant

Anything found in water (including microorganisms, radionuclides, chemicals, minerals, etc.) which may be harmful to human health

Cryptosporidium

Microorganism found commonly in lakes and rivers which is highly resistant to disinfection.

Disinfectant

A chemical (commonly chlorine, chloramines, or ozone) or physical process (e.g., ultraviolet light) that kills microorganisms such as viruses, bacteria, and protozoa

Distribution System

A network of pipes leading from a treatment plant to customers' plumbing systems

Ground Water

Water that is pumped and treated from an aquifer

Inorganic Contaminants

Mineral-based compounds such as metals, nitrates, and asbestos; naturally occurring in some water, but can also enter water through human activities

Maximum Contaminant Level

The highest level of a contaminant that EPA allows in drinking water (legally enforceable standard)

Maximum Contaminant Level Goal

The level of a contaminant at which there would be no risk to human health (not a legally enforceable standard)

Microorganisms

Tiny living organisms that can be seen only under a microscope; some can cause acute health problems when consumed in drinking water

Non-Transient Non-Community Water System

A non-community water system that serves the same people more than six months of the year, but not year-round

Organic Contaminants

Carbon-based chemicals, such as solvents and pesticides, which enter water through cropland runoff or discharge from factories

Pathogen

Disease-causing organism

Public Water System (PWS)

A water system which supplies drinking water to at least 25 people, at least 60 days each year

Sensitive Subpopulation

People who may be more vulnerable to drinking water contamination, such as infants, children, some elderly, and people with severely compromised immune systems

Septic System

Used to treat sanitary waste; can be a significant threat to water quality due to leaks or runoff

Source Water

Water in its natural state, prior to any treatment for drinking (i.e., lakes, streams, ground water)

Surface Water

Water that is pumped and treated from sources open to the atmosphere, such as rivers, lakes, and reservoirs

Transient Non-Community Water System

A non-community water system that serves the public but not the same individuals for more than six months

Violation

Failure to meet any state or federal drinking water regulation

Vulnerability Assessment

An evaluation of drinking water source quality and its vulnerability to contamination by pathogens and toxic chemicals

Watershed

The land area from which water drains into a stream, river, or reservoir

Well

A bored, drilled or driven shaft whose depth is greater than the largest surface dimension, a dug hole whose depth is greater than the largest surface dimension, an improved sinkhole, or a subsurface fluid distribution system

Definitions

activity-based air sampling: Collecting air samples while engaging in dust generation activities (e.g., those that could disturb asbestos fibers and release them into the air).

ambient air: Generally, the surrounding air present throughout a vicinity. For the El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, ambient air is specifically defined as outdoor air (as opposed to indoor air) collected from the general vicinity of the various subject sites, and which may be used for reference samples. These samples may variably be upwind, downwind, or crosswind from locations that activity-based sampling scenarios are conducted, and they may or may not be influenced by sampling activities. In addition, some of the ambient air samples were collected under normal conditions (i.e., while no activity-based sampling was conducted).

amphibole: One of the two groups of minerals (serpentine and amphibole) that can crystallize as asbestos. The regulated asbestiform minerals of this group are crocidolite, amosite, anthophyllite asbestos, tremolite asbestos, and actinolite asbestos.

analytical sensitivity: The sample-specific lowest concentration of asbestos the laboratory can reliably detect.

asbestos: Asbestos is the generic name used for a group of naturally occurring mineral silicate fibers of the serpentine and amphibole series. Asbestos is composed of fiber bundles that are made up of extremely long and thin fibers that are easily separated from one another. For the purposes of this project, asbestos encompasses not only the six regulated varieties, but also the non-regulated asbestiform minerals.

asbestiform: Fibrous or tending to break into fibers.

aspect ratio: Length to width ratio.

Definitions (Cont.)

breathing height: A height representing a typical height of a person's nose/mouth area.

chrysotile: A regulated mineral in the serpentine group of minerals that can crystallize as asbestos. Chrysotile is also known as serpentine asbestos.

fixed sample pump: An air sample pump whose position is constant throughout the entire duration of the sampling effort. A fixed sample pump remains in its fixed location on a long-term basis over a period longer than 1 day. Typically a high-flow sample pump is used where a fixed sample pump is needed.

high-flow sample pump: Also known as a high-volume sample pump, this is an air sample pump that is capable of drawing up to about 30 liters per minute of air. This type of sample pump is not generally portable and is typically used for sampling from fixed and stationary positions.

hi-vol: Shorthand for high-volume or high-flow (sample pump).

infield skin: The non-grass infield area of a baseball or softball field; also commonly referred to as infield "dirt" or "base pad."

levels of personal protection: When sampling is conducted where contamination may exist, personal protective equipment (PPE) must be worn to prevent or reduce skin and eye contact, inhalation, and ingestion of the substance. Protective equipment to protect the body against contact with known or anticipated chemical hazards has been divided into four categories known as Levels A, B, C, and D:

- **Level D** is primarily a work uniform and is used for nuisance contamination only. Level D generally includes basic work clothing with steel-toed and steel-shanked boots, and may include coveralls, a hard hat, gloves, ear plugs, and safety goggles.
- **Level C** protection is worn when the type of airborne substance is known, concentration measured, criteria for using air-purifying respirators (APR) met, and skin and eye exposure is unlikely. Level C generally includes everything used for Level D, with the addition of an APR or powered APR for inhalation protection.
- **Level B** protection is worn when the highest level of respiratory protection is needed, but a lesser level of skin and eye protection. Level B also generally includes everything

Definitions (Cont.)

used for Level D; and in addition includes appropriate chemical-resistant coveralls and gloves for dermal protection, and a full-faced mask and self-contained breathing apparatus (SCBA) or supplied air for eye protection and complete respiratory protection.

- **Level A** protection is worn when the highest level of respiratory, skin, eye and mucous membrane protection is needed. Level A protection includes a fully encapsulated suit for total skin, eye and mucous membrane protection and an SCBA for complete respiratory protection.

naturally occurring asbestos: Asbestos minerals that occur in rock and soil as the result of natural geologic processes, often in veins near earthquake faults in the coast ranges and the foothills of the Sierra Nevada mountains and other areas of California.

personal sample pump: Also known as a low-flow or low-volume sample pump, this is an air sample pump that is portable so that it can be worn by a member of the sampling team during activity-based sample collection. The air flow for a personal sample pump is typically 1 to 5 liters per minute.

phase contrast microscopy (PCM): A light-enhancing microscope technology that employs an optical mechanism to translate small variations in phase into corresponding changes in amplitude, resulting in high-contrast images. This method was used traditionally to measure airborne fibers in occupational environments; however, it cannot distinguish between asbestos fibers and other fibers.

phase contrast microscopy equivalent (PCME): This refers to asbestiform structures identified through transmission electron microscopy (TEM) analysis that are equivalent to those that would be identified in the same sample through phase contrast microscopy analysis, with the main difference being that TEM additionally permits the specific identification of asbestos fibers. PCME structures are asbestiform structures greater than 5 microns in length having at least a 3 to 1 length to width (aspect) ratio.

polarized light microscopy (PLM): A microscope technology that uses the polarity (or orientation) of light waves to provide better images than a standard optical microscope.

Definitions (Cont.)

reference sample: An ambient air sample from outside the specific area of concern collected concurrently with the activity-based samples; it is used as a reference for comparison with the activity-based air samples.

stationary sample pump: An air sample pump that is placed in a single location and is not moved during a sampling event. A stationary sample pump remains in its stationary location during one or more sample events. Typically a high-flow sample pump will be used where a stationary sample pump is needed.

transmission electron microscopy (TEM): A microscope technology that uses the properties of electrons to provide more detailed images than even polarized light microscopy.

ultramafic rock: An igneous rock containing mainly dark, ferromagnesian minerals (i.e., greater than 90% of olivine, pyroxene, or hornblende). Commercial deposits of asbestos have been associated with ultramafic rocks.

National Priorities List

The **U.S. Environmental Protection Agency** (U.S. EPA), Region IX, under the authority of the **Comprehensive Environmental Response, Compensation, and Liability Act of 1980** (CERCLA) and the **Superfund Amendments and Reauthorization Act of 1986** (SARA), tasked the **Ecology and Environment, Inc.,** (E & E) **Superfund Technical Assessment and Response Team** (START) to conduct a multimedia assessment of community areas and schools in El Dorado Hills in El Dorado County, California, to assess the potential for exposure from naturally occurring asbestos present in soils that have been disturbed. This **preliminary assessment** and **site inspection** (PA/SI) report identifies the subject area, describes the data-gathering activities that have been conducted to date, and summarizes the results of those activities.

As part of the PA/SI, the site is evaluated using U.S. EPA's **Hazard Ranking System** (HRS) criteria. The HRS assesses the relative threat associated with actual or potential releases of hazardous substances to the environment and has been adopted by the U.S. EPA to assist in setting priorities for further evaluation and eventual remedial action. The HRS is the primary method for determining a site's eligibility for placement on the **National Priorities List** (NPL). The NPL identifies sites where the U.S. EPA may conduct remedial response actions.

2 Apparent Problem

ultramafic
A type of igneous rock containing mainly dark, ferromagnesian minerals

ambient air
The surrounding air present throughout a vicinity

DTSC
California Department of Toxic Substances Control

CARB
California Air Resources Board

Exposure risk from naturally occurring asbestos, particularly an exposure occurring as a result of construction activities, has been a concern in El Dorado County for some time. (See *Findings and Recommendations on Naturally-Occurring Asbestos to El Dorado County*, State of California Asbestos Task Force, March 11, 1999.) Naturally occurring asbestos is found in **ultramafic** rock formations in many locations in El Dorado County, California. In El Dorado Hills, the location of this assessment, asbestos is found in association with the West Bear Mountains Fault Zone, which runs north to south across El Dorado County.

In El Dorado Hills the presence of asbestos in exposed soil and **ambient air** has already been documented through previous investigations as well as visual inspection conducted by the U.S. EPA, the **California Department of Toxic Substances Control** (DTSC), the **California Air Resources Board** (CARB), and the El Dorado Union High School District. These previous investigations were conducted in a residential area on Woedee Drive and at Oak Ridge High School, located at 1120 Harvard Way. Mitigation activities to address asbestos contamination in disturbed soils on the campus of Oak Ridge High School have been conducted by El Dorado Union High School District, with oversight by El Dorado County and the state and by U.S. EPA.

PA
preliminary assessment

CERCLIS
Comprehensive Environmental Response, Compensation, and Liability Information System

In September 2003, a citizen petitioned U.S. EPA to conduct a **preliminary assessment** at the El Dorado Hills Community Park, Silva Valley Elementary School, Rolling Hills Middle School, and other locations in the community where the suspected presence of naturally occurring asbestos in exposed and disturbed soil may be causing releases to air. After review of the petition and discussions with the petitioner, the U.S. EPA defined the study area (called El Dorado Hills Naturally Occurring Asbestos) to include the El Dorado Hills Community Park, Silva Valley Elementary School, Rolling Hills Middle School, Jackson Elementary School, and the New York Creek Nature Trail. The U.S. EPA entered the El Dorado Hills Naturally Occurring Asbestos site into the **Comprehensive Environmental Response, Compensation, and Liability Information System** (CERCLIS) with U.S. EPA Identification Number CAN000906083 on April 7, 2004.

3 Site Description and History

3.1 SITE LOCATION

El Dorado Hills is approximately 20 miles east of Sacramento, California. The community is within an unincorporated area of El Dorado County that is commonly referred to as the Western County Region. With a current population of about 31,000, El Dorado Hills has become a "bedroom" community, with a growing number of residents commuting to work in Sacramento.

A number of areas throughout El Dorado Hills are the subject of the El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment. These areas, addressed in this PA/SI report and shown on Figure 3-1 (Sites Location Map), include the following:

- The El Dorado Hills Community Park, including several play areas and the New York Creek Nature Trail;
- Silva Valley Elementary School;
- Jackson Elementary School;
- Rolling Hills Middle School, including the dirt embankment inside the school's eastern boundary (Dirt Embankment); and
- An unpaved lot used for parking on public property adjacent to and in front of Rolling Hills Middle School (Dirt Parking Area).

Figure 3-1

3.2 SITE DESCRIPTION

El Dorado Hills Community Park and New York Creek Nature Trail. The El Dorado Hills Community Park at 1021 Harvard Way is situated on about 40 acres of property along El Dorado Hills Boulevard between Harvard Way and St. Andrews Drive (Latitude 38E 40' 59" North, Longitude 121E04' 28" West). The Community Park property, which is transected by New York Creek, contains three baseball diamonds, soccer playing fields, a children's playground, a swimming pool, community center structures, the southern end of the New York Creek Nature Trail, other picnic and recreational areas, and parking areas. The New York Creek Nature Trail is an unpaved trail adjacent to New York Creek. From Harvard Way, the trail runs north almost 2 miles through the Community Park property and residential neighborhoods to Art Weisberg Park, which is opposite Jackson Elementary School on Francisco Drive.

Silva Valley Elementary School. Silva Valley Elementary School is located at 3001 Golden Eagle Lane (Latitude 38E 40' 40" North, Longitude 121E04' 11" West). With about 650 students, it is a year-round K-5 elementary school in the Buckeye Union School District. Some of the school's facilities include six classroom buildings, a multipurpose room, an administration building, a library, a computer laboratory, a grass-covered playing field, a grass-infield baseball diamond, a "Life Lab" garden area, and play structures.

Jackson Elementary School. Jackson Elementary School is located at 2561 Francisco Drive (Latitude 38E 42' 14" North, Longitude 121E04' 51" West). With almost 500 students, it is a traditional K-5 elementary school in the Rescue Union School District. Some of the school's facilities include approximately 26 classrooms (all carpeted), an administration building, a library, a computer laboratory, a grass-covered playing field with grass-infield baseball diamonds, an outdoor classroom and garden, two paved play areas with basketball courts and tetherball, and play structures. The outdoor classroom and garden area is a place where students participate in gardening activities as part of the educational program.

Rolling Hills Middle School and the Dirt Embankment. Rolling Hills Middle School is located at 7141 Silva Valley Parkway (Latitude 38E 40' 54" North, Longitude 121E04' 07" West). Built in its current location in 1998, the school is a year-round middle school (6th to 8th grades) with about 800 students. The school is part of the Buckeye Union School District. Some of the school's facilities include classrooms, an administration building, a library, a grass-covered soccer field, and a paved basketball play area. The Dirt Embankment is a dirt embankment/hillside behind Rolling Hills Middle School and inside its eastern boundary.

The Dirt Parking Area. The Dirt Parking Area is an unpaved lot used for parking on public property in front of Rolling Hills Middle School, outside its western boundary. The property is said to be used regularly as a parking lot primarily by high school students who attend the nearby Oak Ridge High School.

3.3 SITE HISTORY

On May 21, 1962, the El Dorado County Board of Supervisors adopted Resolution #98-62 creating the **El Dorado Hills Community Services District** (CSD). The CSD is governed by a five-member elected Board of Directors and is the primary provider of parks and recreation services to residents of El Dorado Hills, in addition to a variety of other community services.

CSD
El Dorado Hills Community Services District

The population of El Dorado Hills has grown rapidly in the last two decades. For example, the population jumped 81 percent in ten years, from an estimated 12,105 people in 1991 to 21,917 people in 2001. According to the State Department of Finance, by August 2001 the population was 23,013, and in January 2005 the population was about 31,000. Prior to this expansive growth, much of the land in the community was undeveloped open space.

The El Dorado Hills Community Park is one of almost two dozen neighborhood and community parks provided by the El Dorado Hills CSD. The CSD main office is at the Community Park, and there are about 26 full-time and 8 part-time workers on staff there year-round.

The southern end of the New York Creek Nature Trail begins in the Community Park, and the northern end is in Art Weisberg Park near Jackson Elementary School. The trail, which is considered an educational opportunity for local schools, provides botanical settings and views of native wildlife within the approximately 28-acre New York Creek Nature Area.

El Dorado Hills CSD received part of the area that is now the New York Creek Nature Trail in 1972 as a gift deed. In 1986 the area was enlarged when an 11-acre parcel along New York Creek was conveyed to the CSD for use as an open space natural area. The New York Creek Stewardship Committee was formed to encourage local community involvement in the protection, conservation, care and use of New York Creek.

The Community Park grounds are maintained by both in-house and contracted maintenance workers who perform such duties as mowing lawns using a riding mower, grooming the baseball diamond infields using an electric maintenance cart (i.e., golf cart) and drag chains, and using a leaf blower to clear walkways and parking areas and to clean playground structures.

Silva Valley Elementary School and Rolling Hills Middle School are within the Buckeye Union School District. Built in 1992, Silva Valley Elementary School was once surrounded by empty fields, but new homes now flank the property. There are about 650 students currently enrolled at the year-round school, with about 29 teachers and 20 staff members, including maintenance staff. At Rolling Hills Middle School, which moved to its current permanent facilities in August 1998, there are about 800 students, 30 teachers, and 20 to 25 staff members, including maintenance staff. School district staff maintain the grounds at both schools, with the exception of mowing the playing fields, which is done by a contractor to the district.

The Dirt Parking Area, which sits adjacent to Rolling Hills Middle School, is apparently maintained by and under the jurisdiction of the El Dorado County Department of Transportation.

Jackson Elementary School, part of the Rescue Union School District, is a traditional elementary school. In the fall, there will be 22 teachers, about nine staff members, and about 470 students. The school grounds (along with the grounds of other schools in the district) are maintained by two district groundsmen; this number is expected to increase to three in June.

While Oak Ridge High School is not part of the El Dorado Hills Naturally Occurring Multimedia Assessment, it is centrally located between the majority of the locations that are included in the assessment, and it is in a geologically similar region. In February

2002, construction began of two soccer fields along the southwest border of Oak Ridge High School. During construction, veins of asbestos-bearing minerals were disturbed.

CoEMD
El Dorado County Environmental Management Department

The El Dorado Union High School District reportedly encountered difficulties in acquiring reclaimed irrigation water for the project, so the soccer fields were left without landscaping for more than a year while a solution was sought. Subsequent erosion of disturbed, potentially asbestos-bearing soils from the unfinished fields caused by winter rains in 2002/2003 impacted classrooms and locker rooms downslope. In addition, the El Dorado Union High School District, in coordination with the **El Dorado County Environmental Management Department** (CoEMD) and DTSC, identified other areas of concern on the campus. This led the school district to undertake mitigation activities at Oak Ridge High School in the summer of 2003. See Section 4, Regulatory Involvement, for a brief discussion of activities subsequent to this mitigation effort.

4 Regulatory Involvement

f/cc
fibers per cubic centimeter

The CARB has conducted air monitoring in several locations in California to determine levels of asbestos in air at selected sites. In April 1999, the CARB measured ambient asbestos concentrations in air at seven monitoring locations at and near Silva Valley Elementary School. Of the 20 samples collected at the school, four of the samples contained detectable levels of asbestos; the highest level detected (in two of the samples) was 0.0019 **fibers per cubic centimeter** (f/cc).

While there has been no other regulatory involvement to date related to the locations that are the subject of the El Dorado Hills Naturally Occurring Exposure Multimedia Assessment, the El Dorado Union High School District has been working with several agencies at the Federal, State and local levels to address the exposed asbestos at the nearby Oak Ridge High School. Mitigation actions undertaken by the school district are described in the *El Dorado Union High School District Oak Ridge High School Naturally Occurring Asbestos (NOA) Operations and Maintenance (O&M) Plan*, dated December 2003, prepared by MACTEC Federal Programs.

The CARB conducted air sampling in June and July 2003 to assess the type and quantity of asbestos fibers released to ambient air during mitigation activities at the soccer fields. The CARB sam-

s/cc
structures per cubic centimeter

pling documented the presence of asbestos in ambient air samples collected during mitigation activities, with a maximum asbestos level recorded in air of 0.0039 **structures per cubic centimeter** (s/cc) and an average concentration at the mitigation fence line of 0.001 s/cc. A complete description of the CARB sampling locations, methodology and findings is available in the November 6, 2003, CARB report *Sampling for Airborne Naturally Occurring Asbestos at Oak Ridge High School June 2003*.

Due to citizens' concerns about asbestos on the Oak Ridge High School campus, the U.S. EPA and START conducted an assessment of surficial soil at the high school in November 2003 to determine whether additional mitigation efforts were required in areas other than those related to the soccer fields. During the assessment exposed soils throughout the campus were sampled, particularly those areas where observed or expected student or public traffic could disturb asbestos-containing soil or rock. Sampling documented that asbestos was present in exposed soils throughout the campus ranging from less than 0.0001 to 8.8 percent by weight. U.S. EPA subsequently performed remediation at Oak Ridge High School by covering exposed soil with landscaping, concrete, or pavement.

activity-based air sampling
Collecting air samples while engaging in dust generation activities (e.g., those that could disturb asbestos fibers and release them into the air.)

personal air sampler
Also known as a low-flow or low-volume sample pump, this is an air sample pump that is portable so that it can be worn by a member of the sampling team during activity-based sample collection. The air flow for a personal sample pump is typically 1 to 5 liters per minute.

stationary air sampler
An air sample pump that is placed in a single location and is not moved during a sampling event. A stationary sample pump remains in its stationary location during one or more sample events. Typically a high-flow sample pump will be used where a stationary sample pump is needed.

fixed air sampler
An air sample pump whose position is constant throughout the entire duration of the sampling effort. A fixed sample pump remains in its fixed location on a long-term basis over a period longer than 1 day. Typically a high-flow sample pump is used where a fixed sample pump is needed.

ambient air
Generally, the surrounding air present throughout a vicinity.

reference sample
An ambient air sample from outside the specific area of concern collected concurrently with the activity-based samples; it is used as a reference for comparison with the activity-based air samples.

Summary of Investigative Efforts

5.1 OBJECTIVES

As part of the El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, the START collected outdoor air and soil samples to assist the U.S. EPA in identifying and estimating associated exposure levels for locations in El Dorado Hills where there is a potential for exposure to asbestos from disturbed areas of naturally occurring asbestos.

- The START collected **activity-based** outdoor air samples from the Community Park, the New York Creek Nature Trail, and three schools in El Dorado Hills. This was to document whether and at what concentrations asbestos fibers were present in outdoor air during activities conducted at sampled locations on the days of sampling. Activity-based outdoor air samples were collected under conditions ranging from minimal activity to dust generation activities while members of the sampling team wore **personal sample pumps**. In addition, **stationary air samplers** were set up in and around the activity areas during most of the activity-based sampling.
- The START also set up **fixed air samplers** at the Community Park and schools to collect **ambient** outdoor air samples collected from outside activity areas to serve as **reference** samples.

- The START collected surface soil samples at the Community Park, the Dirt Embankment, the Dirt Parking Area and the schools to document whether and at what concentrations asbestos fibers were present in soil at sampled locations. At the baseball playing fields at the Community Park, where the **infield skin** is imported material, the START also collected shallow subsurface soil samples from at and below the interface of the infield fill and the soil beneath (down to about 1½ to 2 feet below ground surface).

infield skin
The non-grass infield area of a baseball or softball field; also commonly referred to as infield "dirt" or "base pad"

QAPP
Quality Assurance Project Plan

FSP
Field Sampling Plan

DQO
Data Quality Objective

SOW
Statement of Work

5.2 SCOPE OF WORK

The U.S. EPA directed the START to develop a **Quality Assurance Project Plan** (QAPP) and **Field Sampling Plans** (FSPs), conduct ambient outdoor air sampling, activity-based outdoor air sampling, dust monitoring, soil sampling, meteorological data collection, video monitoring of fugitive dust present during outdoor air sampling, and limited video documentation of the soil sampling. The START assisted the U.S. EPA with the project objectives planning, including the development of data quality related objectives using the U.S. EPA's **Data Quality Objective** (DQO) planning process. The START developed the *El Dorado Hills Naturally Occurring Asbestos, Multimedia Exposure Assessment, El Dorado Hills, California, Quality Assurance Project Plan* based upon the DQO planning process and developed supporting FSP and analytical **Statement of Work** (SOW) documents.

The START conducted ambient and activity-based air sampling for asbestos fibers in outdoor air, real-time air monitoring to measure total dust, soil sampling for asbestos fibers, meteorological data collection, and video monitoring to document dust generation and sampling. For logistical reasons, the START did not conduct video monitoring of the soil sampling effort, but photographed many of the locations of soil samples collected for asbestos analysis. The START procured subcontractors as needed to aid in the collection of the air samples, preparation and analysis of samples, and validation of generated data. The U.S. EPA **Quality Assurance Office** (QAO) is over-seeing the data validation of the analytical results.

QAO
Quality Assurance Office

ERT
U.S. EPA's Environmental Response Team

The START is using the Scribe data management system to manage asbestos and meteorological data generated as part of the project. Scribe is a software tool developed by the U.S. EPA's **Environmental Response Team** (ERT) to assist in the process of managing environmental data.

5.3 SCHEDULE

Outdoor air sampling activities began in late September 2004. The START conducted ambient air reference sampling between September 27 and October 12, 2004. The activity-based air sampling took place between October 2 and October 10, 2004. The START collected soil samples for asbestos analysis between October 8 and October 11, 2004.

5.4 AIR SAMPLING

5.4.1 Ambient Outdoor Air Sampling

The START conducted ambient outdoor air sampling according to the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Fixed Ambient Outdoor Reference Air Sampling Field Sampling Plan* and the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Activity-Based Outdoor Air Sampling of Community Park and Schools Field Sampling Plan*.

The START collected fixed ambient outdoor reference air samples from locations that were selected so as to collect from areas nearby but primarily outside of the influence of activity-based outdoor air sampling activities. These fixed ambient outdoor reference air sampling locations were in the following areas:

- Five locations, referred to as the Southern Reference Area, at the El Dorado Hills Community Park, Silva Valley Elementary School, and Rolling Hills Middle School, and
- Five locations, referred to as the Northern Reference Area, around Jackson Elementary School.

In addition to these reference air sampling locations, the START placed one fixed ambient outdoor air sampler co-located with a temporary meteorological station positioned in a secure location west of the children's playground at the El Dorado Hills Community Park. This location is referred to as the Ambient Air Monitoring Station.

Finally, along the New York Creek Nature Trail, the START placed stationary air samplers to conduct ambient outdoor air monitoring on two days when there was public activity on the trail but no activity-based sampling conducted there.

Except for the Ambient Air Monitoring Station (which was enclosed by a cyclone fence), the air sample pumps used for ambient outdoor air sampling generally were in locations that had public access. To ensure the integrity of the samples, either a member of the sampling team or a security guard watched the air sample pumps while they were operating. The START also conducted regular checks throughout the day to make sure the pumps were operating and the power source was adequate and continuous.

5.4.1.1 Fixed Ambient Air Sampling at the Community Park

Beginning on September 27, several days prior to conducting activity-based outdoor air sampling, the START positioned and began operating a temporary meteorological station, a high-volume (i.e., high-flow, approximately 10 liters/minute) air sample pump, and a dust monitor within an existing small fenced area west of the children's playground at the El Dorado Hills Community Park. The location of this area is shown as the Ambient Air Meteorological Station (AAMS) on Figure 5-1 (Fixed Ambient Outdoor Air Sampling Locations). The START operated the meteorological station, the air sample pump, and the dust monitor at this location daily through October 12.

The meteorological station was set up as a base station for the project to monitor wind speed, wind direction, humidity, temperature, and other meteorological conditions. Due to equipment malfunction, the electronic set of data collected from the meteorological base station was lost for the period from October 5 through October 8, 2004; however the START did collect some of the meteorological data for this period through manual periodic logging. In addition, a second mobile meteorological station was used to collect meteorological data during some of the activity-based air sampling scenarios that were conducted during this period. The weather during the week leading up to the sampling was generally dry, and it was dry during most of the first week of sampling, but it drizzled on October 9, 2004. See Appendix A for a summary of meteorological data collected from the base station and from the mobile station.

The START collected air samples on air filters from the Ambient Air Meteorological Station fixed air sampler each day over an approximately 8-hour time interval. The daily time interval gener-

Figure 5-1

breathing height
A height representing a typical height of a person's nose/mouth area

ally coincided with activity-based scenario sampling time periods. The primary focus of the investigative efforts is the potential for exposure of asbestos to children, so the intake of the air collection filter cassette at this location was positioned at a height of about 3 feet above the ground surface to represent the **breathing height** of a child. A summary of results for the ambient air samples from this monitoring station is shown in Table 5-1 (Ambient Air Monitoring Station Air Sample Summary Results).

The dust monitor, used to measure total dust, was positioned at the same height as the air collection filter cassette. See Appendix B for a summary of the results from the dust monitor from this location and from other dust monitors used during sampling.

5.4.1.2 Fixed Ambient Air Sampling for Activity-Based Reference Level Determinations

<u>Southern Reference Area at the El Dorado Hills Community Park, Silva Valley Elementary School, and Rolling Hills Middle School</u>

One day prior to starting the activity-based outdoor air sampling at the El Dorado Hills Community Park, Silva Valley Elementary School, and Rolling Hills Middle School, the START positioned and began operating five high-flow air sample pumps at the park and the two schools. The five fixed ambient outdoor reference air sample locations, which are shown as the Southern Reference Area on Figure 5-1 (Fixed Ambient Outdoor Air Sampling Locations), are the following:

SRA-R01	Community Park, west of main office
SRA-R02	Community Park courtyard between main office and pool area
SRA-R03	Rolling Hills Middle School at the southern end of the campus

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter
[1] AAMS-D107-100304 is a duplicate sample for (i.e., co-located with) AAMS-D07-100304
[2] field blank sample
[3] filter blank sample

SRA-R04	Silva Valley Elementary School at the southwestern corner of the campus
SRA-R05	On Community Park property in open space west of the North Field baseball playing field

Location SRA-R01 was originally sited close to El Dorado Hills Boulevard under the flag pole (SRA-R01a). The location was later changed (October 4, 2004) to a spot closer to the main office (SRA-R01b) due to problems obtaining electrical power to operate the air sample pump at that location and because park personnel wanted to remove the turf covering the driveway that passes through that area since it had become muddy and posed a hazard to drivers.

The START collected air samples on air filters from these fixed locations in the Southern Reference Area daily over an approximately 8-hour time interval one day prior to, each day during, and the day after the activity-based outdoor air sampling was conducted at the Community Park (including along the New York Creek Nature Trail) and the southern two schools. The daily time interval generally coincided with the activity-based scenario sampling time periods at the park and schools. The intakes of the air collection filter cassettes were positioned at a height of about 3 feet above the ground surface. This height was selected so as to be the same as that of the air collection filter cassette intakes that were used during activity-based sampling to represent the breathing height of a child. A dust monitor was co-located with the air sample pump at Rolling Hills Middle School at the southern end of the campus (SRA-R03), and total dust concentrations were monitored. The dust monitor was positioned at the same height as the air collection filter cassette. A summary of results for the Southern Reference Area samples is shown in Table 5-2 (Southern Reference Area Air

Sample Summary Results). See Appendix B for a summary of the results from the dust monitor from these locations.

<u>Northern Reference Area Around Jackson Elementary School</u>

One day prior to conducting activity-based outdoor air sampling at Jackson Elementary School, the START positioned five high-flow air sample pumps at five locations in the vicinity of the school. The five fixed ambient outdoor reference air sample locations, which are shown as the Northern Reference Area on Figure 5-1 (Fixed Ambient Outdoor Air Sampling Locations), are the following:

NRA-R01	St. Andrews Park
NRA-R02	Art Weisberg Park, on the east side of the park in a grassy area among the trees
NRA-R03	Art Weisberg Park, on the west side of the park in an open grassy area next to Pendleton Drive
NRA-R04	Adjacent to the walkway that joins the nearby residential neighborhood to the northern end of the New York Creek Nature Trail
NRA-R05	On the median of El Dorado Hills Boulevard just north of Campbell Ranch Drive

The START collected air samples on air filters from these fixed locations daily over an approximately 8-hour time interval one day prior to, the day of, and the day after the activity-based outdoor air sampling was conducted at Jackson Elementary School. The daily time interval generally coincided with the activity-based scenario sampling time periods at the school. The intakes of the air collection filter cassettes were positioned at a height of about 3 feet above the ground surface. This height was selected so as to be the same as that of the air collection filter cassette intakes that were used during activity-based sampling to represent the breathing

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

height of a child. A dust monitor was co-located with the air sample pump at Art Weisberg Park, on the west side of the park in an open grassy area next to Pendleton Drive (NRA-R03), and total dust concentrations were monitored. The dust monitor was positioned at the same height as the air collection filter cassette. A summary of results for the Northern Reference Area samples is shown in Table 5-3 (Northern Reference Area Air Sample Summary Results). See Appendix B for a summary of the results from the dust monitor from these locations.

5.4.1.3 Perimeter Monitoring on the New York Creek Nature Trail

On October 3 and October 9, 2004, the START placed five high-flow air sample pumps along the New York Creek Nature Trail to collect ambient outdoor air samples during those two days. The START was not conducting activity-based air sampling in the immediate vicinity on those two days, but members of the public were active in the park and on the trail. On October 3, a dog-walk event was held in the park, and on October 9 the trail was open to normal activity for a Saturday.

The locations of the five stationary sample pumps that were operated on the trail on October 3 are shown as CC2-1CT, CC2-2CT, CC2-3CT, CC2-4CT, and CC2-5CT, and the locations of the five sample pumps that operated on October 9 are shown as TRA-1TR/TRA11TR, TRA-2TR, TRA-3TR, TRA-4TR, and TRA-5TR on Figure 5-2 (New York Creek Nature Trail Perimeter Monitoring Locations). The START collected air samples on air filters from these stationary locations over an approximately 8-hour time interval on these two days. The intakes of the air collection filter cassettes in stationary locations along the trail were

Figure 5-2

positioned at a height of about 5 feet above the ground surface to represent the breathing height of an adult. A summary of results for the trail perimeter samples is shown in Table 5-4 (New York Creek Nature Trail Perimeter Monitoring Air Sample Summary Results).

Dust monitors were co-located with two of the air sample pumps (CC2-1CT and CC2-3CT) on October 3 and with all five air sample pumps on October 9. These dust monitors measured total dust concentrations along the trail. The dust monitors were positioned at the same height as the air collection filter cassettes. See Appendix B for a summary of the results from the dust monitor from these locations.

5.4.2 Activity-Based Air Sampling

The START conducted activity-based air sampling according to the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Activity-Based Outdoor Air Sampling of Community Park and Schools Field Sampling Plan* and the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Activity-Based Outdoor Air Sampling of Community Park Children's Playground Field Sampling Plan*. The types of activities the START conducted during activity-based outdoor air sampling included simulating work and play on baseball fields, soccer fields, basketball courts, playgrounds, and a hiking trail. Changes to these plans, if any, are noted in the discussion below.

The START conducted activity-based outdoor air sample collection at the following locations during 19 different activity-based sampling events or scenarios. These areas are illustrated on Figure 5-3 (Scenarios Location Map):

Level C personal protective equipment
Protective equipment to protect the body against contact with known or anticipated chemical hazards has been divided into four categories known as Levels A, B, C, and D. Level C generally includes the use of an air purifying respirator for inhalation protection.

Members of the sampling team wore personal air monitoring pumps and **Level C personal protective equipment** while conducting activities within scripted scenarios to collect samples on air collection filter cassettes. The majority of the scenarios were designed to simulate primarily the activities of children, with simulation of adult activities as a small component. Some of the scenarios included simulation of only child activities, and some scenarios included simulation of only adult activities. Air collection filter cassettes were placed at a height of about 3 feet above ground surface to represent the breathing height of a child and about 5 feet above ground surface to represent the breathing height of an adult.

At each of the areas of concern the sampling team conducted the scenarios for the duration of the event, engaging in dust generation

Figure 5-3

activities that could disturb asbestos fibers and release them into the air. The level of activity ranged from minimal to aggressive dust generation. Except as noted, the sampling team conducted each scenario for 2 hours. For all baseball and soccer scenarios, members of the sampling team who participated as players wore baseball cleats.

Activities within each scenario area were conducted by a specific number of people (either five, six, or seven, depending on the activity). When a member of the sampling team took a break from the activity, another member of the sampling team took his or her place in the scenario so that the number of people conducting scenario activities remained constant. The sample pumps and dust monitors were carried in removable work belts to facilitate the exchange of sampling team members as needed.

In addition to the personal air sample pumps worn by members of the sampling team, and except as noted, the START positioned several stationary air sample pumps within each scenario activity and upwind and downwind of scenario activity. For activity-based sampling scenarios conducted at the baseball playing fields at the Community Park, the START also positioned stationary sampling pumps at the Children's Playground at the Community Park. The intakes for the air collection filter cassettes of the stationary sample pumps were set at a height of about 3 feet, except as noted.

Field conditions required the START to make several changes to the FSPs, most of which are related to the sampling schedule. Table 5-5 (Final Schedule of Field Work) shows the final sampling schedule as conducted.

Table 5-5 Final Schedule of Field Work

5.4.2.1 Silva Valley Elementary School

Field Maintenance Scenario. The baseball playing field at Silva Valley Elementary School is ordinarily maintained by parent volunteers during the playing season. The school district closed the field to Little League play during 2004. The field was mowed routinely, but grass had been allowed to grow over the basepaths and pitcher's mound areas. To conduct the baseball scenarios, the pitcher's mound and basepaths had to be cleared to bare soil, so the START added a new "field maintenance" scenario to the schedule. In doing so, the START was able to collect samples representing activities of parent volunteers while restoring the field to a condition suitable for conducting baseball play scenarios.

The START conducted the field maintenance scenario on October 2, 2004. The field maintenance scenario was conducted with six members of the sampling team simulating adult/parent volunteers who used rakes, hoes, and other garden tools to clear the basepaths and the pitcher's mound area. Sampling team members removed the grass and weeds from the areas cleared, shaking loose the dirt from the roots as needed, then placed the material that was removed in plastic garbage bags, which were later taken to the local dump in accordance with appropriate disposal procedures.

During the field maintenance scenario each member of the sampling team wore a personal air monitoring pump whose intake was set at a height of about 5 feet above ground surface to approximate the breathing height of parent volunteers. The intakes were also set at a height of about 5 feet for the air collection filter cassettes of the stationary sample pumps for the field maintenance scenario.

The outline of the field and the positions of the stationary air sample pumps operating during the field maintenance scenario are shown as SVM-1FD, SVM-2FD, SVM-3FD, SVM-4FD, and SVM-5FD on Figure 5-4 (Silva Valley Elementary School Baseball Playing Field Activity-Based Outdoor Air Sampling Locations–Maintenance Scenario). The position of the mobile meteorological station is shown as SVM-MS. A summary of results for the field maintenance scenario samples is shown in Table 5-6 (Silva Valley Elementary School Baseball Playing Field Maintenance Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

Baseball Scenario A. The playing field at Silva Valley Elementary School was initially wet when the START arrived, and after clearing the basepaths and pitcher's mound the soil was still fairly moist. The purpose of the sampling during the baseball scenarios was to simulate baseball play on the field during the dry season, so instead of conducting two more baseball play scenarios immediately after the maintenance scenario, the START revised the planned sampling schedule. The START conducted one baseball play scenario on the field on the afternoon following the maintenance scenario (October 2, 2004), but then waited until the next morning to conduct the second baseball play scenario to allow the soil to dry out somewhat. This change impacted the schedule for scenarios that had been planned for the following day, so one of the three jogging/walking scenarios on the New York Creek Nature Trail was dropped from the schedule.

Prior to conducting the baseball play scenarios at Silva Valley Elementary School, to test the moisture level of the field the START collected three soil samples from dispersed locations on

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

the field just below the top ¼ to ½ inch of soil. The START also collected soil moisture samples similarly from other playing fields and areas where activity-based sampling was conducted throughout the week. Many of these soil moisture samples were collected just prior to conducting activity-based sampling; in a few cases they were collected after activity-based sampling had already been conducted. Table 5-7 (Moisture Levels in Activity Area Soils) shows the results of the soil moisture tests conducted for the Silva Valley Elementary School baseball playing field, as well as for the other playing fields.

The START conducted activity-based outdoor air sampling during this scenario according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator walking and standing behind the backstop and sitting in the dugouts. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the first 30 minutes, five other members of the sampling team used rakes and brooms to perform types of field maintenance activities that might be conducted prior to a game. One team member swept in the dugouts, three used rakes on the dirt areas of the infield, and one observed the maintenance activities at close range to the others who were performing the work. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.
- For the remaining 90 minutes, the five other members of the sampling team alternately sat in the dugouts for 10 minutes then played baseball (infield practice) for 20 minutes; this pattern was repeated three times in the 90 minutes.

Method: ASTM D 2216-90
Matrix: soil
Analysis: moisture
units: % by weight
RL = reporting limit
* = samples from South Field collected only one time on 10/07/04 (see results for South Field Baseball Scenario A)

- During the last 30 minutes of infield practice play, a seventh member of the sampling team who was not wearing a sample pump entered the scenario to run bases and slide toward bases. This member of the sampling team was allowed to engage in more vigorous physical activity than the other members of the sampling team without having to worry about damaging the equipment or having the pumps fall out of the belts.

The outline of the field and the positions of the stationary air sample pumps operating during the first baseball scenario are shown as SVBA-1FD, SVBA-2FD, SVBA-3FD, SVBA-4FD, and SVBA-5FD on Figure 5-5 (Silva Valley Elementary School Baseball Playing Field Activity-Based Outdoor Air Sampling Locations–Baseball Scenario A). The position of the mobile meteorological station is shown as SVBA-MS. A summary of results for *Baseball Scenario A* samples is shown in Table 5-8 (Silva Valley Elementary School Baseball Scenario A Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

Baseball Scenario B. The START collected soil samples to test the moisture level again immediately prior to conducting the second baseball play scenario at Silva Valley Elementary School (see Table 5-7: Moisture Levels in Activity Area Soils).

The START conducted *Baseball Scenario B* on October 3, 2004. The START conducted activity-based outdoor air sampling during the second baseball play scenario according to the same scripted schedule that was used for *Baseball Scenario A*.

The outline of the field and the positions of the stationary air sample pumps operating during the second baseball scenario are

See Appendix B for a summary of the results from dust monitoring during this scenario.

5.4.2.2 Rolling Hills Middle School

The logistics of conducting one scenario at Silva Valley Elementary School in the morning, and then moving all the equipment and personnel to Rolling Hills Middle School to conduct two more scenarios took more time than was anticipated. In order to complete scenarios at both the soccer field and the basketball play area at Rolling Hills Middle School before dark, the START cut the length of time the soccer scenario was performed; instead of 2 hours the soccer scenario was stopped after about 1.5 hours of activity had been completed.

Soccer Scenario. The START collected soil samples to test the moisture level immediately prior to conducting the soccer scenario at Rolling Hills Middle School (see Table 5-7: Moisture Levels in Activity Area Soils). The soccer scenario activity was conducted on a rectangular area toward the southern end of the field where the START observed bare areas in the grass.

The START conducted activity-based outdoor air sampling during the soccer scenario on October 3, 2004, according to the following scripted schedule:

Figure 5-6

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

- For the entire 1.5-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator sitting near the edge or walking around and occasionally within the area of play. This member of the sampling team would sometimes retrieve a ball kicked out of the area of play. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire 1.5-hour scenario, five other members of the sampling team passed soccer balls back and forth to each other. They sometimes formed a small circle to practice passing; other times they dribbled the ball across the field with other sampling team members close by. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.

The area within which the START conducted the activity is outlined and the positions of the stationary air sample pumps operating during the soccer scenario are shown as RHS-1FD, RHS-2FD, RHS-3FD, RHS-4FD, and RHS-5FD on Figure 5-7 (Rolling Hills Middle School Soccer Field Activity-Based Outdoor Air Sampling Locations–Soccer Scenario). The position of the mobile meteorological station is shown as RHS-MS. A summary of results for the soccer scenario samples is shown in Table 5-10 (Rolling Hills Middle School Soccer Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

Basketball Scenario. The START conducted the basketball scenario on a half court of one of the basketball courts at Rolling Hills Middle School on October 3, 2004.

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

The START conducted activity-based outdoor air sampling during the basketball scenario according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator sitting near the edge or walking around and occasionally within the area of play. This member of the sampling team would sometimes retrieve a ball that bounced out of the area of play. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the first 10 minutes, two other members of the sampling team used brooms to sweep the half-court, two dribbled basketballs around the half-court, and one walked close by those sweeping or dribbling. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.
- For the remaining 110 minutes, these five other members of the sampling team played basketball and conducted practice drills according to the following 10-minute activity modules:
    - Layups
    - Top of the Key
    - Half-Court Game
    - Foul Line Shots
    - Layups
    - Top of the Key
    - Half-Court Game
    - Foul Line Shots
    - Layups
    - Top of the Key
    - Free Shots

The area within which the START conducted the activity is outlined and the positions of the stationary air sample pumps operating during the basketball scenario are shown as RHB-1FD, RHB-2FD, RHB-3FD, RHB-4FD, and RHB-5FD on Figure 5-8 (Rolling Hills Middle School Activity-Based Outdoor Air Sampling Locations–Basketball Scenario). The position of the mobile meteorological station is shown as RHB-MS. A summary of results for the basketball scenario samples is shown in Table 5-11 (Rolling Hills Middle School Basketball Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

5.4.2.3 Children's Playground at the Community Park

The START conducted two scenarios at the Children's Playground at the Community Park on October 4, 2004: a *Typical Activity Scenario* and an *Aggressive Activity Scenario*. The plan for these scenarios, as described in the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Activity-Based Outdoor Air Sampling of Community Park Children's Playground Field Sampling Plan*, had called for members of the sampling team to simulate typical levels of children's play activity during the *Typical Activity Scenario* and a slightly more vigorous level of activity during the *Aggressive Activity Scenario*. To limit the variables between the two scenarios, however, U.S. EPA directed members of the sampling team to simulate children's play at about the same level of activity for both scenarios. The primary differences between the two scenarios were the addition of the following for the *Aggressive Activity Scenario*:

- A leaf blower was used just prior to conducting scenario activity on each side of the playground.

Figure 5-8

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

- Several box fans were set up in rings around each side of the playground to blow air toward the center of the playground during the scenario.

For both scenarios, the intakes for the air collection filter cassettes worn by the sampling team members were set at a height of about 3 feet. No stationary air sample pumps were operated during the either of the Children's Playground scenarios.

Typical Activity Scenario. The START performed the *Typical Activity Scenario* first. The START conducted activity-based outdoor air sampling during the scenario according to the following scripted schedule (see Table 5-12: Children's Playground Scenario Activities):

- For the first hour of the scenario five members of the sampling team simulated the activities of children playing in the western portion of the Children's Playground, which has a wood chip ground cover. One member of the sampling team conducted solitary play activities during the scenario, while the other four sampling team members conducted activities in two pairs. They alternated activities every 10 minutes, as shown in Table 5-12 (Children's Playground Scenario Activities).
- For the second hour of the scenario five members of the sampling team simulated the activities of children playing in the eastern portion of the Children's Playground, which has rubber-like playground surface in most of the area and a sand box in one corner. One member of the sampling team continued to conduct solitary play activities during the scenario, while the other four sampling team members conducted activities in two pairs. They alternated activities every 10 minutes, as shown in Table 5-12 (Children's Playground Scenario Activities).

Table 5-12 Children's Playground Scenario Activities						
Western Portion of Playground (with wood chip ground cover)						
	0 to 10 minutes	**10 to 20 minutes**	**20 to 30 minutes**	**30 to 40 minutes**	**40 to 50 minutes**	**50 to 60 minutes**

Pair B	sand box	ball	play structure	sand box	ball	play structure
Solitary Player	ball	play structure	sand box	ball	play structure	sand box

<u>*Aggressive Activity Scenario*</u>. The START performed the *Aggressive Activity Scenario* second, with a break of more than an hour between the *Typical Activity Scenario* and the *Aggressive Activity Scenario*. The START conducted activity-based outdoor air sampling during the scenario according to the following scripted schedule:

- For about 20 minutes prior to starting the scenario, one member of the sampling team used a leaf blower in the western portion of the Children's Playground, which has a wood chip ground cover. The START placed several box fans in a ring around this portion of the playground facing the center of the area. The team member using the leaf blower turned on each of the fans as he walked around in that portion of the playground blowing toward the ground, at the play structures, and up toward the shade canopy. See Table 5-13: Status of Leaf Blower and Fans During Aggressive Activity Scenario.
- The leaf blower was turned off but the fans remained turned on, and for the first hour of the scenario five members of the sampling team simulated the activities of children playing in the western portion of the Children's Playground. As was done during the *Typical Activity Scenario*, one member of the sampling team conducted solitary play activities during the scenario, while the other four sampling team members conducted activities in two pairs. They alternated activities every 10 minutes, as shown in Table 5-12 (Children's Playground Scenario Activities).

Table 5-13
Status of Leaf Blower and Fans During Aggressive Activity Scenario

20 minutes before start of scenario	0 to 40 minutes	40 to 60 minutes	60 to 120 minutes
use leaf blower in western portion; turn on fans in western portion	leaf blower off; fans remain on in western portion	use leaf blower in eastern portion; turn on fans in eastern portion; fans still on in western portion or in transit to eastern portion	leaf blower off; fans on in eastern portion; fans off in western portion
no activity-based sampling	activity-based sampling in western portion	activity-based sampling in western portion	activity-based sampling in eastern portion

- For about the last 20 minutes of the first hour, while the five members of the sampling team were still conducting scenario activities in the western portion of the Children's Playground, another member of the sampling team used a leaf blower in the eastern portion of the playground. This side of the playground has a rubber-like ground surface and a sand box. The START placed several other box fans in a circle around this portion of the playground, and the team member using the leaf blower turned on each of the fans as he walked around in that portion of the playground blowing toward the ground and at the play structures.
- The leaf blower was then turned off while the fans remained turned on, and for the second hour of the scenario five members of the sampling team simulated the activities of children playing in the eastern portion of the Children's Playground. One member of the sampling team continued to conduct solitary play activities during the scenario, while the other four sampling team members conducted activities in two pairs.

They alternated activities every 10 minutes, as shown in Table 5-12 (Children's Playground Scenario Activities).

The outline of the Children's Playground is shown on Figure 5-9 (Community Park Children's Playground Activity-Based Outdoor Air Sampling Area–Typical and Aggressive Activity Scenarios). The position of the mobile meteorological station (which was used only during the Typical Activity Scenario) and the Ambient Air Monitoring Station are shown as TPG-MS and AAMS, respectively. The position of the mobile meteorological station is shown as RHB-MS. A summary of results for the playground scenario samples is shown in Table 5-14 (Community Park Children's Playground Typical and Aggressive Activity Scenarios Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during these scenarios.

5.4.2.4 Playing Fields at the Community Park

During the baseball and soccer scenarios conducted on the playing fields at the Community Park, the START operated additional stationary high-flow air sample pumps at the Children's Playground.

North Field Baseball Playing Field. The START conducted activity-based outdoor air sampling at the North Field on October 5. The START intended to collect soil samples to test the moisture level of the field prior to conducting the scenario, but this was inadvertently overlooked. The soil moisture samples were collected instead on October 7, 2004 (see Table 5-7: Moisture Levels in Activity Area Soils).

The START conducted activity-based outdoor air sampling at the North Field, according to the following scripted schedule:

Figure 5-9

Table 5-14
Community Park Children's Playground Typical and Aggressive Activity Scenarios Air Sample Summary Results

Sample ID	Location	Location Description	Date	PCME Structures (s/cc)	AHERA-like Total Structures (s/cc)	Sensitivity (s/cc)

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator walking and standing behind the backstop and sitting on the bleachers and in the dugouts. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the first 10 minutes, another member of the sampling team drove an electric maintenance cart towing a steel drag mat around to groom the infield. The cart and drag mat are the same equipment the CSD maintenance staff use to groom the infields prior to games. Use of the cart and drag mat mimicked CSD infield maintenance procedures, except that the START did not wet the infield down, as would normally be done prior to dragging, in an attempt to capture the upper end of exposure levels. During the infield dragging, two other members of the sampling team sat in the dugouts, and another two members of the sampling team walked around the infield, occasionally within or near the cloud of dust created by the drag mat. The intakes for the air collection filter cassettes worn by these five sampling team members were set at a height of about 3 feet.
- For the next 20 minutes, the electric cart and drag mat were set aside, and these five members of the sampling team walked around in the infield and spectator areas and used hand tools to perform field grooming tasks. One member of the sampling team swept the dugouts, one swept behind the backstops near the spectator bleachers, one used a dirt rake on the infield dirt, one walked around the bases, and one used a dirt tamp to tamp around the pitcher's mound and home plate.
- For the remaining 90 minutes, the five members of the sampling team simulating the activities of children alternately sat in the dugouts for 10 minutes then played baseball (infield prac-

tice) for 20 minutes; this pattern was repeated three times in the 90 minutes.

- During the last 30 minutes of infield practice play, a seventh member of the sampling team who was not wearing a sample pump entered the scenario to run bases and slide toward bases. This member of the sampling team was allowed to engage in more vigorous physical activity than the other members of the sampling team without having to worry about damaging the equipment or having the pumps fall out of the belts.

The outline of the field and the positions of the stationary air sample pumps operating during the North Field baseball scenario are shown as NFB-1FD, NFB-2FD, NFB-3FD, NFB-4FD, NFB-5FD, NFB-1PG, NFB-2PG, NFB-3PG, NFB-4PG, and NFB-5PG on Figure 5-10 (Community Park North Field Activity-Based Outdoor Air Sampling Locations–Baseball Scenario). Two composite samples collected during both baseball scenarios conducted on October 5 are shown as CC2-05-1CP and CC2-05-2CP. The position of the mobile meteorological station is shown as NFB-MS. A summary of results for the baseball scenario samples is shown in Table 5-15 (Community Park North Field Baseball Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

<u>*South Field Baseball Playing Field*</u>. The START conducted three baseball scenarios on the South Field at the Community Park. One scenario was conducted on October 5 (*Baseball Scenario A*), and two were conducted on October 6, 2004 (*Baseball Scenario B* and *Baseball Scenario C*). The START intended to collect soil samples to test the moisture level of the field prior to conducting each scenario, but this was inadvertently overlooked. Instead, a single set of soil moisture samples was collected for the South Field on

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

October 7, 2004 (see Table 5-7: Soil Moisture Levels in Activity Area Soils).

The START conducted *Baseball Scenario A* and *Baseball Scenario B* according to the same scripted schedule used for the North Field. For *Baseball Scenario C*, however, the START conducted it entirely as a baseball infield practice scenario. The first 30 minutes of field maintenance activity (including the use of the steel drag mat) was replaced with infield practice play, so the scenario was still 2 hours in length.

South Field *Baseball Scenario A*. The START conducted activity-based outdoor air sampling during *Baseball Scenario A* at the South Field according to the same scripted schedule that was used for the North Field.

The outline of the field and the positions of the stationary air sample pumps operating during the South Field *Baseball Scenario A* are shown as SFBA-1FD, SFBA-2FD, SFBA-3FD, SFBA-4FD, SFBA-5FD, SFBA-1PG, SFBA-2PG, SFBA-3PG, SFBA-4PG, and SFBA-5PG on Figure 5-11 (Community Park South Field Activity-Based Outdoor Air Sampling Locations–Baseball Scenario A). Two composite samples collected during both baseball scenarios conducted on October 5 are shown as CC2-05-1CP and CC2-05-2CP. The position of the mobile meteorological station is shown as SFBA-MS. A summary of results for *Baseball Scenario A* samples is shown in Table 5-16 (Community Park South Field Baseball Scenario A Air Sample Summary Results).

South Field *Baseball Scenario B*. The START conducted activity-based outdoor air sampling during *Baseball Scenario B* at the South Field according to the same scripted schedule that was used for the North Field.

The outline of the field and the positions of the stationary air sample pumps operating during the South Field *Baseball Scenario B* are shown as SFBB-1FD/SFBB-11FD/SFBB-21FD, SFBB-2FD, SFBB-3FD, SFBB-4FD, SFBB-5FD, SFBB-1PG/SFBB-11PG, SFBB-2PG, SFBB-3PG, SFBB-4PG, and SFBB-5PG on Figure 5-12 (Community Park South Field Activity-Based Outdoor Air Sampling Locations–Baseball Scenario B). Two composite samples collected during both baseball scenarios conducted on October 6 are shown as CC5-1CP and CC5-2CP. The position of the mobile meteorological station is shown as SFBB-MS. A summary of results for *Baseball Scenario B* samples is shown in Table 5-17 (Community Park South Field Baseball Scenario B Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

South Field *Baseball Scenario C* (Without Field Maintenance). The START conducted activity-based outdoor air sampling during *Baseball Scenario C* at the South Field according to the same scripted schedule that was used for the North Field, except that the maintenance component of the scenario was eliminated. Instead, during the first 30 minutes the five other sampling team members (i.e., all but the sampling team member simulating a parent/adult spectator) conducted infield practice. For the remaining 90 minutes of the scenario, activities were conducted in the same manner as for the North Field.

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

Sampling Locations–Baseball Scenario). Two composite samples collected during both baseball scenarios conducted on October 7 are shown as CC6-1CP and CC6-2CP. The position of the mobile meteorological station is shown as NYB-MS. A summary of results for the baseball scenario samples is shown in Table 5-19 (Community Park New York Creek Field Baseball Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

Lower Soccer Field at the Community Park (Between North Field and South Field. The START collected soil samples to test the moisture level of the field just prior to conducting the scenario at the Lower Soccer Field (see Table 5-7: Soil Moisture Levels in Activity Area Soils).

The soccer scenario activity was conducted in three 40-minute sequential sessions on three separate rectangular areas where the grass was noted to be slightly barer than on other parts of the field. The START conducted activity-based outdoor air sampling during the soccer scenario at the lower soccer field on October 7, 2004, according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator sitting near the edge or walking around and occasionally within the area of play. This member of the sampling team would sometimes retrieve a ball kicked out of the area of play. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

- For the entire 2-hour scenario, five other members of the sampling team passed soccer balls back and forth to each other. They sometimes formed a small circle to practice passing; other times they dribbled the ball across the field with other sampling team members close by. They spent 40 minutes on each of three areas of the field. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.

The three areas within which the START conducted the activity are outlined and the positions of the stationary air sample pumps operating during the soccer scenario are shown as CPS-1FD, CPS-2FD, CPS-3FD, CPS-4FD, CPS-5FD, CPS-1PG, CPS-2PG, CPS-3PG, CPS-4PG, and CPS-5PG on Figure 5-15 (Community Park Lower Soccer Field Activity-Based Outdoor Air Sampling Locations–Soccer Scenario). Two composite samples collected during both baseball scenarios conducted on October 7 are shown as CC6-1CP and CC6-2CP. The position of the mobile meteorological station is shown as CPS-MS. A summary of results for the baseball scenario samples is shown in Table 5-20 (Community Park Lower Soccer Field Soccer Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

5.4.2.5 New York Creek Nature Trail

The START conducted activity-based outdoor air sampling during one biking and two jogging/walking scenarios along the New York Creek Nature Trail. The trail was officially closed to public use during the activity-based sampling, but a few members of the public did enter the trail during sampling in spite of its closure.

The plan for the trail scenarios, as described in the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Activity-Based Outdoor Air Sampling of Community Park and Schools Field Sampling Plan*, had called for the START to conduct three jogging/walking scenarios. Changes to the schedule for sampling at Silva Valley Elementary School impacted the schedule for scenarios that had been planned for the following day, necessitating that one of the three jogging/walking scenarios on the New York Creek Nature Trail be dropped.

Biking Scenario. During the biking scenario on the New York Creek Nature Trail, five members of the sampling team rode bicycles along the southern end of the trail from Harvard Way through the Community Park and slightly beyond its northern border at St. Andrews Drive. The START placed five high-flow stationary air sample pumps along the trail where the bicyclists rode. The START also placed two other high-flow stationary air sample pumps along the northern end of the trail where there was no activity from the bicyclists. The intakes for the high-flow stationary air sample pumps were positioned at a height of about 5 feet.

The START conducted the biking scenario on October 5, 2004, according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent walking and standing along the trail. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire 2-hour scenario, five other members of the sampling team rode bicycles along the trail. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet. Four sampling team members rode in two separate pairs, and one rode alone, although the sets of riders passed one another periodically during the scenario. For the bicyclists who rode in pairs, the relative position (i.e., leader and follower) remained constant throughout the entire scenario. Table 5-21 (Biking Scenario Positions) shows the configuration of the bicyclists during the scenario.

Table 5-21
Biking Scenario Positions

Pair A	Leader Follower	BIK-2CH BIK-1CH
Pair B	Leader Follower	BIK-3CH BIK-5CH
Solitary Rider		BIK-4CH

The portion of the trail along which the START conducted the biking activity is shown and the positions of the stationary air sample pumps operating during the biking scenario are shown as BIK-1TR/BIK-11TR, BIK-2TR, BIK-3TR, BIK-4TR, BIK-5TR, BIK-6TR, and BIK-7TR on Figure 5-16 (New York Creek Nature Trail Activity-Based Outdoor Air Sampling Locations–Biking Scenario). A summary of results for the biking scenario samples is

Figure 5-16

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

shown in Table 5-22 (New York Creek Nature Trail Biking Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

<u>*Jogging/Walking Scenario A*</u>. During the first jogging/walking scenario on the New York Creek Nature Trail, five members of the sampling team jogged and walked along the entire length of the trail from Harvard Way through the Community Park and up to the end of the trail near Jackson Elementary School. The START placed five high-flow stationary air sample pumps along the length of the trail. The intakes for the high-flow stationary air sample pumps were positioned at a height of about 5 feet.

The START conducted the *Jogging/Walking Scenario A* on October 6, 2004, according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent walking and standing along the trail. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire 2-hour scenario, five members of the sampling team simulated the activities of an adult/parent jogging and walking along the trail. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 5 feet. Three sampling team members jogged and walked in a group with one jogger in the lead position and two others following far behind (about 20 to 30 feet) but staying fairly close to one another. Two other sampling team members jogged as a pair close to each other.
- For each jogger/walker group of two or three sampling team members, the relative positions of the joggers remained the same throughout the scenario. That is, for the trio, the far

leader, second leader, and follower remained in those positions throughout the entire scenario. For the pair, the leader and the follower remained in those positions. Table 5-23 (Positions for Jogging/Walking Scenario A) shows the configuration of the jogger/walkers during the first jogging/walking scenario.

Table 5-23
Positions for Jogging/Walking Scenario A

Trio	Far Leader Second Leader Follower	JOGA-1AD JOGA-3AD JOGA-2AD
Pair	Leader Follower	JOGA-4AD JOGA-5AD

The entire length of the trail along which the START conducted the jogging/walking activity is shown and the positions of the stationary air sample pumps operating during *Jogging/Walking Scenario A* are shown as JOGA-1TR, JOGA-2TR, JOGA-3TR, JOGA-4TR, and JOGA-5TR on Figure 5-17 (New York Creek Nature Trail Activity-Based Outdoor Air Sampling Locations–Jogging/Walking Scenarios). A summary of results for *Jogging/Walking Scenario A* samples is shown in Table 5-24 (New York Creek Nature Trail Jogging/Walking Scenario A Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

Jogging/Walking Scenario B. The START conducted the *Jogging/Walking Scenario B* on October 7, 2004, according to the same scripted schedule that was used for *Jogging/Walking Scenario A*. Table 5-25 (Positions for Jogging/Walking Scenario B) shows the configuration of the jogger/walkers during the second jogging/walking scenario.

Trio	Far Leader Second Leader Follower	JOGB-1AD JOGB-2AD JOGB-3AD
Pair	Leader Follower	JOGB-4AD JOGB-5AD

The entire length of the trail along which the START conducted the jogging/walking activity is shown and the positions of the stationary air sample pumps operating during *Jogging/Walking Scenario B* are shown as JOGB-1TR, JOGB-2TR/JOGB-12TR, JOGB-3TR, JOGB-4TR, and JOGB-5TR on Figure 5-17 (New York Creek Nature Trail Activity-Based Outdoor Air Sampling Locations–Jogging/Walking Scenarios). A summary of results for *Jogging/Walking Scenario B* samples is shown in Table 5-26 (New York Creek Nature Trail Jogging/Walking Scenario B Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

5.4.2.6 Jackson Elementary School

The START conducted activity-based air sampling during three scenarios at the garden and outdoor classroom, the grass-covered playing field, and two paved play areas. Because the paved play areas selected for the activity were physically separate from one another, the START placed additional high-flow air sample pumps in stationary positions in each area, but only operated them within each area for the 1 hour of the scenario when activity was conducted there.

s/cc = structures per cubic centimeter

<u>*Garden and Outdoor Classroom*</u>. The START collected samples to test the moisture level of the soil just prior to conducting the scenario at the Garden and Outdoor Classroom (see Table 5-7: Moisture Levels in Activity Area Soils).

The START conducted activity-based outdoor air sampling during the garden and outdoor classroom scenario on October 10, 2004, according to the following scripted schedule:

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/teacher sitting, standing, walking, and gardening. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire 2-hour scenario, five other members of the sampling team simulated the activities of a students sitting, standing, walking, and gardening. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.
- Members of the sampling team conducted the activity in pairs, each pair spending 20 minutes twice during the 2 hours at each of three areas within the garden and outdoor classroom. The three areas included the garden plots and area in front of the garden shed in the northwest corner, the benches in front of the chalkboard, and the tables and area in front of the garden shed in the southwest corner.
- At the garden plots and area in front of the garden shed in the northwest corner, activity included using rakes and hoes and scooping dirt into a bucket and dumping it out. At the benches in front of the chalkboard, activity included sitting and shuffling feet and walking around. At the tables and area in front of the garden shed in the southwest corner, activity also included

using rakes and hoes and scooping dirt into a bucket and dumping it out.

The outline of the garden and outdoor classroom area and the positions of the stationary air sample pumps operating during the scenario are shown as JEG-1FD, JEG-2FD, JEG-3FD, JEG-4FD, and JEG-5FD on Figure 5-18 (Jackson Elementary School Garden and Outdoor Classroom Activity-Based Outdoor Air Sampling Locations–Garden/Outdoor Classroom Scenario). The position of the mobile meteorological station is shown as JEG-MS. A summary of results for the garden/outdoor classroom scenario samples is shown in Table 5-27 (Jackson Elementary School Garden/Outdoor Classroom Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

<u>*Grass-Covered Playing Field–Soccer Scenario*</u>. The START collected soil samples to test the moisture level just prior to conducting the soccer scenario at the grass-covered playing field at Jackson Elementary School (see Table 5-7: Moisture Levels in Activity Area Soils).

The soccer scenario activity was conducted in twelve 10-minute sequential sessions on three separate rectangular areas where the grass was noted to be slightly barer than on other parts of the field. (The sampling team members conducted four 10-minute sessions for a total of 40 minutes in each of the three areas.) The START conducted activity-based outdoor air sampling during the soccer scenario at the grass-covered playing field on October 10, 2004, according to the following scripted schedule:

PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
AHERA-like total structures = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA structure definition)
Sensitivity = the sample-specific lowest concentration of asbestos the laboratory can reliably detect
s/cc = structures per cubic centimeter

- For the entire 2-hour scenario, one member of the sampling team simulated the activities of an adult/parent spectator sitting near the edge or walking around and occasionally within the area of play. This member of the sampling team would sometimes retrieve a ball kicked out of the area of play. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire 2-hour scenario, five other members of the sampling team passed soccer balls back and forth to each other. They sometimes formed a small circle to practice passing; other times they dribbled the ball across the field with other sampling team members close by. They spent 40 minutes on each of three areas of the field. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.

The three areas within which the START conducted the activity are outlined and the positions of the stationary air sample pumps operating during the soccer scenario are shown as JEP-1FD, JEP-2FD, JEP-3FD, JEP-4FD, and JEP-5FD/JEP-15FD on Figure 5-19 (Jackson Elementary School Grass-Covered Playing Field Activity-Based Outdoor Air Sampling Locations–Soccer Scenario). The position of the mobile meteorological station is shown as JEP-MS. A summary of results for the soccer scenario samples is shown in Table 5-28 (Jackson Elementary School Soccer Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

<u>Basketball and Kindergarten Playground Scenario</u>. For the basketball and kindergarten playground scenario on October 10, 2004, the START conducted activity-based outdoor air sampling for 1 hour on a half court of one of the basketball courts at Jackson Elementary School and 1 hour in the paved portion of the kindergarten playground. The START did not perform a maintenance component of the basketball portion of the scenario. The upwind high-flow air sample pump (JEB-4FD) was operated for the entire 2 hours and serves as the upwind sample location for both halves of the scenario. The other high-flow air sample pumps were operated for 1 hour each (i.e., during each half of the scenario). The personal air sample pumps worn by sampling team members were operated for the entire 2-hour scenario.

The START conducted activity-based outdoor air sampling during the basketball portion of the scenario according to the following scripted schedule:

- For the entire hour of this half-scenario, one member of the sampling team simulated the activities of an adult/parent spectator sitting near the edge or walking around and occasionally within the area of play. This member of the sampling team would sometimes retrieve a ball that bounced out of the area of play. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.
- For the entire hour of this half-scenario, five other members of the sampling team played basketball and conducted practice drills according to the following 10-minute activity modules:
    - Half-Court Game
    - Layups
    - Top of the Key

- Foul Line Shots
- Layups
- Half-Court Game

The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.

The area within which the START conducted the activity is outlined and the positions of the stationary air sample pumps operating during the basketball portion of the scenario are shown as JEB-1FD, JEB-2FD/JEB-12FD, JEB-3FD, JEB-4FD, and JEB-5EFD on Figure 5-20 (Jackson Elementary School Basketball Court Activity-Based Outdoor Air Sampling Locations–Basketball and Kindergarten Playground Scenario). The position of the mobile meteorological station is shown as JEB-MS. A summary of results for the basketball and kindergarten playground scenario samples is shown in Table 5-29 (Jackson Elementary School Basketball and Kindergarten Playground Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

For the kindergarten playground portion of the scenario, the START conducted activity-based outdoor air sampling according to the following scripted schedule:

- For the entire hour of this half-scenario, one member of the sampling team simulated the activities of an adult/teacher standing and walking near the other members of the sampling team. The intake for the air collection filter cassette worn by this sampling team member was set at a height of about 5 feet.

- For the entire hour of this half-scenario, five other members of the sampling team played foursquare, dodgeball, and hopscotch in groups of two and three, alternating at 10-minute intervals from one side of the playground to the other. The intakes for the air collection filter cassettes worn by these sampling team members were set at a height of about 3 feet.

The area within which the START conducted the activity is outlined and the positions of the stationary air sample pumps operating during the kindergarten playground portion of the scenario are shown as JEB-4FD, JEB-5WFD, JEB-6FD, and JEB-7FD on Figure 5-21 (Jackson Elementary School Kindergarten Playground Activity-Based Outdoor Air Sampling Locations–Basketball and Kindergarten Playground Scenario). The position of the mobile meteorological station is shown as JEB-MS. A summary of results for the basketball and kindergarten playground scenario samples is shown in Table 5-29 (Jackson Elementary School Basketball and Kindergarten Playground Scenario Air Sample Summary Results). See Appendix B for a summary of the results from dust monitoring during this scenario.

5.5 SOIL SAMPLING

The START conducted soil sampling according to the *El Dorado Hills Naturally Occurring Asbestos Multimedia Exposure Assessment, El Dorado Hills, California, Soil Sampling of Community Park, Schools, and Public Areas Field Sampling Plan*. At all of the locations where the START conducted soil sampling, surface soil samples were collected. In addition, the START collected subsurface soil samples at the same surface soil sample locations at all three baseball playing fields at the Community Park (i.e., North Field, South Field, and New York Creek Field). Soil sample locations are shown on Figures 5-21 through 5-31. The soil samples are still being analyzed by a laboratory, and U.S. EPA is currently evaluating preliminary data. No results are available for release at the time of this report.

6 Hazard Ranking System Factors

HRS
U.S. EPA's Hazard Ranking System

NPL
National Priorities List (also called Superfund List)

The **Hazard Ranking System** (HRS) is the principal mechanism EPA uses to place sites on the **National Priorities List** (NPL). It is a numerically-based screening system that uses information from initial, limited investigations to assess the relative potential of sites to pose a threat to human health or the environment.

The HRS uses a structured analysis approach to determining site scores. This approach assigns numerical values to factors that relate to risk based on conditions at the site. The factors are grouped into three categories:

- Likelihood that sources of contamination at a site have released or have the potential to release hazardous substances into the environment;
- Characteristics of the waste (e.g., toxicity and waste quantity); and
- People or sensitive environments (targets) affected by the release.

Four pathways can be scored under the HRS:

- Groundwater migration (drinking water);
- Surface water migration (drinking water, human food chain, sensitive environments);
- Soil exposure (resident population, nearby population, sensitive environments); and
- Air migration (population, sensitive environments).

6.1 SOURCES OF CONTAMINATION

6.1.1 Areas of Concern

In all the locations that are the subject of the El Dorado Hills Naturally Occurring Asbestos Multimedia Assessment, areas of concern are those areas where the presence of asbestos in exposed and disturbed soil may be causing releases to air. The original expectation at the outset of the project was that asbestos present in soils would be from naturally occurring sources and would pose a potential threat of exposure because of activities that disturbed it from its natural state. Several of the playing fields where START found asbestos during activity-based air sampling (e.g., baseball playing fields at the Community Park) have imported infield mix, however, so the possibility that not all of the asbestos is endemic to El Dorado Hills must be considered.

chrysotile
A regulated mineral in the serpentine group of minerals that can crystallize as asbestos. Chrysotile is also known as serpentine asbestos.

amphibole
One of the two groups of minerals (serpentine and amphibole) that can crystallize as asbestos. The regulated asbestiform minerals of this group are crocidolite, amosite, anthophyllite asbestos, tremolite asbestos, and actinolite asbestos.

6.1.2 Contaminant Types and Quantities

Types

In samples collected during activity-based air sampling, the laboratory identified **chrysotile** and **amphibole** asbestos. The following regulated (indicated with an asterisk) and non-regulated asbestiform minerals were in air samples above the laboratory levels of detection:

- actinolite*
- amosite*
- anthophyllite*
- chrysotile*
- edenite
- ferro-edenite
- richterite (one sample)
- tremolite*
- winchite

Quantities

The New York Creek Nature Trail runs almost 2 miles starting from Harvard Way, traversing through the El Dorado Hills Community Park, and ending near Jackson Elementary School.

The three baseball playing fields at the Community Park have “skinned” infields, which means that there is no grass in their infields. There is grass covering the outfield areas, which are also used as soccer playing fields. The baseball bases are set at 60 feet apart. Imported “infield mix,” which is composed of 50% topsoil and 50% crushed lava rock, is present within the infield.

The Dirt Embankment is about 1,200 feet along the downslope edge. The width of the Dirt Embankment varies, but is estimated from aerial photographs to be about 75 feet wide at its widest point.

The Silva Valley Elementary School baseball playing field has a grass infield. When the field is maintained, the outfield and the area inside the baselines is grass (except for the pitcher’s mound), and the rest of the infield is exposed dirt (e.g., see Figure 5-4: Silva Valley Elementary School Baseball Playing Field Activity-Based Outdoor Air Sampling Locations–Maintenance Scenario). According to school district personnel, imported “infield mix” would typically be used in the dirt areas of the infield including on the basepaths and pitcher’s mound. The baseball bases are set at 60 feet apart.

6.2 GROUNDWATER MIGRATION PATHWAY

In determining a score for the groundwater migration pathway, the HRS evaluates: 1) the likelihood that sources at a site actually have released, or potentially could release, hazardous substances to groundwater; 2) the characteristics of the hazardous substances that are available for a release (i.e., toxicity, mobility, and quantity); and 3) the people (targets) who actually have been, or potentially could be, impacted by the release. For the targets component of the evaluation, the HRS focuses on the number of people who regularly obtain their drinking water from wells that are located within 4 miles of the site. The HRS emphasizes drinking water usage over other uses of groundwater (e.g., food crop irrigation and livestock watering), because, as a screening tool, it is designed to give the greatest weight to the most direct and extensively studied exposure routes.

According to the *Draft Water Resources Development and Management Plan* for El Dorado County, usable groundwater is limited in the western slope of the county. Groundwater quality in this region is said to be satisfactory but marginal. There are some wells, typically in the range of 100 to 200 feet below ground surface, but the amount of water they provide to serve the community's drinking water needs compared to surface water sources is minimal.

6.3 SURFACE WATER MIGRATION PATHWAY

In determining the score for the surface water pathway, the HRS evaluates: 1) the likelihood that sources at a site actually have released, or potentially could release, hazardous substances to surface water (e.g., streams, rivers, lakes, and oceans); 2) the characteristics of the hazardous substances that are available for a release (i.e., toxicity, persistence, bioaccumulation potential, and quantity); and 3) the people or sensitive environments (targets) who actually have been, or potentially could be, impacted by the release. For the targets component of the evaluation, the HRS focuses on drinking water intakes, fisheries, and sensitive environments associated with surface water bodies within 15 miles downstream of the site.

The El Dorado Irrigation District is the primary water purveyor in El Dorado Hills. The water supply comes from a variety of sources, essentially all from surface water sources. The largest water supply source for El Dorado Hills Irrigation District is Jenkinson Lake (Sly Park Reservoir and Dam). In addition, Folsom Lake, the South Fork of the American River (at Kyburz), the North Fork of the Cosumnes River, and Clear Creek (Crawford Ditch) provide significant supply to the system. Of these sources, all except Folsom Lake are geographically upslope of the area of concern. The New York Creek, which is an ephemeral stream, flows through the Community Park along the New York Creek Nature Trail, past Jackson Elementary School to Folsom Lake, with the point of entry just over 3 miles from the northern boundary of the Community Park.

Folsom Lake State Recreation Area is an 18,000-acre lake and recreation area offering opportunities for angling, hiking, biking, running, camping, picnicking, horseback riding, water-skiing and boating. The lake has trout, catfish, big and small mouth bass and perch.

6.4 SOIL EXPOSURE PATHWAY

In determining the score for the soil exposure pathway, the HRS evaluates: 1) the likelihood that there is surficial contamination associated with the site (e.g., contaminated soil that is not covered by pavement or at least 2 feet of clean soil); 2) the characteristics of the hazardous substances in the surficial contamination (i.e., toxicity and quantity); and 3) the people or sensitive environments (targets) who actually have been, or potentially could be, exposed to the contamination. For the targets component of the evaluation, the HRS focuses on populations that are regularly and currently present on or within 200 feet of surficial contamination. The four populations that receive the most weight are residents, students, daycare attendees, and terrestrial sensitive environments.

6.4.1 Contamination

The contaminant of concern is asbestos. The START collected soil samples from areas of concern within 2 feet of ground surface. The soil samples are still being analyzed by a laboratory, and U.S. EPA is currently evaluating preliminary data. The results are not available for release at the time of this report.

6.4.2 Population

According to the State Department of Finance, as of January 2005 there were about 31,000 residents in El Dorado Hills. The population of El Dorado Hills has grown rapidly in the last few decades. The residential area of El Dorado Hills is about 28 square miles.

There are about 800 students and 50 to 55 teachers and staff members at Rolling Hills Middle School. At Silva Valley Elementary School there are about 650 students and 49 teachers and staff members. Jackson Elementary School is reducing its size, and next fall there are expected to be about 470 students and 35 teachers and staff members. According to the California Department of Education, at the nearby Oak Ridge High School, there were reportedly 1,829 students and 87 staff members for the 2003-2004 school year.

There are 26 full-time and about 8 part-time year-round staff members at the CSD offices at the Community Park. There are seasonal changes in part-time staff (e.g., life guards) at the Community Park. About 35 to 40 children attend day camp at the Community Park during the school year, and about 150 attend during the summer. The Community Park and the schools have staff who maintain the play areas and the Dirt Embankment. The CSD is responsible for maintaining the New York Creek Nature Trail as well.

6.4.3 Sensitive Environments

Based on review of biological resources maps included in the draft *Environmental Impact Report for the El Dorado County General Plan* as well as the draft *Water Resources Development and Management Plan* for El Dorado County, there do not appear to be terrestrial or aquatic sensitive environments or special status species documented within 4 miles of the areas that are the subject of the El Dorado Hills Naturally Occurring Asbestos Multimedia Assessment.

6.5 AIR MIGRATION PATHWAY

In determining the score for the air migration pathway, the HRS evaluates: 1) the likelihood that sources at a site actually have released, or potentially could release, hazardous substances to ambient outdoor air; 2) the characteristics of the hazardous substances that are available for a release (i.e., toxicity, mobility, and quantity); and 3) the people or sensitive environments (targets) who actually have been, or potentially could be, impacted by the release. For the targets component of the evaluation, the HRS focuses on regularly occupied residences, schools, and workplaces within 4 miles of the site. Transient populations, such as customers and travelers passing through the area, are not counted.

6.5.1 Release of Asbestos to Air

The START collected activity-based air samples containing elevated levels of asbestos (i.e., relative to ambient reference air samples that were collected during the same time periods). Table 6-1 (Summary of Sample Results) shows a comparison of the results from the personal air monitors with results from ambient reference air samples collected simultaneously. The table shows 1) the ratio of the average personal asbestos exposure measurement to the average ambient air asbestos concentration measured simultaneously in the same general area, 2) the average personal asbestos exposure concentration as measured by the personal samplers during the simulated activity, and 3) the average concentration of asbestos measured in nearby ambient air at the same time the simulated activity was taking place. For most scenarios this value is the average asbestos concentration from five fixed air sample pumps collecting nearby ambient air on the same day each activity was occurring. Numeric ratios are presented only for those scenarios where the elevated exposure was determined to be significant by the Z-test statistical procedure specified in the **Asbestos Hazardous Emergency Response Act** (AHERA) regulations (40 CFR Part 763; October 30, 1987) covering asbestos in schools. The results showed that personal exposure levels of asbestos were significantly higher during most sports and play activities as compared to nearby asbestos air samples taken outside the areas of activity.

Notes:
Statistical significance of elevated exposure determined by Z-test (AHERA) - "NS" = not significant
[1] PCME fibers = fibers longer than 5 microns with a width between 0.25 and 3 microns, and an aspect ratio (length to width) greater than 3:1
[2] "AHERA structures" = structures longer than 0.5 microns with an aspect ratio greater than 3:1 (Note this differs somewhat from the strict AHERA fiber definition.)
[3] Ratio = average asbestos concentration from personal samples collected during simulated activity divided by the average asbestos concentration from "reference" samples collected
[4] Fiber counts are from direct analysis of PCM filters using ISO 10312 procedure.
[5] Reference Concentration refers to the average asbestos concentration measured on the same day by 5 stationary monitoring stations.
These reference stations were located in the general study area, but outside of the zone of influence by the activity.
[6] f/cc = fibers per cubic centimeter
[7] s/cc = structures per cubic centimeter

6.5.2 Population

See discussion of population for the soil exposure pathway in Section 6.4.2.

6.5.3 Sensitive Environments

See discussion of sensitive environments for the soil exposure pathway in Section 6.4.3.

7 Emergency Response Considerations

The National Contingency Plan (40 CFR 300.415 (b) (2)), authorizes the U.S. EPA to consider emergency response actions at sites that pose an imminent threat to human health or the environment. U.S. EPA is continuing to evaluate whether asbestos in disturbed soils at the locations that are the subject of this PA/SI poses an imminent threat requiring mitigative measures.

The U.S. EPA has met with local, state, and federal agencies; the El Dorado Hills Community Services District; and the schools to discuss preliminary results from the sampling. The U.S. EPA has initiated efforts to convene a science advisory panel of health and asbestos experts to evaluate the data and answer a series of questions about the significance of the exposures.

8 Summary

To assess the potential for exposure from naturally occurring asbestos present in soils that have been disturbed, the U.S. Environmental Protection Agency (U.S. EPA), Region IX, tasked the Ecology and Environment, Inc., (E & E) Superfund Technical Assessment and Response Team (START) to conduct a multimedia assessment of community areas and schools in El Dorado Hills in El Dorado County, California.

The START collected activity-based air samples, reference air samples, and soil samples at and around the following areas in El Dorado Hills:

- The El Dorado Hills Community Park, including several play areas and the New York Creek Nature Trail;
- Silva Valley Elementary School;
- Jackson Elementary School;
- Rolling Hills Middle School, including the dirt embankment inside the school's eastern boundary (Dirt Embankment); and
- An unpaved lot used for parking on public property adjacent to and in front of Rolling Hills Middle School (Dirt Parking Area).

The most significant HRS factors associated with the El Dorado Hills Naturally Occurring Asbestos Multimedia Assessment site are as follows:

- Asbestos is known to be naturally occurring in soils in El Dorado Hills.
- Activity-based sampling through disturbing soils at schools and recreation areas within El Dorado Hills shows the presence of asbestos at elevated levels in air at breathing heights for children and adults.
- In addition to asbestos that occurs naturally in soil, asbestos may be present in non-native soils used as “infield mix” on some or all of the playing fields that were studied.

MANAGING SURFACE WATER-GROUNDWATER TO RESTORE FALL FLOWS IN THE COSUMNES RIVER

Title	Managing Surface Water-Groundwater to Restore Fall Flows in the Cosumnes River
Publication Type	Journal Article
Year of Publication	2004
Authors	Fleckenstein J, Anderson M, Fogg G, Mount JF
Journal	ASCE Journal of Water Resources Planning and Management
Volume	130
Issue	4
Date Published	06/04
ISSN	0733-9496/2004/4-301-310
Abstract	Declining fall flows are limiting the ability of the Cosumnes River to support large fall runs of Chinook salmon. Management scenarios linking surface water and groundwater alternatives to provide sufficient fall flows are examined using groundwater flow and channel routing models. Results show that groundwater overdraft in the basin has converted the river to a predominantly losing stream, practically eliminating base flows. Management alternatives to increase net recharge (for example, pumping reductions) were examined along with surface water augmentation options. Using a minimum depth standard for fish passage, average surface water flow deficits were computed for the migration period of Chinook salmon. Groundwater deficits were evaluated by comparing simulated current groundwater conditions with conditions under various scenarios. Increases in net recharge on the order of 200 to 300 million m3/year would be required to reconnect the regional aquifer with the channel and in turn reestablish perennial base flows. Options that combine surface water augmentation with groundwater management are most likely to ensure sufficient river flows in the short term and to support long-term restoration of regional groundwater levels.

INTRODUCTION

The City of Folsom and the U.S. Army Corps of Engineers are preparing an Environmental Impact Report/Environmental Impact Statement for the proposed Folsom Specific Plan Area (Folsom SPA) development south of U.S. Highway 50.[1] The Folsom SPA qualifies as a "project" under California Water Code (CWC) § 10912 because it is a proposed residential development project of more than 500 units.[2] Pursuant to CWC § 10910 (b), the City of Folsom has identified two public water systems that will serve the project – the City of Folsom and El Dorado Irrigation District (EID).[3] Both the City of Folsom and EID are public water systems under CWC § 10912 because they both operate systems for providing piped water for public consumption to more than 3,000 service connections. Procedurally, the City of Folsom, as the land-use agency responsible for the Folsom SPA, and has prepared the Folsom SPA Water Supply Assessment (Folsom SPA WSA) for approval by both the Folsom City Council and EID's Board of Directors as the respective governing body of each public water system that will provide water to the project.[4]

Because the City of Folsom and EID are public water systems that may provide water service to the Folsom SPA and neither included the Folsom SPA in their respective 2005 UWMPs, the City of Folsom and EID have prepared this Folsom SPA WSA.[5] This Folsom SPA WSA determines whether the total projected water supplies for the Folsom SPA during normal, single dry, and multiple dry water years during a 20-year time period,

[1] Section 21151.9 of the Public Resources Code requires that any proposed "project" comply with California Water Code (CWC) sections 10910, et seq. Specifically, CWC § 10910(a) provides that "Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act ... shall comply with this part." CWC § 10912(a)(1) defines a "project" as "A proposed residential development of more than 500 dwelling units."

[2] As explained in Section 1.1, there are two project alternatives analyzed in the Folsom SPA WSA – the Proposed Project Alternative (Folsom SPA – PPA) and the Reduced Hillside Development Alternative (Folsom SPA – RHA). Both exceed the 500 unit threshold and therefore both qualify as a "project" pursuant to CWC § 10912.

[3] CWC § 10910(b) provides that "The city or county, at the time that it determines whether an environmental impact report ... is required for any project subject to the California Environmental Quality Act ..., shall identify any water system that is, ..., a public water system, as defined in Section 10912, that may supply water for the project.

[4] Pursuant to CWC § 10910(g)(1) "The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision [10910] (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting."

[5] Both the City of Folsom and EID are public water systems that may serve the project and would therefore be responsible for preparation of a water supply assessment.

will meet the projected Folsom SPA water demand.[6] As discussed in more detail, this WSA concludes that the total projected water supplies for the Folsom SPA are sufficient to meet the SPA's projected water demand, for both the Folsom SPA Proposed Project Alternative (Folsom SPA – PPA) and the Folsom SPA Reduced Hillside Development Alternative (Folsom SPA – RHA), during normal, single dry and multiple dry water years during a 20-year time period.

Under CWC sections 10910(a) and 10912(a), the project to be analyzed in a WSA is the project that is subject to review under the California Environmental Quality Act (Public Resources Code sections 21100-21177 (CEQA)). Under CEQA, project alternatives are not equivalent to the proposed project. (See Public Resources Code § 21100(b).)[7]

The EIR/EIS that this WSA supports is subject to the National Environmental Policy Act (42 USC 4321 et seq. (NEPA)), as well as CEQA. The EIR/EIS therefore analyzes project alternatives in the level of detail required by NEPA. (See 40 CFR § 1502.14.), The Folsom SPA – RHA would involve more residential units than the Folsom SPA. Because of this fact and because the EIR/EIS analyzes that alternative in the level of detail required by NEPA, out of an abundance of caution, the City in this WSA analyzes the Folsom SPA – RHA's water demands in comparison to the City's proposed water supplies even though CWC sections 10910(a) and 10912(a) do not require the City to prepare a WSA for the Folsom SPA – RHA or for the other land-use alternatives that the EIR/EIS considers. The other land-use alternatives considered by the EIR/EIS involve an equal or lower number of residential units and greater number of acres of non-irrigated open space than the Folsom SPA – PPA and therefore do not raise the same water-supply issues as the Folsom SPA – RHA.

Section 1 provides a description of the planned land uses for the Folsom SPA - PPA. **Section 2** provides a water demand projection methodology for both the Folsom SPA – PPA and the Folsom SPA – RHA and the water demand projection for the Folsom SPA – PPA. **Section 3** analyzes the water supply proposed for the Folsom SPA, assuming the same supply will be available regardless of the ultimate land-use alternative selected.

---

[6]CWC § 10910(c)(4) provides that "If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, ..., the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses."

[7] Public Resources Code § 21100(b) provides, in relevant part: "The environmental impact report shall include a detailed statement setting forth all of the following . . . (4) Alternatives to the proposed project."

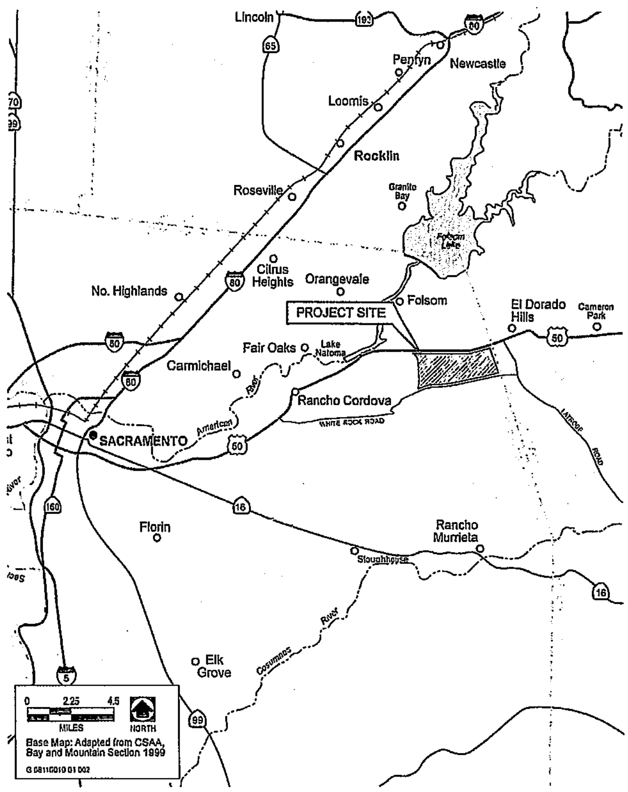
Section 4 presents a sufficiency analysis for the Folsom SPA – PPA. **Section 5** describes the Folsom SPA – RHA land-use plan. **Section 6** contains a unique water demand projection for the Folsom SPA – RHA. **Section 7** summarizes the water supply availability conclusions from **Section 3**. **Section 8** provides a sufficiency analysis for the Folsom SPA – RHA.

SECTION 1 PROJECT DESCRIPTION

As shown in **Figure 1**, the Folsom SPA is located in eastern Sacramento County south of U.S. Highway 50.[8] Currently, the land in the Folsom SPA is comprised of open non-irrigated natural grass hills with some native oak stands. Alder Creek runs through the project site along a portion of the site's northern boundary. The project site is surrounded by agricultural and rural residential land uses to the south. West of the project site is land which is owned by the Aerojet-General Corporation that the company plans to develop for residential and commercial uses. The eastern boundary is the El Dorado County line. The project site is located within the City of Folsom's sphere of influence and planning area boundary.

[8] General project land-use description as provided in Notice of Preparation of a Joint Draft Environmental Impact Report/Environmental Impact Statement for the Folsom South of U.S. Highway 50 Specific Plan Project, September 12, 2008. (Folsom SPA NOP)

Figure 1[9]
Folsom Specific Plan Area
Regional Location Map



1.1 Project Land Uses

Generally, at buildout, both the Folsom SPA – PPA and Folsom SPA – RHA envision a significant mixed-use project on approximately 3,500 acres, including approximately 1,500 acres of residential land uses, 1,000 acres of non-residential development, and 1,000 acres of open space. The City of Folsom will consider applying to the Sacramento County Local Agency Formation Commission (LAFCO) to annex the Folsom SPA to the City. But as indicated in the Introduction, the Folsom SPA lies within two separate retail water service jurisdictions. Most of the total Folsom SPA is within the City of Folsom's

[9] Exhibit 1, Folsom SPA NOP.

water service area and a portion is within the El Dorado Irrigation District's (EID) water service area.[10]

1.1.1 Folsom SPA - PPA Land Uses

The Folsom SPA - PPA land uses are presented in **Table 1-1**, and the land-use areas are depicted graphically in **Appendix B**. Total project acreage will be 3,510 acres, including a maximum of 10,210 dwelling units.

Table 1-1
Folsom SPA - PPA
Land Uses[11]

Land Use ID	Area, acres	Dwelling Unit Density DU/acre	Dwelling Units
Single-Family (SF)	557.8	3.0	1,687

For the purpose of understanding the extent of the water that the Folsom SPA - PPA could demand from EID, **Table 1-2** provides the land use assumptions for the portion of the Folsom SPA - PPA located in the EID service area. EID's service area portion of the Folsom SPA - PPA encompasses approximately 172 acres and is projected to realize

[10] Sacramento LAFCO approved the City of Folsom Sphere of Influence Amendment Application in 2001 by adopting Resolution No. LAFC 1196. A copy of Resolution No. LAFC 1196 is attached as **Appendix A**.
[11] From MacKay and Somps, Land Use Summary, May 20, 2009. A copy of the Land Use Summary is attached as **Appendix C**. This is an update from the Specific Plan Land Uses presented in Table 1 of the Folsom SPA NOP.

construction of 530 dwelling units. For comparison, **Table 1-3** provides the land uses and associated dwelling units planned for the City of Folsom's water service area. This Folsom SPA WSA identifies a source of water and conveyance facilities that will be used to deliver water supplies to both service areas. The water supply identified for the entire project is an entirely new source for both service areas and will therefore not impact any existing water supplies in the City of Folsom or EID service areas.

As mentioned above, the planned water supply for the Folsom SPA is separate from the water supplies currently serving the City of Folsom's and EID's existing service areas. Under the Folsom SPA WSA, the City of Folsom will control the wholesale water supply for the entire Folsom SPA. It will also control the retail water supply and associated infrastructure in the City of Folsom's portion of the Folsom SPA. All water facilities and retail water supplies delivered in EID's portion of the Folsom SPA will be controlled by EID.

Water Code section 10910 requires the sufficiency of water demands to be assessed during a twenty year period. Accordingly, the Folsom SPA WSA assumes construction of the necessary water infrastructure will be completed by 2013 in time to meet water demands for the Folsom SPA – PPA. Full water demand in the Folsom SPA – PPA will be achieved by 2033 upon project completion.

SECTION 2 FOLSOM SPA – PPA WATER DEMAND ESTIMATE

2.1 FOLSOM SPA DEMAND PROJECTION METHODOLOGY

Section 2 provides a water demand projection methodology for both the Folsom SPA – PPA and Folsom SPA – RHA and the water demand projection for the Folsom SPA - PPA.[12] **Section 2.1** provides a basis for the unit demand factors for the water demand estimates by reviewing the unit water demand factors of both the City of Folsom and other water purveyors in the region, as well as additional conservation drivers. Both the historic demand factor assessment and the conservation drivers provide a foundation for the water demand projection for the Folsom SPA – PPA contained in **Section 2.2** and the Folsom SPA – RHA projection contained in **Section 6.1**. **Section 2.3** identifies potential Folsom SPA – PPA demands that could be served by a non-potable supply. Neither the City of Folsom nor EID has developed a non-potable supply to deliver to the Folsom SPA. As such, this water supply assessment does not rely on a non-potable supply to meet any portion of the water demand projected for either the Folsom SPA – PPA.[13] **Section 2.4** provides the water demand projection for the Folsom SPA – PPA used for the sufficiency analysis in **Section 4**.

2.1.1 Historic Demand Factors

The demand projections for the Folsom SPA – PPA and Folsom SPA - RHA are based upon review of historic City of Folsom meter data, evaluation of meter data in neighboring water service jurisdictions and pending conservation mandates. The City of Folsom's 2005 Urban Water Management Plan (2005 UWMP) contains the most current unit water demand factors used by the City of Folsom to project land-use water demands. The unit demand factors used in the 2005 UWMP represent historic conditions with a range of housing ages, plumbing fixtures, and irrigation systems, and therefore do not reflect demand conditions for completely new construction. Since the 2005 UWMP was adopted, the City of Folsom has completed a five-year single-family residential meter reading project that has validated the unit demand factors used in the 2005 UWMP for the City's existing service areas. Specifically, in the 2005 UWMP, the

[12] CWC § 10910(c)(4) provides that "If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses."
